

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Capt. Harris Laning, United States Navy.....	3418
Commander W. S. Pye, United States Navy.....	3420

NAVAL INVESTIGATION.

THURSDAY, APRIL 29, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Keyes, Pittman, and Trammell.

STATEMENT OF REAR ADMIRAL JOSIAH S. McKEAN—Resumed.

The CHAIRMAN. The committee will come to order. Admiral McKean, will you proceed?

Admiral McKEAN. Senator, I have here, brought at the request of the Acting Chief of Operations, Capt. Hutchins, this large table which contains in this form the information from the records that you asked for yesterday. There may be some slight errors in this tabulation, but that is the whole matter in reply to your inquiry. I am surprised that they got it out as rapidly as they did. That was a big job.

(The table referred to is here printed in full in the record as follows:)

Admiral McKEAN. When the hearing closed yesterday, in taking up the different types I had gotten along to the subject of tugs. Capt. Pratt in his testimony submitted this list of tugs available on the Atlantic coast, and of the number of seagoing tugs in European waters and the number of seagoing tugs in home waters.

The CHAIRMAN. That had better go in at this time, anyway. (The table referred to is here printed in full in the record as follows:)

Number of seagoing tugs in European waters.

June 1, 1917.....	None.
July 1, 1917.....	None.
Aug. 1, 1917.....	None.
Sept. 1, 1917.....	None.
Oct. 1, 1917.....	7
Nov. 1, 1917.....	8
Dec. 1, 1917.....	8
Jan. 1, 1918.....	8

Number of seagoing tugs in home waters.

June 1, 1917.....	27
July 1, 1917.....	30
Aug. 1, 1917.....	32
Sept. 1, 1917.....	42
Oct. 1, 1917.....	35
Nov. 1, 1917.....	35
Dec. 1, 1917.....	40
Jan. 1, 1918.....	43

Admiral McKEAN. Admiral Sims, in his testimony, makes loud and strenuous comments as to delays of the department in sending him tugs for use in the European war, and states that the veriest amateur who has been in our ports up and down the coast knew that there were almost innumerable tugs in every one of the ports, because he had seen them.

It would not have been surprising for us to know that a layman did not understand why suitable tugs were not available because to him a tug is a tug, but even with my knowledge of Admiral Sims's lack of interest and familiarity with the material side of the Navy, I must say I was surprised at the form in which he put his statement to the committee, because it, in my opinion, without explanation, was entirely misleading. Of the hundreds of tugs along our coast, Admiral Sims should have known that only a few of them were really seagoing tugs; that these very few were links, and important links, in the transportation system of our country, and their numbers were strictly limited to the absolute commercial needs for water transportation, largely of fuel, up and down the coast. He should also have known, as it was a matter of common knowledge to everyone in the room, I suppose, that one of the most serious questions that we had at home to face was the shortage of fuel, especially in the New York and New England districts, and that there were months at a time when it was just touch and go whether we could keep power plants running; whether in some cases we would not have to shut down munitions factories for lack of power or fuel. As you gentlemen know, it at times got down to a point where we had to use our naval reserve of coal to heat and light municipalities, to keep hospitals and other institutions from freezing, and Admiral Sims should have known that the supplying of these communities under the conditions of our railroad transportation at the time made it absolutely essential, both from the point of view of our own needs, as well as those of our allies, that this fuel must be shipped by water, and that these tugs were absolutely essential to this transportation.

Even then, should a tug be purchased, commandeered, or ordered, there was a loud and forceful protest from Senators and Congressmen in the districts affected, always backed by an official protest from the Fuel Administration, Food Administration, or Railroad Administration—often all three at a time.

I think that some of the members of this subcommittee probably had experiences of their own in that line. I do not recall which ones I saw up there, but I think I have seen members of the committee when it was absolutely vital that we must transport that fuel to New England and other places along the coast.

Senator TRAMMELL. I had some experience of that kind, threatening to close down municipal plants on account of it.

Admiral McKEAN. We did buy tugs carefully selected from places where their absence would do the least harm. We did alter them for service overseas as rapidly as possible. We did send them as rapidly as old ones could be spared or new ones could be built. As an illustration of the situation, we bought some tugs that were, of course, commandeered, that had been used to transport fuel, and we were compelled, in justice to the owners, to purchase a number of

old barges of a type which we did not really seriously need. We had to do that in fairness to the owners of the tugs. We used them; but we put him out of business. We used the barges for storage purposes, even if we could not tow those old barges. We had to take them off his hands when we took his tugs away because we stopped his business, and it was not fair to leave those tugs on his hands, out of use.

As shown in the memorandum to be submitted, there were eight tugs in European waters by April 6, 1918.

TRAWLERS.

In addition to the tugs given above, we also sent a number of fishing trawlers which could be used for tugs in emergencies, and in securing these vessels we had great difficulty not only with the local interests' representatives. Senators and Congressmen who protested against their being commandeered, but with the Food Administration who insisted that the fish these trawlers were catching were essential to the food supply of the United States, to enable us to furnish other types of food to our Allies in Europe.

MINE SWEEPERS.

In the first year we also sent four mine sweepers which, in emergencies, could be used for tugs, and we fitted out certain salvage vessels and sent them to Europe for salvage and wrecking purposes, included in which is towing of disabled vessels.

As to the hundreds of tugs that Admiral Sims and everyone else can see in our ports, they were high pressure atmospheric exhaust harbor craft, and numerous as they were there was nothing in the line of the high cost of living that I know of that went up like the price of tugs, because of the demands of our overseas shipping, which was utterly and entirely dependent for efficient turn around upon the local tugs and barges in the ports from which they were operating. These tugs were absolutely useless for overseas work unless refitted with condensers, etc., to provide fresh water for use in their boilers. Most of them were so small that the extra machinery could not be installed and very few of them were large enough to permit of storage of the extra fuel necessary to permit them to go to sea in safety. Very few of them were really seaworthy craft at all, and the committee's attention is called to the fact that what apparently Admiral Sims took to be hundreds of available tugs to meet his needs, reduces to tens, and these tens are reduced to units when you consider those available and suitable or which could be made suitable for the service in which he contemplated using them.

The committee's attention is also called to the fact that a number of those sent, converted from fishermen, etc., were so badly racked by the service and the guns and other weights placed upon them for war service which they had not been designed to carry, that they sank and men were lost from them; that others, although they did not sink, could not be brought home because of their condition.

There is an item that Capt. Pratt referred to in reference to tugs, but I do not know that he brought it out so as to impress it. A tug is a commercial proposition, not a war proposition, and while he

brought out very distinctly that it was a commercial proposition and a link in our transportation system on this side, I want to accent the fact that the use they proposed to make of them over there was for salvage and the facilitating of British commerce, which only indirectly affected the war.

One of the purposes of the testimony here, from my point of view, is to show what we did do in the Navy, some of us, and what we did not do has been shown up already.

In this connection I want to call attention to the development of the communications system, and I attach a short history of the development of naval communications, and I think everyone will readily appreciate its importance, as however perfect your plans, your system of collecting information of the enemy, or organization of your forces, they all fall dead unless you have a reliable, complete, and efficient system of communications, tying all together.

This sketch is by Capt. Bryant, of the Naval Communications Service, and shows its development and the consolidation of all the systems of communication—cable, telephone, telegraph, radio, etc., into one office and one system.

The surprising thing, to me, and disappointing, is that the oldest system of communication, written, is in a different office and a different file room, and I think the whole system should be consolidated in one under the director of naval communications. This history I will not read. It is very interesting, and it will be put in as a part of the record, and it shows the development. When the armistice was signed, we had 3,400 men under instruction, radio operators. A total of about 7,000 operators completed their training. That, as big as it was, does not meet the commercial demands to-day; but every radio operator that we have in the fleet whose time is up leaves us and goes to the Shipping Board or to private shipping companies, because they have to carry these radio operators, and we are doing to-day with radio just what we did 30 years ago with electricians, we are training the fundamental force in a new business. It is a good job, but it is keeping us mighty hard up.

The CHAIRMAN. And as soon as they get trained they leave you?

Admiral McKEAN. Yes, sir. My division of battleships, which is at Bremerton, is having the service entirely remodeled, and we will have the most complete and entirely satisfactory radio communications system, including the radio telephone on board all ships—alternative systems for use in battle—and I will have one radio officer on board of each ship, and he knows the plant, and the average is one radio operator that knows the plant. We have run schools; we have done everything. We are making telegraph operators. We have got them all ready for that, but it will be months before we have a completely organized radio operating force on any one of those ships. We will use a part of the plant at a time, one unit. We will use this unit or that unit, but when it comes to operating the whole plant we can not touch it. It will take us months actually at sea using them before those men become real radio operators.

Senator KEYES. The reason they are leaving you, Admiral, is on account of the fact that they can get better pay in other service? It is a question of pay, is it not?

Admiral McKEAN. A question of pay. And when they go aboard a merchant ship there is nobody on the merchant ship that knows

anything about radio, so that the radio operator springs rank on them, and he is made an officer; and then he is a gentleman of leisure, so far as interference is concerned, because nobody else knows enough about it to interfere with him. But he is entitled to the pay, and he is a skilled and trained man. But with 48 of them in the different units on my ship for use in battle, we could not afford that. Uncle Sam could not stand for that.

The CHAIRMAN. Has there been any additional pay provided in the Navy?

Admiral McKEAN. No, sir. I think that in the bill that is now before Congress the radio operators have been put up, but it is not anything like what the pay is outside. We will fill these gaps when we get enough men trained. Capt. Bryant says in this report:

The year before the war there were handled approximately 125,000 dispatches from the Navy Department. These dispatches averaged about 25 words each. From April 6, 1918, to April 6, 1919, approximately 1,000,000 dispatches, of an average of about 30 words each, were handled from the Navy Department alone. Another work which naturally fell to this was the censorship. That was controlled from the central office in Washington, and there were 24 stations where we had to have a censorship control.

The report of Capt. Bryant is as follows:

A-1.

THE UNITED STATES NAVAL COMMUNICATION SERVICE.

[By Capt. S. W. Bryant, U. S. Navy, Acting Director, Naval Communication Service, Navy Department. Presented at a joint meeting of the Institute and the Philadelphia Section, American Institute of Electrical Engineers, held Wednesday, Oct. 15, 1919.]

In 1912 the so-called Naval Radio Service was established, with Capt. Bullard as the first superintendent. It was apparent that the material progress made in radio was at that time much further advanced than the administrative and operating features, so that efforts were concentrated immediately on a plan for the establishment of a service of communication that would serve the needs of our fleets and merchant marine to best advantage, both in time of war and in time of peace. We had a number of stations along our coast that were individually very good, and materially good; and so far as their operation was concerned, were very good; but they were not connected up in such a way as to serve the interests of the fleet to the best advantage.

The plan outlined provided for continuous communication with our fleets and among the various subdivisions of the fleets, as well as for the coordination of all naval communication facilities so as to provide a rapid and reliable interchange of information between all naval organizations afloat and ashore.

The advisability of combining all naval communication activities—that is, telegraph, telephone, cable, etc., and radio—under one head was soon appreciated by the Navy Department, and the name of this office of the department was changed from the 'Naval Radio Service' to the 'Naval Communication Service,' and it was placed under the Chief of Naval Operations where, logically, it belonged. It consists of three main divisions, viz., Atlantic, Pacific, and Philippines, and each division is subdivided into districts.

A very valuable experiment was carried out by the Navy Department in May, 1916, in which all the naval stations within the continental limits of the United States were connected up to a central telephone switchboard in the Navy Department, and by means of which instant telephonic communication could be had between the various naval stations and the Navy Department, and also among the stations themselves. This was made possible through the assistance of the American Telephone & Telegraph Co., and its value later on, when this country declared war against Germany, was clearly proven. It was during this test that the commandant of the navy yard, Mare Island, Calif., talked by telephone to the commanding officer of the battleship *New Hampshire*, which was then at sea off the Virginia Capes. The commandant's remarks came by long-distance telephone from Mare Island to Arlington, where the transmitting station was installed, and from there out to the *New Hampshire* off the Virginia Capes.

The greatest value derived from this experiment, aside from the knowledge that such rapid communication by telephone was available to the Navy Department, was the fact that all of the apparatus necessary was specially marked and could be placed in operating condition on 24 hours' notice. As a result, the interior communications of the country, so far as naval needs were concerned, were, on the outbreak of war, in excellent operating condition, and made the task of the Navy Department, in communicating its instructions and orders to the various naval stations, a comparatively simple one at the time of the declaration of war.

On January 1, 1917, the Naval Communication Service operated 55 radio stations, distributed along the coast of the United States and its possessions. Naval vessels were equipped so that they could receive only one message at a time. Not all of the American merchant vessels were equipped with radio apparatus, some were equipped with poorly designed radio apparatus, and none of their radio operators was proficient in the procedure of communications during war. The Navy had only 1,031 radio operators in its service.

The radio technical equipment of the Navy was as good as any in general use in the United States at the time, but the demands for communication proved that the technical equipment would have to be increased and improved to conduct all of the necessary communication demanded in time of war.

At the beginning of the war the demands for quick communication increased by leaps and bounds. It was found necessary to communicate with ships in all parts of the world, while at the same time to maintain long-distance communications between the Navy Department and our outlying possessions and expeditionary forces. It was necessary to maintain continuous and rapid communication between the Navy Department and Europe, South America, Central America, West Indies, Pacific coast, Hawaiian Islands, Guam, Tutuila and the Far East. The most important centers of communications were at Cavite, P. I., Hawaiian Islands, Canal Zone, Washington, D. C., and the capitals of the allied nations in Europe.

To meet the demands for communication, the Navy's facilities were greatly and rapidly increased, and means were provided for collecting and disseminating information to every part of our coast and to naval vessels in Europe, South America, and the Far East.

The Navy took over and operated 59 commercial stations. At the same time the several privately-owned stations were closed, including all the stations operated by the amateurs, which were not necessary nor desirable for use during the war. Sixty-seven land radio stations were built by the Navy during the war, all equipped with the best apparatus, thus more than doubling its radio facilities on shore.

Naval vessels were equipped with improved apparatus, so that when the armistice was signed battleships were able to receive four messages simultaneously and transmit three. The commander in chief of the fleet could talk to the captains of vessels in the fleet; while at the same time the various ships of the fleet could communicate with one another. In addition, and at the same time, airplanes could communicate with their respective battleship units. None but a naval officer can appreciate the value of such a system or how much such a system facilitated the freedom of the movement of the fleet.

The Navy Department equipped all American merchant vessels with modern apparatus and furnished operators for them, so that these merchant ships could receive messages at any time of the day and transmit messages at long distances in case of distress.

The Navy had to train most of its radio men, because the radio amateurs in this country were soon incorporated in the Army and Navy. These operators were trained at Harvard. In June, 1917, there were 350 students under instruction. When the armistice was signed there were 3,400 men under instruction, and operators were being graduated at the rate of about 200 a week. A total of about 7,000 operators completed their training. In addition to the radio operators, it was necessary to train officers for communication duties on board the ships. At the time the armistice was signed each ship of the Navy had a communication officer and each merchant ship had a chief petty officer who performed communication duties and, therefore, relieved the master of the ship from a very vexatious duty.

The year before the war there was handled approximately 125,000 dispatches from the Navy Department. These dispatches averaged about 25 words each.

From April 6, 1918, to April 6, 1919, approximately 1,000,000 dispatches, of an average of about 30 words each, were handled from the Navy Department alone. Some of these dispatches, on account of the necessity of broad-casting, were sent twice in order to insure their delivery.

As it was assumed that the use of radio apparatus by ships at sea enabled German submarines to ascertain, more or less accurately, the movements of such ships, communi-

cation by radio from merchant ships was discontinued except in case of emergency. Men-of-war were cautioned not to use their radio apparatus unless necessary. However, it was very necessary that information should be received on shore regarding the movements of the enemy, and that the consequent orders to ships at sea should be transmitted expeditiously. Therefore, in order to direct the movements of convoys, and to transmit information to naval vessels regarding the enemy, and to issue orders to both merchant ships and naval vessels, a comprehensive system of transmission from shore was organized with the view of making it unnecessary for ships at sea to use their radio apparatus.

All merchant vessels listened for their orders from certain designated shore stations during certain hours of the day. These messages were sent by high-power and low-power stations, depending on the distance of the ship from shore. Naval vessels intercepted messages from shore stations at all hours of the day. In order to send a message to a naval vessel at sea, it was necessary only to transmit from certain shore stations on a designated wave length. It soon became evident that this was a very sure means of communication. Many times, 50 or 60 messages were transmitted to sea simultaneously, all destined for different classes of vessels, and they were received by ships in accordance with the plan.

The foregoing system demonstrated that ships at sea could be warned of mines and submarines, and their movements directed without the necessity of their using their own radio apparatus. The system was automatic to such an extent that it was almost certain that a vessel could be reached at any time.

In order to check the radio work of merchant vessels, a comprehensive system of inspection was organized, both in the United States and abroad. Every merchant vessel that came into port received a thorough inspection of its radio apparatus, and the radio operators were examined and thoroughly instructed. Any mistake indicated in the log books was investigated and the operator instructed as to the correct method of handling such cases.

Besides inspections, the Navy maintained a comprehensive system both at home and abroad of radio repair stations. Any radio apparatus on board ship which had broken down was repaired when the ship came to port.

When the United States entered the war it was noticed that the Central Powers were conducting a comprehensive scheme of propaganda by wireless. Counteracting this were the systems operating from France and England. The United States had no means of distributing American news throughout the world. Therefore, it was decided to use the transoceanic system of the Navy to distribute news of a reliable nature from the United States. The transatlantic stations transmitted this press news to Europe and South America. Naval vessels in South America received the press and distributed it to the local papers in those countries. The European news was distributed by Admiral Sims's headquarters and redistributed to the various capitals of Europe, including points in Russia. The Central American news was broadcasted from the Navy's high-power station in the Canal Zone, and was received in the northern part of South America and Central America and Mexico. News was distributed to the Philippines, Japan, China, and Siberia, through the Navy's transpacific high-power stations. These reports were received in the Philippines, Shanghai, Vladivostok, and Japan, and distributed to the local papers in those countries.

During the war it was found exceedingly difficult to locate persons in the United States who were using radio apparatus unlawfully. Also, when the German submarines began operations off the United States in June, 1918, it was found that, although the radio signals of the submarines were intercepted by naval radio stations along the coast, there was no efficient devices by which the exact location of the submarines could be ascertained from their radio signals.

It was found that enemy submarines used their radio apparatus promiscuously, and that they operated in pairs in order that they could fix the position of their prey by means of bearings. Such procedure necessitated the use of radio.

In order to counteract the foregoing situation, the Navy developed a comprehensive system of radio compasses, by means of which the bearing or direction of the enemy's signals could be obtained. Also, all signals were copied, so that every time a message was sent the Navy could trace it. Shortly afterwards, it was noted that the submarines did not use their radio, and it is believed that the Navy's shore radio-compass system robbed the enemy of a vital weapon, as the radio compass not only made it dangerous for the enemy to use their radio for communication purposes between one another, but also prevented them from using it for sending decoy distress messages.

Later the Secretary of the Navy "in a plan to hasten the progress of troop ships" authorized the construction of 15 additional radio-compass stations, making a total of 34 on the Atlantic and Gulf coasts. These radio-compass stations were at harbor entrances and enabled ships at sea to enter port without consequent delays due to

thick weather and fog. This was a very important item in the war, as every minute counted in a ship's voyage.

In November, 1918, the telegraph and telephone division was in charge of a lieutenant commander, with 5 officers, 12 chief petty officers, and an enlisted personnel of about 130. The telegraph system of the Navy Department at that time included wires from Galveston, Tex., to Bar Harbor, Me. The leased telephone wires of the Navy Department extended from Norfolk, Va., to Portsmouth, N. H., there being seven private telephones from the department to New York alone. The telegraph office of the Navy Department was handling 4,000 messages a day, and the Navy telephone exchange was handling 18,000 telephone calls per day.

The censorship of all cables was controlled from this office through the following branch offices:

Now I come to rather the most difficult subject in the whole outfit, that of aviation. I have here a number of papers which show what the Navy Department did with aeronautics prior to the war; but before going into the papers I have a few remarks in general.

The dreaming of dreams as to air navigation, air battleships, cruisers, scouts, destroyers, torpedo planes, bombers, mine planters, etc., is easy. We have all indulged in this delightful pastime, but the production and development of these entirely new craft, using a new medium, the air, requiring new materials, new uses of old materials, the development of a new science, the training in a new art, the education of new designers, the training of a number of new types of mechanics, etc., could not be done and was not done instantaneously by any nation, even under the stress of war, and we started behind.

Admiral Fiske as a fireside critic produced more aircraft on paper than he did actual aircraft as aid for operations.

He had splendid ideas, if we could only have realized them. Nobody did.

Admiral Fullam has seen a large number of training machines both land and sea types operating during and since the war in the ideal conditions for school work at San Diego. I refer to these two officers by name only because they mentioned aviation particularly in their testimony. He has undoubtedly seen real service type land machines, but school machines and fighting land types are no further apart than the highest type of land machine is from the development as applied to the sea. When the land type designer has completed his work, the sea type designer commences. He takes over the machine that the other man has produced, and then he tries to make the machine suitable to carry the excess weight of the floats, etc., so as to be able

to land on the water, to get off the water and go through the water at high speed without racking and tearing it to pieces, and I am sure that the expert designers will all agree that the designing of the original machine is much simpler than the adapting of the machine to sea use; and the same machine that is a success ashore, when you put the floats and all the gear necessary to operate at sea upon it, is not a success. It takes a good deal more power for the same speed, and she can not be as handy. There are many, many, handicaps. I compare them here. There are millions and millions of people who can walk; very few, comparatively, who can swim.

We might have done more; we might have done it sooner; we might have done what we did do better. But we did the best we knew how with the brains and energy God gave us to work with, and after all the U. S. NC4 was the first heavier-than-air craft to cross the Atlantic; and had it not been for a bit of hard luck the U. S. C3 would, I believe, have been the first lighter-than-air craft to have crossed the ocean.

There was a little bit of a side story on that. The heavier-than-air people had planned a trans-Atlantic flight, and did not expect to have a balloon type of airship. The lighter-than-air people at the last minute developed a combination that made the C-3 an altogether different ship. They wanted to get in the game. We let them go. They did so well, and they got up to Trepassy Bay so soon that the heavier-than-air people were afraid that the glory of the first flight across would be taken away from them; so that they did not think that the C-3 ought to be let go before the heavier-than-air people were allowed to go, and the C-3 people needed rest anyhow, so that we said, "We will hold on so long, and give you a show." We did not want to interfere with a sporting proposition. Then the bad weather conditions and an unexpected gale tore the C-3 to pieces. But she would have successfully crossed the ocean, I believe.

The CHAIRMAN. What was she?

Admiral McKEAN. She was a blimp, a small dirigible.

The CHAIRMAN. A blimp?

Admiral McKEAN. Yes.

These official documents attached show a development that, under the conditions, with our Navy, our Army, and our Allies making demands all of which could not possibly be met, is, in my opinion, really remarkable.

No development could have been completely satisfactory and have fully met the daily increasing and expanding demands.

What was satisfactory to our people on this side and on the other side at the end of one week by Monday morning was out of date, and we had to start all over again. It was a developing, experimental science, and you did not know what a day or a night might bring forth.

The answer to all the aviation criticisms is that aviation heavier than air and lighter than air depends on the motor. That is fundamental. If you have a light enough and powerful enough motor within its weight, you could paste newspapers on it and make it fly. It would go off the ground of itself, almost—just the engine.

Until the Liberty motor had been produced it was impossible for either our Army or Navy to expand to war dimensions. The motors and machines they were using abroad were practically hand fitted.

They had not gotten a quantity production at any time. That was the only thing that would save us, so that we had to produce a standard type of engine that we could produce according to American manufacturing methods, and we had to do our work with machinery. Our men do not know how to fit those things by hand.

And, another thing, had we produced those special types where each engine was a unit, and everything was made to fit it, the number of spare parts we would have had to send abroad would have overloaded all the tonnage that it was possible for us to build at any time. We could not have gotten the stuff across there. We had difficulty as it was. The Liberty motor's first successful trial was on July 4, 1917. That was the type engine. I am informed that there were 1,100 changes made in that engine before it was really a satisfactorily completely standardized product.

In the same way and to the same degree that the Liberty motor was the foundation stone in the development of heavier-than-air craft so was the production of argon gas, in quantity, the real key to successful lighter-than-air work.

These are copies of official documents taken from the files of the department.

The list is as follows:

1. Memorandum on aviation.
2. Annual report on aeronautics.
3. Orders for Capt. Mark L. Bristol.
4. Memorandum of personnel. February 26, 1916.
5. Report "Aeronautics, Navy, 1916," from Bureau of Supplies and Accounts.
6. Indorsement from General Board "Appropriation, 'Aeronautics,'" March 21, 1916.
7. Secretary's letter to General Board as to future of naval aeronautics. April 12, 1916.
8. Memorandum re Pensacola stations. May 15, 1916.
9. Change of orders, commander Air Service. May 25, 1916.
10. "Development of aeronautics," letter from General Board. June 24, 1916.
11. Report from General Board on number of aircraft for naval service November 15, 1918, based on all the information available.
12. Memorandum from Chief of Staff, War Department, re general and local plans for air station defense.
13. Summary of aircraft in use or contracted for. November 27, 1916.
14. From Secretary of War. "Policy with reference to development of certain types of aircraft." December 28, 1916.
15. From Secretary of War. "Defense against air attack." December 29, 1916.
16. Letter from Assistant Secretary, "Army and Navy Board re development of Zeppelin service." January 12, 1917.
17. From Secretary of War re development of Zeppelin service. January 31, 1917.
18. Report of Board of Army and Navy Officers re development of aeronautical service. March 12, 1917.
19. Memorandum. "History of naval aeronautics." June 25, 1917.
20. Memorandum. "Funds appropriated for aviation in the Naval Service." April 3, 1920.
21. Memorandum. "Statistics of aviation personnel and material, 1917 and 1918." April 5, 1920.

The difficulty in the lighter-than-air work is to get a container that will hold gas. The next difficulty is to get a gas that is not explosive or inflammable. Everybody had used hydrogen until argon was discovered, and then they all wanted that, because it was non-inflammable. We found it in the United States, and proceeded to build plants for its production in quantity and ultimately it, or a substitute with similar characteristics, will be the gas used in commercial and military flying, on account of its lack of inflammability. Both of these developments, that of the motor and of the argon.

were American in conception and in execution. They were done under war pressure.

Our expansion in personnel and material is shown in one of these papers. There are also shown the stations, the machines, and personnel operating them in Europe at the time of the armistice.

The CHAIRMAN. Have you submitted a list showing the seaplanes that we had on April 6, 1917, and also later during the war?

Admiral McKEAN. Yes, sir; I have lists here showing the different stages and the development of personnel and material at those times; a sketch history of aviation in the Navy.

These are copies of official documents taken from the files of the department. The first is B-2 [reading]:

'a' For three years prior to July, 1914, aviation was handled as a matter of experiment in the Bureau of Navigation, with small appropriations of approximately \$10,000 per annum.

That was the time that I became responsible for aviation and the development of aviation. It did not belong legitimately to my part of the department, but Admiral Benson and the Secretary did not think we were getting the progress that was to be expected, and they were not satisfied that we knew exactly along what line to go, and in spite of my protest they said I had to take that thing and dig it out to the foundations, and find out where we were going and why, and organize it; and as soon as I got it organized on new lines, and established, and got people trained to take it over, then they would take it off my hands. I did not know much about it. I had been interested in it in a general way. So I sat down and asked myself a lot of questions: Did the Navy need aircraft? If so, why? If we needed aircraft, what kind, heavier-than-air or lighter-than-air, or both? If we needed aircraft, what were we going to do with it? Where were we going to use them? Were we going to use them from ships or shore stations, or both? If we were going to use them from shore stations, how many shore stations should we have; where should they be; how large should they be; how much personnel would be involved? If from ships, what kind of ships; all, or only scouting ships; or would we have to build special ships to operate them from? And in making my estimate of the situation, I worked out the number of questions that I tried to get intelligent answers for, and then shaped up in a short letter to the General Board, not quite so definite and fundamental, A, B, C questions, because I did not want to put them that way to the board. I could ask those questions of myself, but I did not want to ask them of the General Board.

I got out of that a policy which we developed, and along which we worked, and we had then a target to shoot at. Theretofore they had done wonderful work in the way of pioneering work; they had trained a number of officers and men to fly; they had done plane development work, and so forth, and they were flying in machines, that, if I had been in the life insurance business, I would not have insured the life of any man that touched one of them, even on the ground. Some of them were dangerous. But they did good work. They did not know exactly where they were hitting, but they were going to learn to fly, and they did learn to fly, and they deserve an immense amount of credit, not only the officers themselves but the

people behind them, Admiral Fiske for one of them. I found they had about \$300,000 of the appropriation left, and I organized an aviation section in material with the best officers I had to work with, and we commenced to establish a policy and got it approved, and then we knew where we were going, and we developed as rapidly as we could.

When I took over the office there were a number of contracts but nobody was within six months—twelve months—two years—of their contract dates of delivery. They could not be. They did not know the game. Every fellow was making experiments; and we spent our money judiciously in encouraging even promising experiments, as I said the other day, and we gave every contractor who could build any type of machine that we had tested out or that was approved, a quantity order for training purposes. But they had not, at that time, gotten beyond the school planes, and our school planes were not the safest things that ever happened.

And of engines we had all types, from everywhere. We had contracts abroad that we could not get filled. They would not give them to us. We had contracts at home. We endeavored to buy the rights abroad. There were companies spending millions of dollars in development. The foundation of the Liberty motor was developed in the Packard works by Mr. Joy, the vice president. I would hate to guess at how much money he spent before the Liberty became an engine in the attempt to develop an American type from the Rolls-Royce type for quantity production. I have heard the amount estimated at \$2,000,000. That was pooled with all the others. The Hall-Scott was a good motor, the one that we used in our planes. But we did not have a motor that was satisfactory at all, and we did not have a motor at that time that could be produced in anything like war quantities. It simply did not exist.

In March, 1916, the aviation work was moved from the separate office on the first floor of the State, War, and Navy Building and was officially and physically incorporated in Material under the immediate supervision of Lieut. Bronson. He was killed in an explosion at Indianhead early in November, 1916, in an attempt to test an aerial bomb that the Bureau of Ordnance was trying to develop.

Lieut. J. H. Towers, who was the oldest flier we had, was assigned to the aviation desk.

In May, 1917, Commander Irwin was ordered to duty as my assistant in aviation, and in July I had gotten the organization and the plan and the policy shaped up enough so that at my request the Chief of Operations and the Secretary approved my divorcing Aviation from Material, and I said, "Thank God," and slept easier nights.

After that everything went along according to the plans, and it was well looked out for.

The CHAIRMAN. What was that date?

Admiral McKEAN. March 1, 1917. This condition continued until July, 1918, when it was separated and made a separate office.

The CHAIRMAN. And you had no more to do with it after that?

Admiral McKEAN. No, sir; not after that. It had then a very good set of officers. We had gotten the personnel in and it had gotten thoroughly organized, and there was fine cooperation between the bureaus and the aviation office direct, and they were getting results, and, like many other things, had the war lasted a little

longer the people would not have been so disappointed in our air results. We were going fine when it stopped.

The first of these papers which I submit is dated January 19, 1916, from the Director of Naval Aeronautics to the Chief of Naval Operations, it being the annual report on aeronautics. That was made by Capt., now Admiral, Bristol. It goes into the whole development of that time.

This memorandum as to the history of aviation and the annual report referred to are as follows:

B-2.

MEMORANDUM ON AVIATION.

(a) For three years prior to July, 1914, aviation was handled as a matter of experiment in the Bureau of Navigation, with small appropriations of approximately \$10,000 per annum.

(b) In July, 1914, the first step was taken for the establishing of the Office of Naval Aeronautics, which was a part of the Office of the Chief of Naval Operations, and was in charge of Capt. M. L. Bristol. This office continued until March 1, 1916. On February 25, 1916, orders were requested for Capt. Bristol, which detached him for duty with the fleet.

(c) In March, 1916, the aviation work was moved from its separate office on the first floor of the State, War, and Navy Building, and was officially and physically incorporated in Material, under the immediate supervision of Lieut. Bronson. Lieut. Bronson was killed in an explosion at Indianhead early in November, 1916, and Lieut. J. H. Towers was assigned to the aviation desk in Material. This organization was in force when diplomatic relations were severed with Germany early in 1917.

(d) In May, 1917, Commander N. E. Irwin was ordered to aviation duty in Material, and in July of the same year the aviation work was segregated and moved to the Navy Annex. This condition continued until March 7, 1918, when General Order No. 375 was signed by the Secretary of the Navy, creating the Office of the Director of Naval Aviation."

B-2-1.

JANUARY 19, 1916.

From: The Director of Naval Aeronautics.

To: The Chief of Naval Operations.

Subject: Annual Report on Aeronautics.

The developments in aeronautics at the present time may be summarized as follows: (1) The establishment of an air service in the Navy being developed by the efforts of all the bureaus of the department concerned and directed by the Office of Naval Operations.

(2) The establishment of an aeronautic station at Pensacola for the training of personnel for the air service and for all kinds of practical experiments to develop materials.

(3) The establishment of courses of instruction and training for officers and men to produce air officers to command and crews to man air craft.

(4) The establishment of a regular system of detail of officers and men for instruction and training.

(5) A system of model experiments in the "wind tunnel" and "model basin" at the Washington Navy Yard, coupled with practical experiments at the aeronautic station, Pensacola.

(6) A special testing plant at the Washington Navy Yard for research work to develop air-craft machinery.

(7) The cooperation of the United States Weather Bureau to obtain meteorological observations for special use of the air service.

(8) The authorization of the National Advisory Committee for Aeronautics was greatly due to the efforts of the Navy Department.

(9) The development of an inspection system has been well advanced for aeronautical materials supplies from private concerns.

(10) A campaign of education of private manufacturers of aircraft and aircraft materials to the requirements for naval use has been carried out pretty thoroughly.

(11) The administration of all affairs of the Air Service has been worked out on a sound basis and placed in the same category as all other services of the Navy.

A large number of experiments have been carried out and great progress made in the development of aeronautics for the Navy. These are summarized as follows:

(1) All kinds of flying under different weather conditions and sea conditions have been carried out to determine the best system of training of officers and men for the Air Service.

(2) A type of aeroplane for instructional purposes has been developed.

(3) To develop the question of the relative value of inherent stability in connection with the other requirements of an aeroplane.

(4) To determine the value of automatic stabilizers. In this connection, the Sperry gyroscopic stabilizer was investigated and tested.

(5) To determine the best type of floats for an aeroplane to operate on the open sea. The boat type, the single pontoon type, the twin pontoon type, and a triple pontoon type have been and are being tested.

(6) To determine the banking control of aeroplanes; ailerons and flaps being utilized and modified.

(7) To determine the best type of steering apparatus, the Curtiss type, two Wright types, the Farman type, the Deperdussin type, a modified Deperdussin type, and the Burgess-Dunne type being utilized.

(8) To determine the best aeroplane fabric, as regards strength and durability, utilizing different dopes and treatments.

(9) To determine a suitable motor to aircraft, three Curtiss types, two Wright types, one Renault type, one Sturtevant type, one Robert type, one gyro duplex nine-cylinder type, and one Hall-Scott type motors being tested.

(10) To determine propellers suitable for aircraft, various types of two, three, and four bladed propellers being tested.

(11) To determine the instruments and accessories for aircraft motors, various types of magnetos, carburetors, tachometers, gasoline and oil systems, oil gauges, gasoline feed pumps being utilized.

(12) To develop the radiating system for cooling the circulating water of aircraft motors, four types being considered.

(13) To develop the equipment of officers and men operating aircraft, clothing, goggles, helmets, gloves, life preservers, and safety belts with quick-releasing devices being considered.

(14) To develop equipment for navigating aircraft, altimeters, airspeed meters, compasses, inclinometers, sextants, navigating watches, binoculars, drift indicators, and chart boards are being utilized.

(15) To develop signaling apparatus specially adapted to aircraft, fireworks, smoke bombs, and radio being utilized.

(16) To develop repair and operating methods for active service of aircraft, which also includes quick assembling and disassembling, the proper alignment for flight, and the officers and crews required for aircraft.

(17) To develop a launching device for aeroplanes launched from ships under way at sea.

(18) To develop the operation of aeroplanes with the fleet in active service, the *North Carolina* being fitted with "launching device," special cranes for launching aeroplanes and storage arrangements for carrying aeroplanes which are being considered.

(19) To develop dirigible operations.

(20) To develop material for the construction of air craft and air craft accessories.

In order to proceed to the future development of an efficient Air Service of the Navy, the following activities should be recognized at once and pushed energetically, viz.

(1) A section under the Office of Naval Operations (Material) devoted to aeronautical work is required with officers to push the work.

(2) A section of the Air Service for the fleet is necessary.

(3) A section of the Air Service for coast defense is necessary.

(4) A section of the Air Service for Advanced Bases is necessary.

(5) The aeronautic station at Pensacola for the training of officers and men and all kinds of experimental work should be continued.

(6) A commanding officer of the Air Service to take charge of all activities of air craft and air craft stations should be detailed.

(7) The preparation of plans for coast defense by air craft with the immediate location of air craft stations at the most salient strategical points of our coasts is absolutely essential.

(8) All the bureaus having cognizance of aeronautical materials should consider the development of such materials of first importance, requiring special effort equal to the efforts, in all other directions if not more, considering the necessity for rapid development.

(9) Adequate appropriations for the Air Service are necessary the \$2,000,000 recommended to Congress to be appropriated for next year with \$1,000,000 for each year for four years thereafter is not adequate.

The next is dated February 25, 1916. That is when Capt. Bristol was relieved of aeronautics, and he was sent to sea on the *North Carolina* on account of his experience and his interest in aviation, to develop aviation on board ship by practical testing out, and he was to organize the scout division with the *North Carolina* as his flagship, and eventually three other ships, and we were going to have a division of scouts with aeroplane attachments complete, within a year from that time.

The paper last referred to is here printed in the record in full as follows:

B-2-2.

FEBRUARY 25, 1916.

From: Chief of Naval Operations.

To: Chief of Bureau of Navigation.

Subject: Orders for Capt. Mark L. Bristol.

Enclosures: 3 memoranda—Complement of *North Carolina*.

1. It is requested that orders be issued to Capt. Bristol detaching him from duty as Director of Naval Aeronautics, and ordering him to duty in command of the Air Service and in command of the *North Carolina* in connection therewith, also; that he be directed to assume supervision over all aircraft and aircraft stations and the further development of aeronautics in the Navy. Further that he be directed to report by letter to the Navy Department and to the commander in chief of the Atlantic Fleet upon taking command.

2. In order to place the *North Carolina* in commission for duty in experimenting with aircraft and operations of aircraft with the fleet, it is requested that an additional officer of suitable rank be detailed as executive officer. The other officers should be ordered to that ship from officers now attached to the aeronautic station, Pensacola, upon recommendations to be made later by Capt. Bristol.

3. It is requested that the complement of enlisted men required for the *North Carolina* be completed. There are inclosed three memorandums regarding enlisted complement of the *North Carolina*. The vacancies therein reported to make up a reduced complement is the very minimum that should be considered, and the full complement should be provided or as much thereof as possible.

4. It is desired to begin operations with the *North Carolina* as soon as possible, and at least that she arrive at Guantanamo by the 26th proximo, when target practice of the Atlantic Fleet begins. It is requested that Capt. Bristol's orders be issued on 4th proximo.

The next is a memorandum dated February 26, 1916, which shows the personnel required for the aircraft then on hand and ordered that Lieut. Bronson estimated for me at the time I took it over, as necessary for the aircraft then on hand and ordered. This memorandum is as follows:

B-2-3.

MEMORANDUM.

FEBRUARY 26, 1916.

For: Capt. J. S. McKean, U. S. Navy.

Subject: Personnel required for aircraft now on hand and ordered.

One captain, Division of Material; 1 lieutenant commander, assistant; 1 captain or commander in command of aeronautic station, Pensacola; 2 lieutenant commanders, as assistants; 4 lieutenants, as instructors.

For 1 dirigible: 1 lieutenant commander, 1 lieutenant, 4 enlisted men.

For 16 aeroplanes, on hand: 16 lieutenants (junior grade), 64 enlisted men, and 16 lieutenants.

For 29 aeroplanes ordered: 29 lieutenants (junior grade), 116 enlisted men, and 29 lieutenants.

For 1 spherical balloon: 2 lieutenants.

For 1 kite balloon, ordered: 2 lieutenants.

In all: 2 captains, or 1 captain and 1 commander; 4 lieutenant commanders; 54 lieutenants; 45 lieutenants (junior grade); 184 enlisted men.

Here is a statement of appropriations, dated February 29, 1916. I wanted to know how I stood on the appropriations before I started plunging on the air business.

(The statement is as follows:)

B-2-4.

Navy Department, Bureau of Supplies and Accounts—Aeronautics, Navy, 1916.

	Available balance.	Obligations outstanding	Unexpended balance.	Amount expended.	Total of allotment.
1. Airship shed.....		\$55,800.00	\$55,800.00	\$34,200.00	\$90,000.00
2. Wrecking derrick.....	\$23,589.45		23,589.45	11,226.55	34,816.00
3. Hydrogen plant.....	1,049.38	6,026.20	7,075.58	17,924.42	25,000.00
4. Maintenance, aeronautic station.....	4,302.95	5,133.16	830.21	24,169.79	25,000.00
5. Set aero hangars.....	46,989.95	51,678.00	98,667.95	11,332.05	110,000.00
6. Repairing seamen's quarters.....	31.01		31.01	4,568.99	4,600.00

12. Cost of air craft.....	60,321.75	362,397.30	422,719.05	45,928.85	468,647.90
30. Experiments, aero station.....	11,267.67		11,267.67	3,732.33	15,000.00
31. Experiments, miscellaneous.....	12,456.53		12,456.53	2,543.47	15,000.00
32. Cost of buildings, aircraft stations ¹					
Undistributed balance.....	65,586.10		65,586.10		65,586.10
Total.....	296,143.01	483,305.66	779,448.67	220,551.33	1,000,000.00

¹ No allotment.

The next is an indorsement dated March 21, 1916, relative to appropriations for aeronautics and proposed naval aviation corps, proposed by the General Board to the Secretary of the Navy. The General Board recommended \$5,000,000. The department recommended \$2,000,000. We got \$3,500,000. This indorsement reads as follows:

B-2-5.

[Second indorsement, G. B. No. 449. (Serial No. 504) Mar. 21, 1916. E. L. B.]

From: President General Board.

To: Secretary of the Navy.

Subject: Relative to appropriation for aeronautics and proposed Naval Aviation Corps. Returned.

2. The General Board recommended an appropriation of \$5,000,000 for aeronautics for the fiscal year 1917, because—

First, the existence of a large fund available until expended as circumstances warrant would do much to encourage invention and the development of naval aeronautics.

Second, it believed that as soon as the experimental development of engines and planes should reach a certain stage of efficiency a large portion of this amount could be expended to advantage immediately in equipping the ships of the Navy, advanced bases, etc., with a proper number of aeroplanes.

Third, that the development of the dirigibles may scarcely be said to have begun, and it was anticipated that representatives of this type would be ordered for trial during the coming year at a considerable expense. Should the trial work take more time than was hoped by the board, nevertheless the unexpended balance of the appropriation would remain available.

3. The General Board believes that \$2,000,000 for the next fiscal year is not an adequate sum for the development of aeronautics. In November last the General Board recommended \$3,000,000 for the current year to maintain the station and experimental work and one million for each of the succeeding four years. It regarded its own estimate as small at the time, but was anxious to place as much as possible of the \$5,000,000 sum upon approved types. The General Board now believes in the light of further evidence from abroad that \$3,000,000 per annum will be none too much for current expenditure upon aeronautics and that next year it may have cause to recommend still higher expenditures in this direction.

Here is a letter I referred to, to get the basic program from the General Board, summing up my numerous queries. This is to the General Board from the Secretary of the Navy. [Reading:]

B-2-6.

NAVY DEPARTMENT,
Washington, April 12, 1916.

To: General Board.
Subject: Aeronautics.

1. To enable the department to undertake the orderly and systematic development of aeronautics in the Navy the General Board is directed to make a study of the possible naval uses of aircraft, recommend the most desirable types of such craft, recommend the general requirements for each type, and to outline their military functions and characteristics.

That is along the lines of the duties of the General Board with reference to the characteristics of ships. Here I wish to say that the policy recommended by me and adopted by the department was that aircraft was simply another type of naval craft. If we needed them at all, we needed them to make up a part of a team, the same as we needed the destroyers or scouts or cruisers or battleships; or, if they were such a peculiar animal that they could not take their place in the fleet as a ship, and be associated with the rest of the unit and as a part of the team, they did not belong in the Navy; they were foreign matter. And in that connection the organization that we operate we assign the parts, just the same as we do with the ship. The hull goes to Construction and Repair; the machinery goes to Steam Engineering, to the machinery bureau; navigation instruments are provided by the Bureau of Navigation; and all the way through it is handled exactly like any other naval craft; and I believe that that should so continue, and that this proposition of an aviation bureau separate and distinct will lead to a separation, excess overhead charges, and inefficiency, and it will demoralize it. If it is such a peculiar breed of animal that it has to have special provisions made of it, it does not belong in the Navy. If we can not use it as we do other craft, as a part of the fleet team, then it is not our job; and I believe thoroughly that it is our job, and I believe there is a big future for it. But do not let us get a little air navy separate from the rest of the Navy, or it will not hook up with the fleet. It will always be a star player, but it will not work in with the rest of it.

The CHAIRMAN. You believe in some kind of cooperation between the Army and Navy in the matter of construction?

Admiral McKEAN. Oh, yes, sir; we provided for that. [Continuing reading:]

2. The General Board will also give its opinion of the relative importance of the various types, recommend the relative numbers, and the order in which the types should be developed to meet our strategical and tactical demands.

3. As early a reply as practicable is requested, in order that the program for the coming year's developments may be laid out.

JOSEPHUS DANIELS.

The next is a memorandum dated May 15, 1916. This was a memorandum from Lieut. Bronson. He was giving me the status as of that date, May 15, 1916, of all parts of it, and to show the stage of development we had reached, where we were going to start from to go on. This memorandum follows:

B-2-7.

MAY 15, 1916.

Memorandum for: Capt. J. S. McKean, United States Navy.
Subject: Aeronautics.

1. The flying school has now been fully established at the Pensacola Aeronautic Station and officers and enlisted men of the Navy are being trained as rapidly as possible consistent with the facilities of the Navy Air Service. Also, the officers of the Coast Guard Service are now undergoing a course of instruction at this school, and one officer of the Naval Militia has received a short course of instruction.

2. The aircraft repair facilities at this station are being developed; and it is hoped that in another three months the station will be in a position to undertake the construction of one or more aeroplanes.

3. Effort has been and is being made constantly to search out and test the various types of aeroplanes with the view of finding one or more types that are suitable for service conditions. The delay in the manufacture of these aircraft has been very detrimental to the service. Of all those aircraft contracted for during the present fiscal year, not one has been delivered less than 60 days overdue on the contract time, except a few that were ordered according to old plans.

4. A small nonrigid dirigible is nearing completion and it is hoped will soon be ready for preliminary trials. The company manufacturing this dirigible has shown great reluctance in conducting certain obviously necessary trials of the machinery. The company manufacturing the floating hangar for this dirigible is long overdue on delivery, but it is expected that delivery will be made in the very near future.

5. The Bureau of Construction and Repair has designed and is constructing at the Washington Navy Yard, a large twin engine aeroplane. It is hoped that this machine will prove to be fit to go to sea.

6. Various motors have been contracted for and tested at the Aero Motor Testing Laboratory recently completed at the Washington yard. Of four motors recently tested, three failed to meet the requirements of the service and have been rejected. In order to be able to go to sea with reasonable safety in an aeroplane, it is absolutely essential that reliable motors be available. No such motor is now on the market in this country, and so far as is known, none in other countries. It is believed, however, that the solution of this problem is in sight. Until recently few real gas engine designs has gone in for the development of aeronautic motors. The automobile field was sufficient to keep them busy. Recently, however, a number of men prominent in the development of automobile and motor boat engines have gone in for aeroplane engine designing and manufacture.

7. Next after the motor question, the most difficult problem that the Navy Air Service is confronted with is the development of a seagoing pontoon for aeroplanes. Trials of the various types turned out by the different manufacturers indicate more and more that the solution of this problem will come only from the Navy Department. The Bureau of Construction and Repair has already developed several types of floats, two of which have proved superior to any type of float tried out by the Navy Department, manufactured by any private corporation or individual. It is hoped that the type of pontoon that will soon be tried out on the large aeroplane nearing completion at the Washington yard will prove to be a seagoing pontoon.

8. The kite balloon was received too late to be taken on the *North Carolina* for tryout as a spotting station. This, however, will unquestionably be tried out at the next target practice.

9. Nothing has been done relative to dirigible design because of the lack of personnel available to devote their time to the study of this, in itself, separate and distinct subject.

10. A launching device structure for the *North Carolina* has been designed and manufactured and is now being set up on the *North Carolina* at the Pensacola Aeronautic Station. Plans have been developed and construction is now under way on launching device power units capable of handling larger and heavier aeroplanes. Plans for the track structure for these larger units are being developed at the Puget Sound and Portsmouth Navy Yards, where preliminary work relative to the installation of these launching devices on the *West Virginia* and *Washington* is under way.

BRONSON.

The next is from the Chief of Naval Operations to the Secretary of the Navy, dated May 25, 1916. [Reading:]

B-2-8.

MAY 25, 1916.

From: Chief of Naval Operations.

To: The Secretary of the Navy.

Subject: Change of orders of the commander of the Air Service and the *North Carolina*.

1. In view of the approaching departure of the *North Carolina* from Pensacola, equipped for service with the fleet, and the impracticability of an officer at sea successfully directing both sea and shore activities, it is recommended that orders be issued to Capt. Mark L. Bristol, United States Navy, relieving him of the responsibility of the "supervision over all aircraft and aircraft stations, and the further development of aeronautics in the Navy," and that new orders be issued to him as commanding officer of the *North Carolina* and supervision of the development of aircraft and aircraft service with the fleet, to take effect June 1.

2. It is the department's policy to equip with aircraft the vessels that would be used as scouts as rapidly as possible, and it is expected that this will develop into a scouting division of the fleet equipped with aircraft.

3. The duties of the commander of the *North Carolina*, in addition to the command of the ship, would comprehend the following:

(a) Coordinate the use of aircraft with the fleet.
(b) Assist in the development of aircraft by constructively criticizing all types issued to the service, with recommendations as to changes of design, etc., to prepare and fit them for the service, make reports of operations, etc., to the bureaus concerned via the office of the Chief of Naval Operations.

(c) Originate suggestions for experiments, modifications in design of machinery, hulls, navigational instruments, etc., communicating the same to the bureaus concerned via the office of the Chief of Naval Operations.

(d) Submit to the Chief of Naval Operations recommendations relative to the types of aircraft best suited to meet the requirements of the fleet.

(e) Make reports on the adequacy of the training of the officers and men sent to the ships from the aeronautic station.

W. S. BENSON.

This separates the shore from the sea and gives Capt. Bristol his separate mission to coordinate the aeronautics with the fleet.

We were trying to establish the air service with the fleet, and to keep theory pure and simple from controlling the theoretical construction, we were getting back from the fleet, from the practical man, criticism, suggestions, and recommendations he had gotten from the use that we wanted to put these crafts to; and I think that shows the constructive lines along which we were trying to work.

The next is a report on the development of aeronautics dated June 24, 1916. This in answer to the request of the Secretary that the General Board prepare a report on the development of aeronautics, etc. It goes on and very fully and completely discusses the kind of craft we needed, how many, where they would be used and how they would be used, and so on; and I as stated before, it gave us a policy and plan along which to work to systematize our aeronautical efforts. The eighth paragraph of this report was as follows:

From the experience of the war, it seems that aircraft are used for the following naval purposes:

Reconnaissance.

Patrolling in advance of the fleet.

Fleet and ship fire control.

Fighting other aircraft.

Attacking other submarines.

Attacking surface craft.

Coast patrol.

Raids upon hostile coasts.

Then they considered the relative suitability of the different types of air planes to dirigibles. They go into great details even as to different types and weights of machines. They had all the information and they had all the foreigners and all that our people had before them, and it was the first complete study made—well, not the first. There was one before. But this is the most complete study up to date of the naval uses practicable for aircraft or desirable.

DEVELOPMENT OF AERONAUTICS.

JUNE 24, 1916.

From: Senior member present.

To: Secretary of the Navy.

Subject: Development of aeronautics; military functions and characteristics of aircraft.

Reference: Department's letter No. 26983-638 Mat., of April 13, 1916.

The development of aeronautics in the United States Navy has hitherto been confined to the development of material and the technique of flying. Study of the proper strategic and tactical employment of the aeronautic arm of the Navy has been given little attention. Abroad, the war has developed aeronautics very greatly and very rapidly both in technique and in tactics and strategy. We are, therefore, obliged for the present to follow the lessons of the war. But in applying these lessons we must not neglect to make due allowance for the special conditions which on one side apply to the present war and on the other side apply to the special situation of the United States in any probable war.

2. In analyzing the qualities of aerial craft and in comparing them with those of surface and submarine craft it is at once apparent that aircraft differ from surface craft by the capability of moving at speeds very much higher than can be reached on the surface of the water. On the other hand aircraft can transport only very small loads compared with those of surface craft. At the present day, warfare in general is marked by the expenditure of great mechanical power in destructive effort. War is an affair of great masses, both of personnel and of material. Although the aeronautic arms need a considerable personnel in the aggregate, yet each unit can deal only with comparatively small weights, in the way of motor power and armament. It follows that aeronautics does not offer a prospect of becoming the principal means of exercising compelling force against the enemy.

3. The characteristics of the aerial military service in which it is superior to surface forces ashore and afloat are its high speed and its power of withdrawing vertically from surface observation and surface attack. The great speed of the aeronautic service indicates the chief line of its employment, namely in the obtainment of information. The principal roles of the air service appear to be found in the various forms of reconnaissance including strategic scouting, in tactical patrol and picketing and in spotting and other methods of fire control.

4. In the execution of these various activities it may be necessary to overcome resistance of hostile aircrafts. Although battle is a secondary function of naval aircraft, nevertheless, they should have some fighting capacity, and at times some of them must be devoted to combatant support of the reconnoitering force. Further, if the enemy is not completely master of the air it will frequently be possible for aircraft to utilize their very moderate lifting and transporting capacity by dropping explosives without prohibitive danger of counter attack from the surface.

5. In accordance with the above considerations, the war has developed aircraft in three chief types, the first where some form of scouting has been the objective, the second where combatant ability in support of the reconnaissance service has been the primary feature and the third where freight capacity for carrying explosives has been prominently developed. Each of these principal types has had various subdivisions and modifications as the result of varying conditions and growing experience, but the classification seems a fundamental one.

6. In carrying further our examination of the types of aircraft suitable for the naval service we must now take note of the two types of aircraft; those heavier than air and those lighter than air and consider their special characteristics. Both are developing rapidly, but there are differences in the capabilities of the two types which those best qualified to judge regard as essential and permanent.

7. The heavier-than-air machine, the aeroplane, has inherent possibilities of superior speed but can not carry equal weights. The lighter-than-air machine, the dirigible, can not be driven as fast as the fastest aeroplanes, but its greater lifting power may be utilized to give it either greater radius of action, greater armament or greater freight

capacity for bomb carrying or other purposes. Further, it can remain at rest on station. The lighter-than-air machines have the advantage that changes of altitude consume their stores of gas and ballast, so that they thus lose maneuvering power if forced to several marked changes of altitude in opposite directions. With the large size of the lighter-than-air machines are the attendant disadvantages of great cost and size of target and difficulties in housing, launching and landing from flight.

8. From the experience of the war, it seems that aircraft are used for the following naval purposes:

Reconnaissance.

Patrolling in advance of the fleet.¹

Fleet and ship fire control.

Fighting other aircraft.

Attacking other submarines.

Attacking surface craft.

Coast patrol.

Raids upon hostile coasts.

9. We must here consider the relative suitability of the different types of aeroplanes and dirigibles. Where great speed is the principal desideratum, aeroplanes are the choice. Where combatant strength and carrying power and endurance in the air are more important the dirigible is preferable, but its advantages are modified by size and difficulty in launching. The merits of the dirigible have been somewhat overlooked in this country because the comparative cheapness of the aeroplane has given it vogue as an instrument of sport and it has been forced ahead by manufacturers seeking profit and by sportsmen, whereas the dirigible having no advertising claque has been comparatively undeveloped. The war, however, has forced the belligerent nations to develop all sizes of dirigibles for various services. As this country has as yet done nothing to develop dirigibles, the necessary steps at present are experimental ones only.

10. The Navy should build experimental dirigibles of the various types and train a personnel, and after three or four years of trial and error it will then be possible to see what such craft can do tactically and strategically and along what lines they should be developed for service. The General Board can not too strongly urge the necessity of conducting very extended experiments with dirigibles now. In so doing the General Board recognizes the possibility that it may turn out that the condition and geography of the United States are such that dirigibles will be of little value to the United States Navy. Nevertheless, the contingency must be accepted, for the chance of success is well worth the expenditure, and the results possible merit thorough investigation. The General Board recommends the immediate construction of three small nonrigid dirigibles of between 1,600 m³ and 2,000 m³ displacement. These sizes are accepted standards abroad for short-distance patrol work.

The General Board also recommends one rigid dirigible of about 11,000 m³ and one semirigid dirigible 11,000 m³. This is about the size of the early Zeppelins. The experience gained by American aeronautics and manufacturers will then be applied to advantage in designing dirigibles suitable for naval service. In this connection, the General Board desires to point out that not only are manufacturers in this country ignorant of approved methods of the construction of dirigibles but they have little working knowledge of the basis of airship construction and use. These elements of airship construction may be classed broadly under four heads; namely, motors fabrics, hull framework, and production of gas. It seems to the General Board that it would save time and expense to initiate experimental work separately on each of the three latter branches. Experiment should determine the best way of producing hydrogen on a large scale. Similarly, experiments with gas-tight fabrics do not need large balloons to carry out; the development of such material may be done without reference to great dirigibles. As to the hull framework, this is built up of very light girders combined to form the complete frame. Experiments should be carried out to determine the best way of building up these individual girders and of attaching them to each other. Only in regard to motors is progress evident.

11. Owing to the great technical lead which aeroplane service holds over dirigible service in this country, the Navy is much more ready to indicate its lines of development for immediate use. The manufacturing and designing skill of the country can turn out aeroplanes such as are desired. The reliability of the engines, however, is unfortunately not yet satisfactorily assured. As a basis for discussion we may take the three types of naval hydro-aeroplanes which have developed during the war.

¹ Fleet attack on Lowestoft at end of April, 1916, was preceded by Zeppelins.

We may also consider four chief Army types, namely, bomb-dropping, spotting, battle, and reconnaissance machines.

12. In deciding upon our aeroplane service we must first see what aeroplanes can do and then decide how we shall render profitable such services as they can offer with reference to the geographic and strategic situation of the United States. The size, speed, endurance, and load of aircraft are all interrelated and can be modified within limits. Hydroaeroplanes to be carried on board ships are limited in size by requirements of launching and recovery. A 4,000-pound machine of 57 feet span is about as large as we can contemplate for ship's use at present. From a machine of 4,000 pounds total weight we may expect to get from it, according to its design, a moderate speed of 70 miles and about 11 hours endurance, or a faster machine of 80 miles with 7 hours fuel endurance, both types to carry a crew of two, with wireless, etc.

13. The primary work of the hydroaeroplane is for reconnaissance, either long distance strategic work, or short distance tactical work, and for spotting and fire control. During the current war armies have found the aeroplane service indispensable. Navies have as yet obtained smaller returns from their aeroplanes in strictly naval employment. The comparatively small returns from naval air service seem due rather to the inherent differences of land warfare and sea warfare than to lack of energy in developing the naval aeroplane service.

14. Comparing strategic scouting on shore and strategic scouting at sea it will readily be perceived that the capabilities of the aeroplane are much greater on shore. This is owing to three things. First, it is easier to get off the land and to alight in bad weather than it is to get off the water and alight, because in bad weather the sea is affected and adds to the aviator's difficulty. Second, a plane making an overland trip has land marks both ways, and can land anywhere behind its own lines, whereas at sea the plane is without land marks, yet must return to its mother ship which must stop to pick it up and may find such a stop very embarrassing. Third, in land warfare the movement of an army is very slow. An army moves 12 or 15 miles a day; a forced march may be 25 miles. A fast aeroplane moves 80 to 100 miles an hour. Consequently, a reconnoitering aeroplane in a 3-hour nonstop flight can search out a belt of territory which can not possibly be crossed by army in less than 5 days. The high speed aeroplane of 4 or 5 hours endurance is therefore capable of giving most valuable strategic information some days ahead of hostile contact of the armies. Upon the sea, however, where fleets may move as much as 20 miles an hour, and usually will move at not less than 15 miles, the value of strategic scouting by aeroplanes is necessarily less than on land. Let us suppose that a fleet is advancing and endeavoring to keep a scouting line of aeroplanes as far ahead of it as possible. Let us consider that the fleet has available three types of 4,000 pounds aeroplanes whose speed and endurance are respectively 90 miles (statute) per hour 2½ hours, 75 miles per hour, 10 hours; 60 miles per hour, 20 hours. Machines of type number one are sent up at a given hour, advance 115 sea miles and return 78 miles, meet the force which sent them out and report all clear.

If this main body continues to advance, it may meet an enemy also advancing any time after about two hours. Evidently, the aeroplanes returning at sundown can not have searched out the whole night zone. Doing the same with aeroplanes of No. 2 type, 75 statute miles, 10 hours, they will advance 400 sea miles, and return 250 miles and if they meet their main body at sunset, they will also have failed to give assurance of a clear night zone. Finally if machines of the third type, of 60 statute miles (52 sea miles), are sent out they will advance 670 sea miles and return 370 miles. If they meet their main body at sunset the next day they will give assurance of a clear (12-hour) night zone provided the rate of approach of the two hostile forces does not exceed 31 knots. At this low maximum speed of flight (60 statute miles) the aeroplane has no great superiority of speed above that of ordinary winds. Its full speed is also its economical speed. A 60-mile aeroplane therefore seems to have as low a speed as is permissible for strategic scouting. This speed gives the maximum radius, which latter is scarcely enough to maintain a scouting line at an adequate distance in front of the main body. The conclusion to be drawn is that with aeroplanes of a size convenient for ship's use, a fleet can not maintain a serviceable scouting line by hydro-aeroplanes sent out from the main body of the fleet. Strategic scouting is primarily an affair of scout ships. However, if the aeroplane can not be relied upon to maintain an advanced scouting line thrown out from the main body, it may perhaps be an important assistance to ships which themselves are maintaining a scouting line.

The first thing to consider is how far an aeroplane can see. We know from Table 6 of Bowditch that on clear days the distance of the visible horizon is proportional to the square root of the height of the observer. But there is always more or less absorption of light in the passage of the visual ray through the atmosphere, and even on bright,

sunshiny days, this absorption frequently obscures objects well within the horizon of an observer on a ship's bridge. This absorption of light in the atmosphere is according to the general exponential equation yc^{x-1} where x is the distance from the object y is the amount of light which gets through to the point x (being unity at unit distance) and c is a fractional constant depending on the state of the atmosphere. It is evident that this rule for the absorption of light will operate very strongly to cut down the range of visibility from aircraft in case the air is not of the clearest. Let us consider a bright, fine day such as are common on the Atlantic coast of the United States when a ship can not be seen beyond 10,000 yards. On such a day an aeroplane gradually rising above the ship sending it up will not extend its circle of visibility as it increases its height until it rises into a clearer stratum of air. If upon reaching a given height, h , it passes up into a perfectly clear stratum, the radius, of its circle of visibility thereafter will begin to increase in the same ratio as it increases its height above the sea level. Putting the idea into an equation (neglecting small effects of refraction), if h is the height of the lower stratum, and d is the distance to which the vision will penetrate through the lower stratum, then when the aeroplane has attained the height x the range r of visibility will be $r = \frac{dx}{h}$. If h is 500 feet and d is 10,000 yard then 2,000 feet height will give a range of visibility of only 20 sea miles, whereas in clear weather it would be 51 miles. If h is 1,000 feet and d 10,000 yards then the range of visibility for 2,000 feet height will be only 10 miles.

Moreover, it is the testimony of flyers that when rising above the hazy stratum into clear air the upper surface of the haze may act as a reflector, so as to prevent penetration of vision below the haze unless the direction of vision is considerably inclined to the surface. It seems, then, that aircraft frequently will not be able to command great areas of visibility merely by rising to great altitudes. When the atmosphere is not extremely clear the aeroplane will preferably aid the scouting ship it accompanies by using its speed to range from side to side of its parent ship as a dog runs by the side of its master.

15. The various methods of scouting applicable to this situation are laid down in the works on the subject. The effect of using aeroplanes on the scouting line when conditions are favorable will be to increase the permissible distance between ships maintaining the scouting line. Thus if it is necessary to keep scouts at a distance not greater than a miles to prevent unobserved passage by the enemy, then with aeroplanes each covering the front of its own parent ship it may be possible to maintain them apart at an increased distance na . Under favorable conditions n might be as much as 3.

16. It thus appears that aeroplanes may be used in strategic scouting to aid and assist the ships which form the basis of the scouting force and the main reliance of the commander in chief. For this purpose it would be objectionable to employ aeroplanes of the highest speed and low endurance, as such machines would too often check the movement of the scouting line for resupplies. Too much endurance at the expense of speed is also objectionable. Scouting is not efficient at night; therefore an endurance for all-day flight is enough. This will give a maximum speed of 70 or 75 miles per hour.

17. The next point to consider is tactical or short-range scouting, including spotting and fire control.

18. An aircraft sent aloft for spotting has two advantages over spotting directly from the firing ship. The parallactic angle due to elevation enables more certain observations to be made as to range, and if the range approaches the limits of clear vision for the day, the spotting aeroplane can approach the enemy, thus increasing distinctness of vision.

19. On the other hand, the transfer of the spotter to a point outside the ship introduces administrative difficulties in the chain of command between the spotters and the gun which in some conditions may go far to neutralize the direct advantage of spotting from the aeroplane. Apparently this difficulty was far from negligible last winter in attempting fire control by flyers in experimental practice in the Atlantic Fleet.

20. When we pass from single ships to the control of division of squadron firing the difficulties of spotting from the air will be much increased, owing to the confusion in identifying salvos and in getting communication through. Nevertheless, it is very possible that aircraft may aid in spotting. Even when not doing much in this direction, fliers will be able to detect changes of the enemy's course, the appearance of submarines, the charge of torpedo boats, the moment of launching hostile torpedoes, etc., better than ships on the surface can do when engaged in battle. Aeroplanes can also do general short-range scouting for a distance of 20 to 30 miles from the force they attend.

21. For all these duties, the endurance should be measured by the period of day-light. An areoplane sent up either to spot or to watch for submarines should not embarrass and delay her mother ship by coming down at frequent intervals for re-supply. Neither must she sacrifice speed unduly. She must be much faster than ordinary winds. She can do little or nothing effective at night. She must be readily handled on board ship.

22. These considerations bring us to the conclusion that the characteristics of the hydroaeroplane for tactical scouting, spotting, etc., should be the same as for strategic scouting, namely, 4,000 pounds full load, 75 statute miles speed, endurance 10 hours at full speed and over 12 hours at economical speeds of 60 miles.

23. We must now pass to the examination of the practical limitations which will be placed upon the theoretic possibilities of aeroplane service as outlined above.

24. For our present needs in the Navy we may omit the heavy-weight carrying type for bomb dropping, since inaccuracy in aiming forbids it to render valuable service against anything but large land targets. When bomb dropping becomes sufficiently accurate for naval use it will be best executed from dirigibles whose size will permit them to carry a large supply of bombs. Combat hydroaeroplanes for use with the fleet and using the fleet as their base do not seem necessary at present.

25. The Navy must not be rendered too sanguine by the accomplishments of the aeronautic arm of the Army. Aeronautics is undeniably dangerous, and no risk should be run for which the return is inadequate. The risks of aerial battle will always be encountered with alacrity if the material equipment is substantially equal to that of the enemy, but aside from the dangers of hostile encounter the navigational risks of aeronautics at sea are far greater than those on shore.

26. An aeroplane putting off from a ship at sea and losing sight of her may readily be lost, whereas an aeroplane leaving a given station can land anywhere and get information; or if in hostile territory, a long continued flight in the proper direction must bring one to friends. Over the land, an aeroplane forced to alight can usually do so, and is safe, whereas a hydroaeroplane forced to alight on the sea may be helpless and sacrifice the lives of all concerned.

27. The responsibility resting upon those requiring service of hydroaeroplanes in war is therefore much greater than upon those controlling the land service. Moreover, a few errors in judgment on the part of commanding officers and consequent unnecessary sacrifice of aviators will affect the morale of the aviation service in general, and go far to destroy its usefulness.

28. For all these reasons, it seems that the Aviation Service, as attached to the fleet, will not be of as great importance to the Navy as its Aviation Service is to the Army. There is no substantial reason apparent at the present time to yield to the clamor of the extremists who assert the supremacy of aeronautics as a naval arm. On the contrary, the Aviation Service with the fleet seems likely to be confined to a subordinate rôle.

29. Aviation, however, is developing in its technique and must not be overlooked or neglected while in its present stage. It seems that aviation afloat will be developed on a scale amply sufficient for the present and for the next two or three years if the department forms a standard ship division of two machines, two commissioned officers, and four petty officers (all trained as pilots and observers) and four seamen.

30. All battleships of *Delaware* and later classes may have one of these divisions, and scout ships should have two of these divisions. In its general maintenance such a ship's aviation division will depend upon the resources and support of the ships, as is the case with any other ship's division.

31. It yet remains to mention the possibilities of kite balloons and their desirability for naval use. Kite balloons are captive, small in size, without motive power, and are so shaped, with such appendages, that the pressure of the wind acting against the anchor rope is unable to beat them down to the ground. Their displacement is about 800 m³. They carry two observers and usually do not ascend above about 500 feet. They are used for fire control and for spotting. They can not be used from combatant ships, as their presence would be very impracticable. For naval use they would need special carrier ships, and under suitable conditions they might prove serviceable, and so the British fleet found them at the Dardanelles for bombarding the Turkish positions. For use with the fleet in strictly naval actions it is not probable that they would prove valuable. Nevertheless, the General Board recommends that the Navy procure one and ascertain its value to the Navy.

32. For aeroplanes working as coastal patrols the situation is very different from that confronting ship aeroplanes. Considering the aeroplane as an element in the coastal system of security and information, we must first view this service as a whole and decide what is to be expected of it and then see what part the Aviation Service is able to play in the execution of the general plan.

33. The coastal patrol service has three duties it may be called upon to perform:
 (a) To watch for the enemy's appearance on the coast and note the activities in which he engages.

(b) To keep open a line of communication along the coast free from enemy's mines, etc.

(c) To maintain the enemy's auxiliary craft (both surface and submarine) at a distance from the principal ports so that naval and merchant shipping may get sea room and maneuvering position before encountering the enemy.

34. This coastal service will be local in its nature; its organization and administration will be regional, based on the naval districts. The shipping will consist of yachts, torpedo boats, and such other fast small craft as can be obtained to act as patrols, mine layers to protect harbors and roadsteads, tugs and trawlers to sweep for hostile mines, coast submarines to attack the enemy.

35. To aid all these craft in getting information, an air service will be of value. As has already been stated, the United States has not yet developed dirigibles to a serviceable stage. For some years our coastal air service must consist of hydro-aeroplanes only.

36. They should be able to carry two observers, a gun and a wireless outfit.

37. In coastal patrol, a strategic limit is set by the night zones which it is possible for the enemy to traverse under cover of darkness and appear at daylight. For the very fastest craft this may be as much as 400 miles, but for a large mixed force we may take it as not in excess of about 200 miles. Our outer line of patrol ships will be maintained at this distance from the principal ports. The aeroplanes should be able to supplement their patrol (weather permitting) by the rapidity of their flight along this boundary line. If we assume that they make their trip at reduced power unless an emergency is encountered and they stay on station half a day, they will need about 12 hours endurance at 60 miles an hour plus some reserve fuel to push back against an unfavorable breeze should such occur.

38. The speed of such craft should be 80 miles per hour. This is not extreme, but is greater than is likely to be found in hostile ships' aeroplanes.

39. Such a machine will weigh about 7,500 pounds, will have a radius of about 800 miles at full speed and of about 925 miles at 60 miles speed. It will carry a crew of two men, a machine gun and wireless, and a small available carrying capacity in addition. A 10,000-pound machine of same speed, crew, and outfit could do nearly 900 miles at 80 miles per hour or nearly 1,150 miles at 60 miles speed.

40. To patrol the immediate neighborhood of the coast and act as lookout for the mine sweepers and other inshore patrols the endurance may be much less, as the craft would only go 20 or 25 miles offshore to be on station. Two hours run at full and six hours at half power would be sufficient endurance. As these craft would be auxiliaries to the patrol boats and would never be far from them, they could depend on their support if attacked by hostile aeroplanes. A moderate speed of 75 statute miles would be enough for these conditions.

41. Such a craft would resemble in characteristics the 4,000-pound type for ship use already discussed. As her radius would be less, the saving in full load weight might be utilized to carry small bombs to attack submarines.

42. The General Board recommends that the standard hydroaeroplane division for coastal patrol consist for the present of three 7,500-pound machines and four 4,000-pound machines with a personnel of each division consisting of 8 commissioned officers and 8 petty officers as fliers and the necessary machinists and other enlisted men as mechanics and helpers. Reserves of machines should be established as types are perfected. For the present one of these hydroaeroplane divisions should be located in each naval district (except those on the Great Lakes) and in the Canal Zone. Pensacola will be the school station as at present.

43. The General Board recommends that the aeronautic training station should be directed to train aviators to its capacity. The General Board can not too strongly urge the great desirability of relying solely upon officers and men trained in the Navy and fully acquainted with the peculiarities of naval duties in general as the material from which to develop naval fliers. Dependence upon cross country fliers for sudden transformation into spotters and professional observers for naval work will, in the opinion of the General Board, result in absolute inefficiency.

44. In conclusion, the board summarizes its recommendations as follows:

Dirigibles.—(a) Experimental development of essential parts of dirigibles—motors, hull frame work, gas-tight fabrics, and gas production.

(b) Construction as early as possible of one small rigid dirigible, one small semirigid dirigible, and three nonrigid dirigibles.

Hydro-aeroplanes.—(c) Adoption of 4,000-pound 75-mile hydro-aeroplane to carry two in crew with machine gun and wireless for ship use and short-range coastal work.

(d) Adoption of 7,500-pound 80-mile hydro-aeroplane to carry two in crew, with machine gun and wireless for long-range coastal patrol work.

(e) To establish ship divisions of hydro-aeroplanes for service on board battleships of Delaware class and later, and on board ships of scouting force.

(f) To establish one coast patrol division of hydro-aeroplanes in each naval district (except those on Great Lakes) and in Canal Zone, to be increased later as may prove advisable.

Kite balloons.—(g) To build one kite balloon for trial.

Previous recommendation.—(h) The General Board reaffirms the statements made in its second indorsement (G. B. No. 499, Serial No. 504) of March 21, 1916, which indorsement should be read in connection with this letter.

CHARLES J. BADGER.

Next is to the Secretary of the Navy from the general board, dated November 15, 1916, on the subject of the number of aircraft for our service. They debate there the number necessary for the present fleet, for future ships, for land service and coastal patrol, experimental, school, machines and reserves, summary and estimated requirements. They give the estimated numbers in each case. This memorandum is as follows:

B-2-10.

GENERAL BOARD,

Washington, November 15, 1916.

G. B. No. 449.

(Serial No. 589-t.)

To: Secretary of the Navy.

Subject: Report in accordance with paragraph 3 of department's letter No. 3238-1 of August 8, 1916, number of aircraft for naval service.

References: (a) General Board's letter No. 449 of June 24, and characteristics of aircraft; (b) General Board's letter No. 403 of August 23, 1916, defense of naval shore stations against aircraft attacks; (c) General Board's indorsement No. 449 of August 4, 1916, recommending aeronautic units for advanced base organizations.

The General Board submits herewith its recommendations and characteristics regarding the number of aircraft as required by department's letter No. 3238-16 of August 8, 1916, paragraph 3.

2. Attention is invited to prior recommendations of the general board regarding aircraft construction contained in above references. Later information as to the limitations in the use of aircraft from cruising vessels, and the advisability of obtaining seaplanes of a size which can be more readily handled on board ship leads the general board to the conclusion that a small, high-speed machine is preferable to the 4,000 pound machine previously recommended for ship's use. This type should weigh about 1,200 to 1,300 pounds, have a span of about 24 feet, and a speed of about 100 miles per hour. For coastal scouting, the general board believes that a seaplane of about 5,000 to 6,000 pounds, and an endurance of about six hours, is a more suitable type at present than the 7,500-pound machine previously recommended, but experimentation with, and development of, much larger seaplanes for coastal use, for bombing dropping, etc., should be encouraged.

3. Developments abroad indicate that the small, nonrigid dirigible is valuable for coastal scouting; the general board has therefore included one such machine in each coastal patrol division.

4. The general board makes the following estimates of the probable requirements for the Navy for aircraft:

(a) For the present fleet: For each dreadnought battleship now built—2 seaplanes, 12 ships, 24 seaplanes; for each armored cruiser now built—4 seaplanes, 9 ships, 36 seaplanes; for each merchant scout of the "C" fleet—4 seaplanes, 32 ships, 128 seaplanes; total for fleet, 188 seaplanes.

(b) For future ships: Dreadnaughts building—2 for each of 5 ships, 10 seaplanes; dreadnaughts authorized—2 for each of 10 ships, 20 seaplanes; battle cruisers authorized—4 for each of 6 ships, 24 seaplanes; scouts authorized—4 for each of 10 ships, 40 seaplanes; total, 94.

(c) For land service: 1. For aviation company of advanced base force—4 seaplanes, 2 airplanes, 2 kite balloons.

(d) For coastal patrol: One division of 7 seaplanes and 1 nonrigid dirigible for each naval district (except Great Lakes), Panama, Guam, Philippines, Guantanamo, and Culebra (16 districts). (Number of districts subject to revision)—112 seaplanes, 16 nonrigid dirigibles; for defense units against aircraft attack on naval stations, units to consist of 2 seaplanes, 2 airplanes, 1 kite balloon (13 units). (Number of units subject to revision)—26 seaplanes, 25 airplanes, 13 kite balloons.

(e) Experimental—1 rigid dirigible.

(f) School machines as required.

(g) A reserve of 25 per cent of all classes of aircraft.

Summary of estimated requirements.

	Small sea planes.	Large sea planes.	Air- planes.	Kite bal- loons.	Non- rigid dirigi- bles.	Rigid dirigi- bles.
Battleships built.....	24					
Armored cruisers built.....	36					
Merchant scouts.....	128					
Battleships, battle cruisers, and scouts building and authorized.....	94					
Advanced base.....		4	2	2		
Coastal patrol.....		112			16	
Naval station defense.....		26	26	13		
Experimental.....						1
Total.....	282	142	28	15	16	1
25 per cent.....	70	35	7	4	4	
Grand total.....	352	177	35	19	20	1

School machines as required.

5. The general board recommends:

(a) That the following be constructed at once: 75 small seaplanes for present fleet; 75 large seaplanes for advanced base, coastal, patrol stations, two naval station defense units; 7 small airplanes for advanced base and two naval station defense units; 5 kite balloons for advanced base and two naval station defense units; 20 nonrigid dirigibles for coastal patrol stations; and 1 rigid dirigible for experimental purposes.

(b) That the following be constructed during the next two fiscal years: 80 small seaplanes for merchant scouts of "C" fleet each year.

(c) That small seaplanes be constructed, as needed, for supply on commissioning to battleships, battle cruisers, and scouts building and authorized.

6. The characteristics recommended for the various types of aircraft are inclosed.

(Signed) GEORGE DEWEY.

With reference to the cooperation between the Army and the Navy and the division of functions, we did not want to overlap and we did not want to duplicate efforts. We did not want to interfere with each other. As the result of a memorandum dated November 24, 1916, from the General Staff of the Army to the War Department, at the request of the Chief of Staff, they got a definite recommendation with reference to the respective areas of each, and so on. They took it up with us, and it finally resulted in a board.

Now, just to interrupt a moment there, here is a summary of November 27, 1916 (B-2-11). This is a summary of the aircraft in the naval service contracted for and in use at Pensacola aeronautic station, which shows that we had a total of aircraft of all kinds under contract of 100, we had already expended 25 in service, training, and so on, smashed up, so that up to that time we had purchased or contracted for 125 aircraft of various kinds.

The CHAIRMAN. That was November 27, 1916?

Admiral McKEAN. That was November 27, 1916. That is the summary taken from a memorandum by Lieut. Bronson to me for

my information as to the detailed status as to the number of machines etc.

The CHAIRMAN. And you say you have already put in a list showing what we had in April, 1917?

Admiral McKEAN. Yes, sir; that will come later.

The memorandum and the summary last above referred to are as follows:

B-2-10-1/2.

WAR DEPARTMENT.
OFFICE OF THE CHIEF OF STAFF.
Washington, November 24, 1916.

Memorandum for Chief War College Division.

The Chief of Staff desires a definite recommendation from the War College Division with regard to the following matters:

(a) The respective areas of responsibility of the Navy Department and War Department in defense against air attacks of shore stations in general and naval shore stations in particular.

(b) To what extent the general defense renders local defense against air attacks unnecessary.

(c) The methods of cooperation to be adopted by the Army and Navy in the development of general and local plans for this branch of defense, and for the exchange of ideas and reports on training of personnel and development of material for this purpose.

(d) The advisability of standardizing material used by the Army and Navy, respectively, for defense against aircraft.

Full consultation with the various bureaus of the War Department concerned should be held before arriving at and reporting definite conclusions.

WM. S. GRAVES,
Lieutenant Colonel, General Staff Corps, Secretary.

B-2-11.

NOVEMBER 27, 1916.

SUMMARY.

From the above it will be seen that there are in use in the Navy Air Service, contracted for, 100 aircraft, as follows: In use at Pensacola aeronautic station—aeroplanes, 12, lighter-than-air craft, 2; in use on board U. S. S. *North Carolina*—aeroplanes, 2; ready for service on board U. S. S. *Washington*, aeroplanes, 5; ready for service on board U. S. S. *Oklahoma*, kite balloon, 1; ready for service on board U. S. S. *Nevada*, kite balloon, 1; total, 23. Total serviceable aircraft, aeroplanes, 19; total serviceable lighter-than-air craft, dirigibles and balloons, 4; total, 23. Total aircraft contracted for and not delivered, undergoing inspection, test, etc., or rebuilding, 77; total of aircraft of all kinds, 100; total of aircraft expended, 25; total aircraft purchased of all kinds, 125.

This suggestion of a joint board to settle the policy between the Army and the Navy was so far as the Army was concerned, the Secretary of War to the Secretary of the Navy, December 26, 1916. I put these in to show the origin of that:

B-2-12.

NOVEMBER 29, 1916.

From: The Secretary of the Navy.

To: The Secretary of War.

Subject: Policy with regard to development of aircraft.

Reference: (a) Letter of Secretary of War of October 11, 1916.

1. I concur with you as to the necessity of establishing a definite policy in regard to the proper division between the Army and the Navy aerial activities, and defining the limits of these activities for each of the two services.

I have, therefore, appointed Capt. Hugh Rodman, U. S. Navy, Capt. J. S. McKean, U. S. Navy, and Lieut. J. H. Towers, U. S. Navy, to be members of a joint board to consider these questions.

W. S. BENSON, *Acting.*

B-2-13.

WAR DEPARTMENT,
Washington, December 26, 1916.

From: The Secretary of War.

To: The Secretary of the Navy.

Subject: Policy with reference to development of certain types of aircraft.

1. Referring to your letter of November 29, 1916, I have designated Lieut. Col. George O. Squier, Aviation Section, Signal Corps; Maj. Stanley D. Embick, Coast Artillery Corps, and Maj. Dan T. Moore, General Staff (Field Artillery), as members of a joint board to consider the questions referred to in my letter of October 11, 1916.

NEWTON D. BAKER.

Then here is a communication from the Secretary of War to the Secretary of the Navy dated December 29, 1916, the subject of which is defense against air attack. This is aircraft defense, but it was extended afterward. This letter is as follows:

B-2-14.

WAR DEPARTMENT,
Washington, December 29, 1916.

From: Secretary of War.

To: Secretary of the Navy.

Subject: Defense against air attack.

1. I am inclosing herewith papers pertaining to the question of defense against air attack and the proper joint relations between the Army and Navy in connection with this subject.

2. As many of the underlying questions of policy involved are already receiving the consideration of the joint board of Army and Navy officers detailed to investigate the question of developing a Zeppelin service, I propose, if agreeable to you, to refer these papers to the same board for preliminary recommendation and report.

NEWTON D. BAKER.

Then here is a communication of January 12, 1917, concerning the development of a Zeppelin service. There was a joint board, and finally it came down to the decision that the Navy would do the experimental work at the joint expense. That was to avoid duplication. That letter is signed by Franklin D. Roosevelt, Acting Secretary of the Navy. It is as follows:

B-2-15.

JANUARY 12, 1917.

To: The Secretary of War.

Subject: Army and Navy board re development of Zeppelin service.

Reference: (a) Plans for local cooperation of Army and Navy in naval districts; (b) Plans for cooperation in aerial warfare.

1. Replying to your letter of December 29, 1916, W. C. D. 9185-13, proposing that the papers forwarded with your letter be referred to the board of Army and Navy officers detailed to investigate the question of the development of a Zeppelin service, I have the honor to inform you that I am in hearty agreement with your proposal for joint consideration of the questions stated in the War College memorandum W. C. D. 9185-13 of November 24, 1916. These questions are, however, so intimately related to other questions requiring joint consideration that I propose that the scope of the board's study and recommendation be considerably enlarged.

2. Both the Army and Navy maintain organizations on shore for the local defense of the coast. In some cases naval stations and Army posts are within sight of each other. In war their activities would overlap. A large part of these overlapping activities would be connected with aerial warfare. I propose, therefore, that the whole subject of local cooperation of naval and military forces assigned to local defense in time of war and preparation for war be made the subject of special study, report, and recommendation by the board, with a view to the submission of their report for final consideration by the joint board.

3. I suggest that the board consider specifically the following points, but that the enumeration of these points shall not be considered by the board as in any way a

restraint on its initiative in considering any other points bearing on the general subject:

(a) The respective area of responsibility of the Navy Department and War Department in defense against air attacks of shore stations in general and naval shore stations in particular.

(b) To what extent the general defense renders local defense against air attack unnecessary.

(c) The methods of cooperation to be adopted by the Army and Navy in the development of general and local plans for this branch of defense, and for the exchange of ideas and reports on training of personnel and development of material for this purpose.

(d) The advisability of standardizing material used by the Army and Navy respectively for defense against aircraft.

It asks for extensions for the field of this board in addition to what was covered in the Secretary of War's letter. [Continuing reading:]

(e) The mission of Army aircraft operating over the sea.

(f) The mission of Navy aircraft operating from shore stations.

(g) Rules for the cooperation of Army and Navy aircraft when their missions overlap or when the situation requires cooperation either in offense or defense.

(h) The respective area of responsibility of the Army and of the Navy in defense against land attacks on shore stations in general and naval shore stations in particular.

(i) The methods of cooperation of local Army and Navy commanders: (1) In joint plan making; (2) in joint formulation and solution of problems; (3) in local maneuvers (4) in operations.

4. As these subjects are all related to general plans, I shall direct Capt. George R. Marvel, U. S. Navy, Director of Naval Districts, to act as a member of the special joint board in place of Lieut. J. H. Towers, U. S. Navy.

That was the board that is spoken of later on. Now, that was followed by the letter of January 31, 1917, from the Secretary of War to the Secretary of the Navy, which is as follows:

B-2-16.

WAR DEPARTMENT,
Washington, January 31, 1917

From: Secretary of War.

To: Secretary of the Navy.

Subject: Increase in scope of study to be made by joint Army and Navy board relative to development of Zeppelin service.

1. Replying to your letter of January 12, 1917, 26983-663:3, proposing that the scope of the study to be made by the joint board of Army and Navy officers detailed to investigate the question of developing a Zeppelin service be increased to include the following—

“(a) The respective areas of responsibility of the Navy Department and War Department in defense against air attacks of shore stations in general and naval shore stations in particular.

“(b) To what extent the general defense renders local defense against air attack unnecessary.

“(c) The methods of cooperation to be adopted by the Army and Navy in the development of general and local plans for this branch of defense, and for the exchange of ideas and reports on training of personnel and development of material for this purpose.

“(d) The advisability of standardizing material used by the Army and Navy respectively for defense against aircraft.

“(e) The mission of Army aircraft operating over the sea.

“(f) The mission of Navy aircraft operating from shore stations.

“(g) Rules for the cooperation of Army and Navy aircraft when their missions overlap or when the situation requires cooperation either in offense or defense.

“(h) The respective areas of responsibility of the Army and of the Navy in defense against land attacks on shore stations in general and naval shore stations in particular.

“(i) The methods of cooperation of local Army and Navy commanders: (1) In joint plan making; (2) in joint formulation and solution of problems; (3) in local maneuvers; (4) in operations”—

And providing that the enumeration of these points shall not be considered by the board as in any way a restrainer on its initiative in considering any other point bearing

on the general subject, I have to inform you that the suggestions meet with my hearty approval.

2. The necessary instructions have been transmitted to the Army members of the joint board.

NEWTON D. BAKER.

Then there is the report from the board of Army and Navy officers relative to development of aeronautical service, dated March 12, 1917. We went into all the questions that had been submitted to us, and under one clause they said that the board should not consider itself limited to those specific subjects, but any joint subject should be referred to it. I have not put those papers in here, but it was referred to in Admiral Fullam's testimony about a lack of harmony in the defense of our own coast. That is, our board decided on a division of the planting of mines, the placing of nets, and the responsibility for the patrol of the nets and patrol of the entrance, and the whole thing. We settled any question that was referred to us. The big, joint board was so busy, and there were so many disputed questions, that if anybody had anything he wanted to ask about in, so to speak, the no man's land of the service, they sent it to us and we decided it. Right or wrong, we gave a decision. That is here.

The CHAIRMAN. I think you had better put that in with the correspondence.

Admiral McKEAN. The whole of the correspondence?

The CHAIRMAN. Yes.

Admiral McKEAN. I will get that. I dug this up, about the air service. The misunderstanding that there seems to have been was probably due to the fact that the admiral was at sea in command of ships. This joint cooperation was decided upon in the different naval districts between the naval commandant and the military commandant, and it was covered pretty completely, more completely than it has ever been before in our country.

The CHAIRMAN. I do not think I understood you. Did you say the admiral was at sea?

Admiral McKEAN. Admiral Fullam was in command of a ship at sea. He had the command of the whole Pacific Reserve Fleet. The district commandant had command of his district, and he was talking to the commanding officer of that military division; but as between the commandant at Bremerton, for instance, and the commandant of that district there was perfect coordination. It was the same way at San Francisco, in the twelfth district. I will put that report in. I have put in the record a copy of the report of the joint board.

The report referred to is as follows:

B-2-17.

WASHINGTON, D. C., March 12, 1917.

From: Board of Army and Navy officers relative development aeronautical service.

To: Secretary of the Navy.

Subject: Report of board.

Reference: Secretary of Navy's letter, No. 26983-663; 3 Ops-17, ML, of February 1, 1917.

1. The board is of the opinion that the development of the aeronautical resources of the United States and their application in war to the maximum national advantage can be accomplished best through the formulation of plans and regulations for the joint development, organization, and operation of the aeronautical services of the Army and the Navy instead of by the separate development of each service within delimited exact areas of responsibility.

2. While the operations of the aeronautical service of the Navy will be principally over the water and those of the Army principally over the land, it may be said that a war with a first-class power will find the two services constantly operating together. The coast line and the water areas adjacent thereto will become a theater of joint operations in which the naval aeronautical service will take precedence prior to the accomplishment of an invasion, and subsequently the Army aeronautical service will take precedence if the hostile landing be accomplished, but in either case each service will be supplemental and supported by the other.

3. For the above reasons the board believes that pilots and observers for both services should be trained together, so that each service may effectively supplement the other in time of need; that joint training stations should be located on or near the coast; and that in the selection of sites for the establishment of the permanent coast stations careful consideration should be given to their suitability for joint occupancy.

4. While there is an ample field for each service to proceed along its own line in the development of the types of aircraft best suited to meet its particular needs, the board believes that the types adopted by the Army and Navy should be as nearly alike as may be consistent with the particular service required of each; that the motive machinery and control should be standardized; and that in this development there should be had the mutual interchange of ideas and joint cooperation that no obtain in the design and construction of the first Zeppelin. The board believes, also, that if either service should establish a plant for the construction of aeronautical machines or accessories, the other service should be privileged to use it under such control as may be deemed necessary by the service constructing the plant.

5. It is believed to be neither practicable nor desirable to specify the exact line at which the operations of either service should begin or end, although such a line, if drawn, would coincide approximately with the coast lines of continental United States and of each of the overseas possessions; the Army operating over the land, the Navy over the sea, but each extending its operations locally into the other's area as occasion requires. Keeping in mind, however, that the two services will be called upon in many cases to act conjointly, their respective responsibilities and spheres of action may be defined in general as follows:

Army responsibility: (a) Aircraft operating in conjunction with the mobile army; (b) aircraft required for fire control for coast defenses; (c) aircraft required for the defense of fortifications, navy yards, arsenals, cities, shipbuilding plants, powder works, or other similar important utilities, whether public or private, that are located on shore.

Navy responsibility: (a) Aircraft operating in conjunction with the fleet; (b) aircraft operating from shore bases for overseas scouting; (c) aircraft operating under the commandants of naval districts and advanced bases.

6. In general, it may be said that it is primarily the duty of the Army to defend harbors, cities, and all manufacturing, or other utilities that are located on shore, and that it should be charged with the organization of the Aircraft Service for this purpose and that the operations of the naval aeronautical service will be principally over the sea, although it will require bases on shore, probably under the commandants of naval districts. It should be the duty, however, of the Army and naval commandants in coastal districts to familiarize themselves with the plans of each other, with a view to effective cooperation, both on land and on sea.

7. Replying more specifically to the several questions set forth in the letter of the Secretary of the Navy and indented below, the board is of the opinion:

(a) The respective areas of responsibility of the Navy Department and War Department in defense against air attacks of shore stations in general and naval shore stations in particular.

The general defense of these stations should be entrusted to the Army. The necessity and character of this general defense will differ in no essential respects from those required for the defense of any other important utility, whether public or private. The local defense, in so far as it includes anti-aircraft guns, should be entrusted to the local commander.

(b) To what extent the general defense renders local defense against air attacks unnecessary.

The more complete the general defense the more secure will be the individual station or other similar utility. In general, however, such local defense should be confined to the provision of anti-aircraft guns. Aircraft, because of their mobility, should not in general be distributed and immobilized by assignment to the local defense of a particular utility.

(c) The methods of cooperation to be adopted by the Army and Navy in the development of general and local plans for this branch of defense and for the exchange of ideas and reports on training of personnel and development of material for this purpose.

Since this question refers exclusively to operations on shore, Army plans should take precedence, and naval plans should simply supplement Army plans when necessary for the defense of naval utilities. The local commanders should exchange data and plans. The naval commanders should adjust their local plans to the general plan of the Army commanders for local defense.

(d) The advisability of standardizing material used by the Army and Navy, respectively, for defense against aircraft.

The types of aircraft motors, machinery, radio sets, bombs, and other accessories should be standardized to the greatest extent compatible with the particular service that will be required of them. Standardization of guns and ammunition for defense against aircraft is desirable, but homogeneity of guns and ammunition within each service is of more importance than homogeneity of guns and ammunition used by the Army and Navy in defense against aircraft on shore.

(e) The mission of Army aircraft operating over the sea.

For the service of security and information for the territorial commander, and for fire-control purposes for the local Coast Artillery commanders, and for affording aid and assistance to both the Army and the Navy in scouting and offensive measures when operations of the enemy are in the immediate vicinity of the coast.

(f) What is the mission of Navy aircraft operating from shore stations?

To scout for and report movements of enemy forces at sea; to attack enemy forces at sea; and to assist the Army when operations of the enemy are in the immediate vicinity of the coast.

(g) Rules for the cooperation of Army and Navy aircraft when their missions overlap or when the situation requires cooperation either in offense or defense—

(1) When it appears to any local commander, either Army or Navy, that the assistance of local aircraft of the other service is needed, he should communicate in the most direct manner possible with the local commander of the other service, and the two commanders should arrange for action by the local aircraft so as best to advance the general situation of the armed forces of the United States;

(2) Both commanders should accept as the basis of their decision in all matters the general military situation rather than the special situation of either the Army or Navy;

(3) In cooperation in the performance of duties assigned to the Army, the Army should control the flights;

(4) In cooperation in the performance of duties assigned to the Navy, the Navy should control the flights.

(h) The respective areas of responsibility of the Army and of the Navy in defense against land attacks on shore stations in general and naval shore stations in particular.

The defense of all stations on shore against land attack should rest with the Army, except that measures taken within the limits of a naval station for the security of that station should be controlled by the Navy.

(i) The methods of cooperation of local Army and Navy commanders (1) in joint plan making, (2) in joint formulation and solution of problems, (3) in local maneuvers, (4) in operations.

(1) A permanent joint-planning committee should be organized within the geographical limits of each naval district, which committee should propose and solve comprehensive problems of local defense requiring cooperation of the military and naval forces within such limits.

(2) All problems in cooperation that may arise from time to time should be submitted to this joint-planning committee. The joint-plans committee should be governed by the joint plans for war. The members of the committee should consult on all questions with their commanding officers in order that the views of responsible officers shall receive expression in the preliminary plans. Local plans formulated by the joint committee should be revised as necessary and adopted by the senior local commanders of the two services.

(3) Joint plans for local maneuvers which will stimulate to actual war conditions, and which will involve the cooperation of the two services, should be frequently planned and carried into execution.

(4) The joint plans prepared as above, and perfected as a result of the experience gained in maneuvers, should form a basis for joint operations in war.

8. In order to insure effective cooperation in the development and standardization of material, the board recommends:

(a) That the Army and Navy cooperate under the Navy Department in the development of types of hydroaeroplanes after the manner already prescribed for the construction of the first Zeppelin.

(b) That, similarly, the Army and Navy cooperate under the War Department in the development of types of land aeroplanes.

Signed:

GEORGE O. SQUIER,
Brigadier General, Chief Signal Officer, U. S. Army.

STANLEY D. EMBICK,
Major, Coast Artillery Corps.

DAN T. MOORE,
Major, General Staff.

GEO. R. MARVELL,
Captain, U. S. Navy.

HUGH RODMAN,
Captain, U. S. Navy.

J. S. McKEAN,
Captain, U. S. Navy.

Approved:

NEWTON D. BAKER,
Secretary of War.

Approved:

JOSEPHUS DANIELS,
Secretary of the Navy.

Admiral McKEAN. Here is B-2-18, a memorandum to the Secretary of the Navy, prepared in my office. It is a history, the whole story up to that date. This memorandum is as follows:

B-2-18.

JUNE 25, 1917.

To: The Secretary of the Navy.

Subject: Naval aeronautics.

HISTORY OF NAVAL AERONAUTICS.

1. Aeronautics in the Navy was at the commencement of this work by the Navy placed under the Bureau of Navigation. Later it appeared more desirable to place Aeronautics under Operations, and an office of Aeronautics under Operations was created. In the spring of 1916 the office of Aeronautics was abolished, and Aeronautics became an integral part of Operations. It then was handled in the same way as any other regular branch of the naval service, that is, by the bureau method. Policies, plans, and operations were prepared in Operations, and the material supplies were handled by the bureaus concerned, and personnel by the Bureau of Navigation.

2. The act of August 29, 1916, created a Naval Flying Corps, and steps were immediately taken to draw up the necessary plans and regulations to put this act into effect. The law was construed in different ways by different officers, and it was found impossible to put the law into effective operation. The same act of August 29, 1916, also created the Naval Reserve, including the Naval Reserve Flying Corps, and this part of the law was effectively operative, and has been used to build up the personnel required for the rapid expansion during the present emergency.

DEVELOPMENT OF AIRCRAFT.

3. The department has consistently had in view the development of aircraft for use in connection with other operations of the naval forces:

First. For starting from aboard ship, and returning to the ship, for purposes of obtaining information, controlling the fire of our own guns, and opposing enemy craft being used for a similar purpose.

Second. For use over the sea, starting from shore coastal air stations in connection with the naval district surface patrol craft, in locating and destroying enemy surface or submarine craft.

4. A catapult has been developed for launching heavier-than-air craft from ships. It has been installed on three ships, and a fourth installation has been authorized. This catapult is necessarily somewhat bulky in order to accommodate the size of machine now in use, and a smaller machine, which will permit the use of a much smaller launching way, is therefore being developed in order that machines can be assigned to vessels having less space available.

5. Kite balloons have been successfully used by us aboard ship for spotting in connection with fire control, and are now being further developed for this use.

6. The development of aircraft for use at sea is much more difficult than for use over land, but from latest information received this country is as far advanced in types as any country abroad, and with the impetus given to manufacturers by the present demands much more rapid development is hoped for.

7. A nonrigid dirigible is being developed for use from air stations. The first one is now being tested, and several more have been ordered. In addition the plans of latest type of nonrigid dirigible used in England have been received and are being considered in connection with future development of this type.

8. The number of aircraft now in service and under construction as follows:

	In service.	Under construction.
Seaplanes.....	42	220
Kite balloons.....	5	12
Free balloons.....	1	1
Nonrigid dirigibles (blimps).....	1	40
Airplanes.....	3	2

TRAINING PERSONNEL.

9. When war was declared it was desired to expand the training of naval aviators as much as the facilities available permitted. Due to shortage of regular line officers in the service it was considered impracticable to assign any additional line officers to aviation instruction. Numerous applications have been received from civilians to join the naval service for special duty in aviation.

10. The best of the applicants have been enrolled in the Naval Coast Defense Reserve (class 4 of Naval Reserve Force for aviation duties), and these men are being ordered to training as rapidly as the available facilities permit. In addition to Pensacola being supplied with as many as can be handled, training camps have been established at Squantum, Mass., and Bay Shore, L. I.; an officer has been detailed to supervise training at a camp established by private enterprise, first at Palm Beach, Fla., and later moved to Huntington, L. I.; a contract had been made with the Curtiss Co. for the training of 20 aviators at their field at Newport News, Va., under the supervision of a naval officer, and the question of increasing the number at this point is now under consideration; arrangements have been made with the Goodyear Tire & Rubber Co., at Akron, Ohio, for the training at that point of 20 dirigible pilots; 100 men and 4 officers have been sent to France; the question of sending men to England or giving their men preliminary training in this country has been considered, and arrangements are now being made to send 20 men to Camp Borden, Canada, in connection with 100 Army men for preliminary training, and for the purpose of obtaining a broader view of training methods.

11. The number now under training as aviators is as follows: Pensacola, 45; Squantum, 25; Newport News, 20; Bay Shore, 25; Huntington, 27; Akron, 20; France, 104; Camp Borden, 20; a total of 186.

There are also under training 356 student airmen for seaplane and dirigible crews.

As the men in the reserve qualify as aviators it is the intention to commission them as ensigns in the Naval Reserve Flying Corps (class 5 of Reserve Force), making them available for general service in that corps.

12. In addition to those now under training, men are being enrolled and will be called to active service as soon as they can be taken care of. The two obstacles in the way of calling more men immediately are (1) Lack of instructors, (2) lack of aircraft. As aviators are qualified they will be used as instructors for others, and in this way this difficulty will be overcome.

13. Additional seaplanes are being procured as fast as they can be supplied by the manufacturers, giving due consideration to the urgent needs of the Army.

14. Representatives of the Army and Navy, with Mr. Bolling of the Aircraft Production Board, are now on their way to Europe. They form a joint board to investigate and facilitate purchase of such types of airplanes and engines as have been found best by the allies in war use. Such information and types could not be obtained while this country remained neutral.

15. In addition to cooperation of Army and Navy, there has been established, with the assistance of the Aircraft Production Board, a closer cooperation and understanding with manufacturers.

TRAINING STATIONS.

16. The United States Navy aeronautic station at Pensacola is being enlarged by addition of permanent hangars for 54 seaplanes, and temporary hangars for 12 seaplanes. This will give a hangar capacity for 92 seaplanes. Landing beach and facilities for a second flight area are being prepared in the upper bay, in order to double the number of airplanes that can be simultaneously in use for training without overcrowding the air. Construction of quarters for 1,000 additional men is also being expedited. Other general construction work is in progress.

17. A temporary single hangar and a permanent six-airplane hangar are to be constructed at the naval air station at Bay Shore, Long Island. Capacities of all stations for training purposes are being increased as rapidly as deliveries of seaplane warrant.

18. Establishment of a training station at North Island, San Diego, Calif., is under consideration.

NAVAL COASTAL AIR STATIONS.

19. According to the recommendations of a joint board of Army and Navy officers appointed by the Secretary of War and the Secretary of the Navy the cognizance of aircraft has been apportioned as follows:

"Army responsibility: (a) Aircraft operating in conjunction with the mobile army; (b) aircraft required for fire control for coast defenses; (c) aircraft required for the defense of fortifications, navy yards, arsenals, cities, shipbuilding plants, powder works, or other similar important utilities, whether public or private, that are located on shore.

"Navy responsibility: (a) Aircraft operating in conjunction with the fleets; (b) aircraft operating from shore bases for overseas scouting; (c) aircraft operating under the commandants of naval districts and advanced bases.

"6. In general it may be said that it is primarily the duty of the Army to defend harbors, cities, and all manufacturing or other utilities that are located on shore and that it should be charged with the organization of the aircraft service for that purpose: and that the operations of the naval aeronautical service will be principally over the sea, although it will require bases on shore, probably under the command of naval districts. It should be the duty, however, of the Army and naval commandants in coastal districts to familiarize themselves with the plans of each other, with a view to effective cooperation, both on land and on sea."

20. The cognizance of the Navy requires the establishment of coastal air stations as bases for aircraft operating in connection with the naval district surface patrol craft, or vessels of high sea fleet operating near shore. Strategic localities, and sites in these localities have been selected by joint Army and Navy boards, approved by the Secretary of War and the Secretary of the Navy.

21. Sites have been selected and arrangements are now being made to construct air stations at the following points: Montauk Point, Rockaway Beach, Cape May, Hampton Roads, Key West, and Coco Solo Point, Panama.

The following additional locations have been decided upon: San Diego, Pea Harbor, and Port Angeles.

The following are still being investigated: New England coast, vicinity of Savannah, Gulf coast, and West Indies.

22. Additional intermediate temporary stations would be needed if enemy operations were conducted on our coast, but these could be established as the situation demanded.

23. When these coastal stations are completed and put in operation they will be utilized to assist in carrying on advanced training, which will increase the output of the regular training stations.

PROPOSED AERONAUTIC LEGISLATION.

24. The Secretary of the Navy in December, 1916, directed the preparation of proposed legislation for Congress which could be substituted for the bill contained in act of August 29. The draft of this bill is still under consideration, but owing to the rapidly changing conditions it has not yet taken form.

25. It does not appear desirable to place the aeronautic activities of the Army and Navy under one head. The only part of these activities which it seems could be jointly operated is the supply of material, and this is not really more similar than some other supplies of material which have been obtained, and are being obtained separately by the Army and Navy, without interference or friction.

26. The military aeronautic activities of the two services are entirely dissimilar, and the personnel requires different training. For useful operation the naval aeronautic forces must be directly under the Navy, and the same seems to apply to the Army.

27. In England at the beginning of the present war an attempt was made to have a combined training school, but this was afterwards abandoned on account of the different training required. The division of aeronautic cognizance abroad is practically that recommended by the joint board on cognizance as quoted above.

28. In order to coordinate the efforts of the Army and Navy along aeronautic lines, several joint boards have been appointed. These boards are:

(a) The Joint Army and Navy Board on Aeronautic Cognizance. This board considers all questions concerning the broad principles and the divisions of cognizance.

(b) Joint Army and Navy Zeppelin Board, headed by Chief Constructor D. W. Taylor. This board has the duty of developing the large rigid type of airship for both services.

(c) Joint Army and Navy Technical Board, headed by Maj. B. D. Foulois. This board considers all questions of type, designs, specifications, and makes recommendations covering these matters. This board has the direct cooperation of the Aircraft Production Board of the Council of National Defense.

It is considered that these three boards closely bind the aeronautic activities of the two services, and receive the most effective cooperation that can possibly be obtained in any way.

29. The establishment of any aeronautic department at the present time should be for the sole reason of obtaining greater war efficiency. Greater efficiency can be obtained by keeping the various war activities more united under one head; and, at the front one man must be in command on shore and one at sea.

30. The plea for having a separate command for the air does not hold good because in the present state of development of aircraft (and any that can be now foreseen) the air service will be auxiliary to the Army and Navy. Battles may be fought in the air, to maintain superiority in the air for the purpose of obtaining information of some form to assist the main forces on land or sea, but such battles may be likened to scouting cavalry engagements incidental to the main battle.

31. The natural dwelling place of man is on the surface of the earth, and wars must be decided at this locality.

32. The surface of the water has become a well-developed route of transportation of supplies between the different portions of the land.

33. When the air becomes a dwelling place for man, or a means of transporting heavy freight between such dwelling places, then aeronautics will be of sufficient importance to warrant establishing a separate department of aeronautics, but from our present knowledge of the laws of gravitation this is impossible now.

34. As submarines work in three dimensions the same as aircraft, the same reason applies to establishing a separate department for that branch of the service.

35. Whatever may be the commercial development and usefulness of aircraft after the war, their usefulness now is for military purposes auxiliary to main operations.

36. Aircraft perform no independent major operations. Even their independent raids are not major operations, and are not their most important performance. Their greatest function is that of rendering service to other military or naval forces. This service includes providing of information by reconnaissance of scouting, and by spotting of gunfire; it includes also protective service in the preventing of enemy aircraft from securing information for enemy forces.

37. The primary duty of aircraft for service over water is with the fleets, rendering such information and protection service, or with the naval coast defense on similar duty, including the furnishing of information as to submarines. For unity of effort such auxiliary service should be under naval command. Until primary operation becomes a preponderant function of naval aircraft, the control of such aircraft should remain with the Navy.

38. The necessity for a complete change of our whole system, probably resulting in temporary disorganization and delay at this critical stage of the war, to secure cooperation which already exists is not seen, and it is strongly recommended that Congress be requested to lay aside for the present the proposed legislation for the reorganization of a Department of Aeronautics.

The next is a memorandum of April 3, 1920, also prepared in my office, showing the amounts appropriated for the naval service from year to year, starting in 1912 with \$25,000, and running up to 1920. It is as follows:

B-2-19.

APRIL 3, 1920.

Memorandum for: Admiral J. S. McKean, United States Navy.
Subject: Funds appropriated for aviation in the naval service.

1. As directed by you, I submit below a list showing funds appropriated for aviation in the naval service:

Fiscal year.	Departmental supervision.	Appropriation act.	Amount
1912.....	Bureau of Navigation.....	Naval.....	\$25,
1913.....	do.....	do.....	10,
1914.....	do.....	do.....	10,
1915.....	do.....	do.....	10,
1916.....	Chief of Naval Operations.....	Naval (unobligated balances).....	1,000,
1917.....	do.....	Naval.....	3,500,
1917-18.....	do.....	do.....	5,133,
1917-18.....	do.....	Emergency.....	3,000,
1917-18.....	do.....	Urgent deficiency.....	11,000,
1918.....	do.....	Naval.....	45,000,
1919.....	do.....	do.....	220,383,
1920.....	do.....	do.....	25,000,

NOTE.—By act of February 25, 1919, \$97,000,000 of aviation appropriations for the years 1917-18, 1918, and 1919 was repealed, and therefore that amount should be deducted from the total appropriated for those years.

Respectfully,

(Signed) LANE LACY

NOTE.—The total amount appropriated for the years 1912, 1913, 1914, 1915, 1917, 1917-18, 1918, 1919, and 1920 was \$314,071,119; \$97,000,000 subtracted from that amount leaves the amount \$217,071,119.

War appropriations.

1917.....	\$3,500,
1917-18.....	5,133,
1918.....	11,000,
1919.....	3,000,
	45,000,
	220,383,
Total.....	288,016,
Less.....	97,000,
Total.....	191,016,

Of the \$220,000,000 in 1919, \$97,000,000 was not expended or obligated, and that was turned back, so that your total expenditures of appropriations up to date are \$191,000,000.

The CHAIRMAN. Up to date? Do you mean this date, the date of that memorandum?

Admiral McKean. Up to date. That is, including the fiscal year 1920.

Here is a memorandum dated April 5, 1920, prepared at my request, of aviation personnel and matériel for 1917 and 1918. This memorandum is as follows:

B-2-20.

Memorandum.

APRIL 5, 1920

For: Admiral J. S. McKean, United States Navy.

Subject: Statistics of aviation personnel and material 1917 and 1918.

1. As directed by you, statistics of aviation personnel and material are submitted below:

Personnel.—April 6, 1917: Officers, 38; men, 163. November 11, 1918: Naval aviators, 1,656; ground officers, 1,349; student officers, 3,912; officer total, 6,917. Enlisted men, 43,452. Officers and men sent abroad during war: Officers, 1,200; enlisted men (aviation ratings), 8,215; enlisted men (aviation duty, miscellaneous ratings), 8,072.

Material.—Heavier-than-air craft on hand and on order April 6, 1917, and November 11, 1918:

	On hand.		On order.	
	April, 1917.	November, 1918.	April, 1917.	November, 1918.
Flying boats.....	6	1,170		1,921
Seaplanes.....	45	695	88	102
Land planes.....	3	242	3	10

Lighter-than-air craft on hand and on order:

	On hand.		On order.	
	April, 1917.	November, 1918.	April, 1917.	November, 1918.
Free balloons.....	0	10	0	0
Kite balloons.....	2	205	3	0
Dirigibles.....	1	15	13	30

Stations.—Number of shore stations maintained for aviation at home and abroad on April 6, 1917, and the same as of November 11, 1918: April 6, 1917, one station at Pensacola, Fla.; November 11, 1918 (total 54)— Number of stations in the United States, 23; number of stations abroad, 31.

2. The above gives the information available from the records of this office. On account of the fact that the aviation work has been distributed throughout the department, data relative to personnel and material by classes is only available in the Bureau of Navigation and the Division of Material, respectively.

Respectfully,

(Signed) LANE LACY.

The CHAIRMAN. What does "on order" mean, under process of construction?

Admiral McKEAN. Under contract, sir.

The CHAIRMAN. But not necessarily under construction?

Admiral McKEAN. You could not tell. After they got started and really going, it did not take long; but they were under contract and the date of delivery was set in all cases, just like shipbuilding.

The CHAIRMAN. You do not know when those particular planes were delivered?

Admiral McKEAN. No, sir. They could get that out of aeronautics. They have the history of every aircraft, just the same as we have of every ship, the date of contract and the date of delivery, and whether expended, or whatever happened to it.

The CHAIRMAN. I would like to have a list showing month by month the planes that were delivered.

Admiral McKEAN. What date?

The CHAIRMAN. Month by month from April 6, 1917, to the time of the armistice in 1918.

I would also like to have a list showing when those stations were established.

Admiral McKEAN. Yes, sir.

Senator KEYES. What constitutes a station? Are they different kinds and different sizes?

Admiral McKEAN. The quarters for the men, the hangars; if you have lighter than air and heavier than air hangars for both types of

machines; launching ways; and your hydrogen plant. The biggest thing is the quarters for officers and men and their accommodations.

Senator KEYES. You would have all that before you would designate it a station, would you?

Admiral McKEAN. We usually started with a piece of canvas and one machine, and then let it grow.

Senator KEYES. I was wondering, when you say "station," whether you really had the station in active operation or whether it was something simply designated as a station but consisting of a piece of canvas, as you say.

Admiral McKEAN. No; there was personnel and material operating from each of these.

The CHAIRMAN. Please have the list requested show when the stations were in operation.

Admiral McKEAN. That is, the dates of establishment?

The CHAIRMAN. And the dates when they were actually in operation?

Admiral McKEAN. I can add the number of personnel at each of these stations also.

The CHAIRMAN. Very well.

Admiral McKEAN. That is statistical data, showing the two dates. I think that is all with reference to aviation.

Now, in particular, with reference to Admiral Sims's testimony as to ships that should have been in Europe April 6, 1918, one year after the war, etc., I have taken a number of quotations from Admiral Sims's testimony which the committee will recall. Here is the first:

I do not know whether you know it or not, but up to the first year of the war we did not have much more than 100 ships of all classes on the other side, and there was not a single ship that was not available or could have been available to be over there in the first 15 days of the war. Now there is the whole point of all my statement and of my criticism.

Then from another place in his testimony I quote as follows:

The country had already gone into war on the 6th of April. If these vessels had sailed that night, and there is no God's reason why they should not have been ready to sail, and gotten into the thing by the end of April, the decrease in the losses you speak of in July, would have begun then, and we would have saved 2,500,000 and we would have been able to put an army into France by May 1, 1918, of a million men.

Then here is another quotation:

We declared war on the 6th of April, and there was not a single force on the other side until the 4th of May. What do you know about that for preparation for war. And I can give you the dates when they arrived—another bunch of ships—and I can show you that after two months there were only 30 destroyers there. I can show you that at the end of a whole year there were approximately 120 vessels of all classes, including supply ships. Not one of those ships was built since the war. There was no reason why they could not have been all sent over immediately upon the declaration of war, and if they had been there we would have put the submarine campaign out of operation and decreased the losses. I do not know why they did not send them over there. The good Lord only knows why they did not send them over there, but they did not send them at all.

Then here is another quotation:

There was a war going on over there and they did not send the ships over. It was months before any of them got there.

There is appended hereto an official list of vessels in European waters on April 6, 1918. This list shows that on that date there were 139 United States vessels of all classes engaged in antisubmarine and convoy work. This list shows the dates of sailing and dates of

This list shows a total of 59 destroyers, six of which were not built when we went into the World War.

Special attention is called to that quotation.

The CHAIRMAN. Were these ships over on April 6, 1918?

Admiral McKEAN. Yes, sir.

(The list above referred to is here printed in full in the record as follows:)

List of vessels in European waters Apr. 6, 1918.

¹ These vessels were in the United States Navy prior to declaration of war.² Commissioned in European waters Aug. 27, 1917.³ Interned at Constantinople, Turkey.⁴ Executive order.⁵ Captain commandant, Coast Guard, ordered to equip for distant service by the Chief of Naval Operations, letter July 30, 1917.

Admiral McKean. This same list shows that there were 6 tenders or repair ships, 7 gunboats, 2 cruisers, 12 submarines, 5 battleships, and 1 mine layer, all Government owned on the date of declaration of war, and it shows the date of sailing and date of arrival.

It shows also a list of 26 yachts, only 2 of the 26 being Government property on the date of the declaration of war. This list shows the date on which these vessels were taken over from private parties by

purchase or otherwise, the date of their commissioning, the date of their sailing, and the date of their arrival, so that Admiral Sim's statement in reference to this type was only true as to 2 out of 26; and of these 2 Government owned yachts he should have known, and undoubtedly did know, that one of them, the *Scorpion*, was interned at Constantinople, Turkey, and was therefore not available for his use in London or anywhere else.

This shows a list of seven tugs, five trawlers, and four mine sweepers, none of which were owned by the Navy Department on the date of declaration of war. The table shows the date they were taken over by the Navy, dates of sailing, dates of arrival in Europe, and the date of commissioning where this date differs from the date they were taken over.

There is also a list of five Coast Guard cutters which came under the Navy Department on the declaration of war and were assigned to the district forces until July 30, 1917, when they were turned over to the commandant of the Coast Guard for equipment for service abroad. The list shows the date of sailing of these vessels and their date of arrival on the other side.

To sum up, this list shows that of the total of 139 vessels of the antisubmarine and convoy types in Europe on April 6, 1918, there were 6 destroyers not completed, 24 yachts not even owned by the Government, 7 tugs not owned by the Government, 5 trawlers not owned by the Government, and 4 mine sweepers not owned by the Government, or a total of 45 vessels out of 139 covered by Admiral Sims's statement which were not Government-owned vessels on the declaration of war, and in addition 5 Coast Guard cutters fitted for coastal work only, without the proper guns, etc., for overseas duty. Adding these, we have a total of 50 vessels which could not possibly under the conditions have been sent abroad according to Admiral Sims's statement. In addition, it is to be remembered that of the remaining 54 destroyers there were a great many of them old, worn out, and that could not be expected to be in complete repair on the outbreak of war. In addition, there is one converted yacht, the *Isabel*, which we converted into a destroyer after her purchase by the Government. In other words, Admiral Sims's statement as to numbers alone in Europe was 39 from the whole truth. The number owned by the Government and available for going to Europe on April 6, 1917, was 50 from the truth, and the attention of the committee is called to the fact also that there are at least 30 out of this 50 that could not proceed to Europe without convoy fuel ships, etc., and that it would take all of 15 days in favorable weather for them to steam across the Atlantic, so that they could not be expected instantaneously.

Now, here is a list of vessels that has been checked over carefully and I think is correct in every detail. This is the list C-2 that was submitted previously of the destroyers in 1917, with the complements on board in January, 1917, and March 31, 1917. This was submitted previously by Capt. Pratt.

(The list referred to last is here printed in full in the record, as follows:)

1 Active duty.

2 Reserve.

3 Ordinary.

Admiral McKEAN. In this connection, the following extracts from Capt. Twining's testimony before the Fletcher court of inquiry, as reported in the Army and Navy Register of April 17, 1920, are quoted for the committee's attention:

Admiral Sims was not of the opinion in July and August that it was expedient to send oil-burning destroyers to Brest, for these craft were fully employed from the Queenstown base doing the same work as the forces based on France, and their time would not have been fully occupied. The Queenstown destroyers were employed 65 to 75 per cent on useful work in bringing in supply ships when cargo ships were more vital than transport ships. Another reason for not transferring vessels to Brest was

the lack of facilities there, especially in supplying oil. At that time the submarine campaign was at its height, and every military vessel traveling through the danger zone was an additional responsibility. It was recognized that Brest was of great strategic importance, and British officers often expressed the wish that many destroyers could be based there. When the Queenstown force was increased so that all destroyers available could not be accommodated there, additional forces were supplied Brest.

Also, as quoted from the same source from Admiral Sims's own testimony:

Replying to questions asked by Admiral Fletcher's counsel, he told in detail the concern among the Allies over the rise in losses and decreasing curve of the shipbuilding program. As to the Queenstown destroyers, they were engaged in protecting cargo ships, as few troops were coming in at that time. He had received his orders that troops must be protected even at the expense of merchant shipping. He would have used all the 35 Queenstown destroyers to protect convoys, "but that would not have been done by a decent man," adding: "We should have lost the war had those 35 destroyers not been there, for they furnished the balance of power to the Allies against the submarines."

In this connection Admiral Wilson's testimony before the committee is referred to——

The CHAIRMAN. That is before what committee; before this committee?

Admiral McKEAN. Yes, sir; before your committee here. Admiral Wilson's testimony before this committee is referred to, showing that Admiral Sims, after the sinking of the *Antilles*, sent his first lot of destroyers to Brest, and that after the sinking of the *President Lincoln* he revised his previous attitude as to convoy of troopships, and sent the necessary destroyers to Brest, and in a letter to Admiral Bayly, Royal Navy, justified his detachment of these American destroyers from Queenstown by a very illuminating chart study. Undoubtedly, the chart study was convincing even to Admiral Bayly. Why the same chart study, taken in connection with Admiral Sims's positive orders from the department "that troops must be protected even at the expense of merchant shipping," was not made before and acted upon before is not understood.

From events as they developed during the war and came to my knowledge, from Admiral Sims's letter and testimony, I had been inclined to think that Admiral Sims was very much impressed with the apparently vital necessity of bringing food and munitions into England, which fact was impressed upon him, of course, three times daily in London, and that he had taken an attitude exaggerating the importance of cargo ships and their contents in comparison with the absolutely vital necessity of securing the safety of the troop transports up to the limit of our abilities. I was not in possession of any statement definitely giving this as the London office's view until I read the statement from Capt. Twining's testimony cited above:

The Queenstown destroyers were employed 65 to 75 per cent on useful work in bringing supply ships when cargo ships were more vital than transport ships.

In further explanation of Admiral Sims's attitude of mind and furnishing what I have finally come to the conclusion is the key to this whole discussion, and to Admiral Sims's idea that the Navy Department did not understand him, did not support him, and did not enter whole-heartedly into the war, I quote from the Army and Navy Journal of April 17, 1920, page 1012, third column, paragraph 5:

In a report of the hearings in the Fletcher court of inquiry, Admiral Sims being the witness, "Asked what he meant by warning Admiral Fletcher that in case of the loss

of a ship nothing will save your head or mine, Admiral Sims said it was an admonition, meaning that 'both of us would get racked for it, that's all.' There was a political significance in the loss of ships, he said. In further explanation of 'political significance' he said, 'It may seem heartless for me to say so, but under the conditions it would have been better to have lost troop transports, for we had to save cargo ships at all hazards.' "

As stated above, and prior to my having read this last quotation, I had become impressed with Admiral Sims's over-exaggeration of the importance of cargo ships, but this last quotation shows in his own words that he had got himself into a state of mind in which cargo ships and their cargo took precedence over American troop transports and the troops they carried. I wish here and now to state that in my opinion there was at no time any official or officer of the Navy Department who took this view of the relative importance of cargo, whether British or American, being superior in value or more vital in winning of the war than were the lives of our American soldiers.

After studying Admiral Sims's letter, hearing all the testimony so far presented to the committee, I have come finally to the conclusion that the real cause of this whole investigation lies in the distorted view expressed above by Admiral Sims, and this is the only intelligent, fundamental cause that I can find.

Next is a copy of a letter of Admiral Sims to Vice Admiral Sir Lewis Bayly, at Queenstown, which has already been introduced in the record.

The CHAIRMAN. When was that?

Admiral McKEAN. June 1, 1918, just after the big drive.

The CHAIRMAN. Let that go in.

Admiral McKEAN (reading):

ESCORT ADVANTAGES OF BREST OVER QUEENSTOWN.

[Admiral Sims to Vice Admiral Sir Lewis Bayly, Queenstown.]

LONDON, June 1, 1918.

Referring to your letter of May 19, concerning the relative advantages and disadvantages of escorting troop convoys by destroyers based on Queenstown and on Brest, I have had this matter analyzed by Commander Long, in consultation with the Convoy Section of the Admiralty, and I inclose herewith two memorandums covering these points. I also inclose your letter of the 19th, as you may not have retained a copy of it.

From an examination of these memorandums, it now seems that it would be really advantageous to base the escorting destroyers for our troop transports on Brest.

First, let me say that I have just received information from the department that the three new destroyers at the Azores have been turned over to me and that two new destroyers are coming out directly accompanying troop ships, and are to be retained on this side. These destroyers are as follows: The *Little* (Taussig), *Kimberly* (Johnson), *Connor* (Howe), *Sigourney* (Vernou), and the *Stevens* (Zogbaum).

You will note that four of these are commanded by some of our most experienced escort commanders. As they will need the services of some of these men at Brest, I am sending Taussig's and Vernou's destroyers there. Johnson's and Zogbaum's boats will be sent to Queenstown, thus giving you two experienced commanders. The *Connor* will probably go to Brest. Some time later nine other boats from Queenstown can join the *Little*, the *Sigourney*, and the *Connor*, thus completing the escorting group for troop transports.

The five new destroyers will ease up the situation considerable at Queenstown, not counting the several destroyers now under repairs that will be out soon.

Without having any definite information as to dates, I understand that additional new destroyers will come out before long. I think the department's intention is to make use of them as escorting vessels on the way out.

With the destroyers based on Brest, the legs of the triangle are as follows: Five hundred and ten out to the rendezvous escorting empty transports off the coast, 600

miles escorting troops into the coast, 150 miles returning to Brest from St. Nazaire in case the latter port is the port of destination. In all, this is 1,110 miles escorting and 150 miles not escorting. A total of 1,260 miles.

From this it is evident that destroyers based on Brest can be used with much greater economy of both destroyers and oil.

We expect before long to have a very considerable number of torpedo chasers (110-foot) on this side. Some of these will be based in the Channel and some in the Irish Sea. We hope that these will make it much livelier for the submarine to say the least, not counting the services of the new destroyers, which I hope will be arriving soon.

I expect to be off Monday or Tuesday of next week to visit the mine-laying base in the north. A number of very fine mine layers have just arrived and arrangements are being made to go ahead with the barrage. Upon my return I will have to attend the next meeting of the Inter-Allied Naval Council, and shortly after that I hope to be able to get away for a visit to Queenstown.

However, these are stern and anxious times, and one can never tell when plans will have to be changed.

Very sincerely, yours.

I have here a memorandum in reference to the Navy's policies, which I present in view of some testimony or statements made, and in view of the danger of misunderstanding I think that it should be cleared up. [Reading:]

APRIL 16, 1920.

NAVY'S RELATION TO POLICIES.

There seems to have been some misunderstanding of certain testimony given by certain officers who have appeared before the committee as to the Navy's idea of its relation to the national policies, naval policies etc.

It is important that there should be no misunderstanding of the Navy's conception of its functions in this respect, and that this situation may be cleared up I will give my personal views relative thereto, and I believe these to be the views of a very large per cent of the officers of the service, if not all of them.

The Navy has nothing to do with the formulation of national policies except when called upon for its technical advice by the Congress or the administration as to the Navy which would be required to carry out any policy which the Government contemplates establishing. A case might arise where the adoption of a desirable policy would be shown by the naval and military experts to be too expensive in the Army and Navy; that the Government authorities would rather forego the policy than to stand the expense.

After the adoption of a national policy by the Government, the Navy Department should be informed of this policy, so that it may take the necessary steps to provide an adequate Navy to meet the Navy of that government or those governments with whose policy the adopted policy conflicts; in other words, the Navy and Army should always be familiar with our policies and with the policies of foreign governments with which our policies are liable to conflict. In this way, they, the Army and Navy, can determine the most probable enemy or enemies, and thus obtain a scientific premise on which to base the estimates of the Army and Navy needed to defend our policies.

This is the only logical way that I know of for the Army and Navy to make proper estimates of the Army and Navy necessary for our country. Any other basis would be a pure guess, liable to be too expensive for economy on one hand or too small for efficiency on the other. A navy too small to carry out its mission is the most expensive in money and lives that any country can possibly indulge in. It leads the unthinking to a false security, and instead of carrying out the primary purpose of the Navy, which is to prevent war, it is liable through its very weakness and inefficiency to invite war.

To show the method we follow, there is submitted herewith a copy of the tentative plan of war portfolio. The original of this was produced by Capt. Schofield in the Naval War College in March, 1912. As will be noted from the plan, it involves the State Department, War Department, and Navy Department, each engaged along its own line in estimating the situation and the probabilities of war with any nation.

After a study of policies by the State Department, this includes enemy policies and our own, comparing both of them with international law to show their justice and to show where they conflict. The Army studies the enemy's army, the Navy studies the enemy's navy, and the joint plan-making body, consisting of the Army and Navy, with a State Department advisor or member, meets, when a grand estimate of the situation is made and a decision reached, submitted to the supreme authority—that is

the President, Commander in Chief of both Army and Navy—who issues to the Army and Navy a combined letter of instructions, which comprehends a statement of the strategic plan as embodied in the grand decision, and instructs the War and Navy Departments as to their duties in the execution of the general plans, and makes, as between the two services, the initial distribution of resources, including funds, manufacturing facilities, etc., of the country.

Based on this combined letter of instructions, the naval plan-making body and the Army plan-making body make their service estimates of the situation, and from these are deduced, or on the decision is based, the plan of organization for war, plan of mobilization, logistic plan, plan and organization of temporary bases. On this estimate is based a naval letter of instructions from the Navy Department to the commander in chief of the fleet. This letter includes a statement of the strategic plans and the instructions based on the naval decision and the appended plans. This war portfolio should be in the possession, or copies of this war portfolio should be in the possession, of the commander in chief.

I explain there the theoretical building-up policies. That is based on the detailed plan of a war portfolio gotten up by Capt. Schofield at the Naval War College in 1912, and it shows the different processes that we would go through theoretically in the State Department, the War Department, and the Navy Department to reach a grand estimate of the situation on which the Commander in Chief, the President, would base his letter of instructions to the two services. On that letter of instructions and the general plan the Army and the Navy would each take up and work out its own problems, and you would finally get down to it, and there are your general war plans of the General Board, and from these are deduced, or on the decision is based, the plan of organization for war, plan of mobilization, logistic plan, plan and organization of temporary bases.

Senator PITTMAN. Admiral, may I interrupt you there? Several of the witnesses have spoken of a logistic plan of the war. Would you mind reverting just for a second and giving a definition of the word "logistic" in that connection; purely for the record?

Admiral McKEAN. Yes, sir; I can do that. I was assigned to that subject at the War College once, and I took about three weeks finding out what "logistics" meant.

Logistics, broadly defined, is the science or art of preparing an army or navy for war, the movement of that army or navy to the scene of the war, and its maintenance in fighting condition in the area of that war. It includes, in the Navy, the fitting of the ships, their equipment, their supply of fuel and food and men, their movements across the seas to the scene of the operations, their repair, and maintenance in food, clothing, ammunition, and everything that goes with it, on the scene of war, to get ready to fight.

The same way with an army. An army's logistics are much more difficult than ours. There is more difficulty of transportation, and so forth. We carry our beds, our hospitals, our immediate supplies and our fuel and cantonments, with us—that is, the ship. In the organization of the army logistics involves an immense number of details that we do not have any trouble with. Each unit is complete and is self-sustaining for a certain length of time; even the sick people, until we get to the hospital ships, and then we put them aboard there. When we run out of fuel there is a fuel ship comes alongside. When we get short of grub, there is a storage supply ship comes along. If we get short of clothing there is a supply ship with clothing and consumable stores of all kinds comes alongside.

The Army has to do with motor lorries and wagons. It takes so many more units. Of course, the distances are less for the Army, but their problems are much more complicated than ours.

Senator PITTMAN. It involves a survey of the total production and possible supply of the country?

Admiral McKEAN. Absolutely. It runs back to the smallest little blacksmith shop at the mountain crossroads and every potato patch, and it goes clear to the war front; and that is a big thing. I am afraid that the exhaustive information that the War Industries Board collected of our resources during the war is going to get adrift and be lost if we do not have those records classified, and so on, and preserve them. If we lose them we will have to do it all over again, and that will take a long time. There is more information gathered together now about the industries of this country and about logistics, commencing at the country crossroads and going clear through to France, than we will ever get again, without another war.

Senator PITTMAN. Do you know whether there is any way provided at the present time of perpetuating this information and keeping it more or less up to date?

Admiral McKEAN. I do not; no. I know that the Navy Department is keeping its stuff and getting the history of it; but ours is very small. The War Department is undoubtedly doing the same with its particular stuff.

What the War Industries Board is doing and where their records are and how they are being handled I do not know, but I do know the immense value of them, and I do know that we should keep them together, and I do know that they should be stored in fireproof buildings and cared for and put in useful form, because it would take us just as long again as it did this time to collect that information.

Senator PITTMAN. And it would be just as necessary for the Army as for the Navy?

Admiral McKEAN. Much more so. Their problem is bigger and different. The Army problem is to the Navy problem on that side something in the ratio of their numbers. We got up to 500,000, when they were headed for 5,000,000.

The CHAIRMAN. So that 5 or 10 years from now it would have to be brought up to date?

Admiral McKEAN. Yes; its value would decrease with age.

The CHAIRMAN. Unless it was kept up to date?

Admiral McKEAN. If it was kept up to date it would be useful at any time; and if it did get a little behind it would be a good deal better than to start from the ground up again.

Senator PITTMAN. I asked my question for the reason that in the preparation of the United States naval bill it should be consistent. We have already passed the present naval bill, and in that bill there was an amendment inserted by the Senate committee that provided for the establishment of data relating to reserves.

Admiral McKEAN. That is fine.

Senator PITTMAN. That the committee considered very valuable, so that they might have a complete index of the availability of reserves and the location of reserves.

Admiral McKEAN. Yes, sir; reserve personnel and reserve supplies. I have here a blue print of the tentative plan of a war portfolio. I

will leave this copy for you. You will note that the logistic plan for war has as its first clause:

(a) The initial requirements as to supplies of all kinds.

The CHAIRMAN. Is this the plan you had?

Admiral McKEAN. This is the official plan that we worked on. This has never been published.

The CHAIRMAN. When was this drawn up?

Admiral McKEAN. In March, 1912, and we have used it. The joint Army and Navy board is working on these lines now, and I think that the State Department is or soon will be cooperating so that this, which has been a naval War College dream except so far as the Navy is concerned, is coming into its own. I will just read this logistic plan. [Reading:]

LOGISTIC PLAN FOR WAR.

This plan must show:

- (a) The initial requirements as to supplies of all kinds.
- (b) The probable requirements for subsequent phases of the war.
- (c) The sources of supply and supplies available.
- (d) The organization of the transportation.
- (e) The organization of the naval train.
- (f) A list of available vessels, their characteristics, whereabouts, and places of assembly and alteration, and period required to place them in readiness.
- (g) Detailed plans for necessary changes in the vessels of the train.
- (h) Detailed plans for the assemblage of supplies.
- (i) Plan of the purchase, inspection, and shipping organization.
- (j) Orders necessary for execution of plan.

That same applies to these other subheads: "Plan of organization for war," "Plan of mobilization for war," and "Plan and organization of temporary bases."

I think that is one of the most valuable studies that ever came from a naval war college, including all of Capt. Mahan's books. I will leave it with you.

As will be seen from the above, and as I have previously stated, the Navy has nothing to do with determining national policies, but it does have the responsibility of deducing from these national policies the necessary naval policies to provide for the enforcement of the national policies.

What I wish to make clear is that from every point of view in our Government, the Navy is the servant of the Government, and under no conditions and at no time, does it desire, nor should it be permitted, to dictate policies. This should not be true in an autocratic government, it can not be true in a democratic government such as ours, and no officer contemplates the Navy's taking such attitude.

In this connection the committee's attention is called to a question asked Admiral Niblack where it was suggested that a naval officer might disapprove a national policy, and that such personal disapproval would affect his action. I can imagine cases where an American naval officer might not approve a national policy, but I can not imagine any case where he would disapprove, except by official recommendations made to his immediate official superior, and only then as a technical advisor to show his immediate official superior the dangers, difficulties, expenses, etc., of the policy referred to. But I do not believe that any officer would permit his own personal

attitude or interpretation of a policy to affect his personal or his official action under that policy. That is not the way we are trained.

Also, in this connection, the committee's attention is called to the statement of Admiral Sims in reply to a question of cross-examination, page 301, last paragraph: "We naval officers have made up our minds to one thing, and that is this: That we will never go into another war in the condition in which we went into this. Do not make any mistake about that." I do not believe that even Admiral Sims, under the stress of cross-examination, meant what he said. Further, I am sure that this expression does not and will not meet the approval of "We naval officers." "We naval officers," as I know them after 40 years' service, are neither Prussian militarists or Russian Bolsheviks. We have done as we were ordered. We will continue to do so. That is our job as we understand it under our system of government.

There have been many criticisms of our system. I agree with Capt. Pratt that whatever faults and whatever shortcomings there might be or might have been, or will be in the future, it is more a fault of the system than of any individual or individuals.

And as I stated in a previous heading, it is my opinion that the responsibilities of the Chief of Operations should be definitely stated in the law, and that the authority conferred upon him should be coextensive with these responsibilities.

It is further my opinion that there should be but one naval advisor of military matters, this to prevent confusion and friction, and to permit the Congress and the people to fix the responsibility for the preparation of the fleet for war, and its operation in war.

There has always been a great deal of opposition to a naval general staff. This opposition is based on the theory, apparently, that such a staff would weaken the control of the civilian Secretary. There are certain military functions which must be performed by some body of trained officers, such as the making of war plans, the training of the fleet for war, and its operation during war.

It doesn't make any difference whether you call this body the "general staff" and its head the "chief of staff," or whether you use its present name, the "Office of Operations," and call its head the "Chief of Operations." Whatever the name, the functions must be performed by some one.

The fear that this body will dominate the Secretary is entirely unfounded. Their functions are limited to purely military matters, so technical that no civilian Secretary without any experience can be expected to be competent to handle them. It takes a naval officer a lifetime even to try to fit himself for the job. The Secretary need have no fear of either the organization or its head, for he can at any time change the whole personnel overnight.

From nearly three years' experience in the office of the Chief of Operations, and having held both of the leading assistant positions, and having also acted as chief for seven months, I am convinced that the law creating the office should be revised so as to make the Chief of Operations fully responsible under the direction of the Secretary and the President for the fleet's development, maintenance, training, and operation, and that he should be given the necessary authority and the necessary assistance to enable him to properly meet these responsibilities.

He should, while holding the office, be the senior admiral in the Navy that is provided now, with the full pay and allowances of general in the Army; this to include proper transportation facilities for his personal semiofficial and official use.

His senior assistant, the "Assistant Chief of Operations," should for military reasons and efficiency be, during the time he holds the office, the senior vice admiral in the Navy. The senior assistant who is his chief of staff and who in his absence succeeds to his functions, as happened in this war—Capt. Pratt and I had it for about a year and three months altogether—should be the coordinating authority of the rest, under a chief. He should have the rank of vice admiral. It was sometimes embarrassing for us, as a captain or a camouflaged rear admiral, to be giving orders to admirals at all that sort of thing, and in a real military organization it does not go. It is liable to produce friction.

The CHAIRMAN. What do you mean by a camouflaged vice admiral? Admiral McKEAN. Temporary.

The CHAIRMAN. Does not this provide for that?

Admiral McKEAN. By temporary arrangement, so long as he holds the job, just as the chief of the bureau is now. This is liable to slip off between two days, you know. There is nothing permanent about that.

The CHAIRMAN. It can be taken away while you are still in office.

Admiral McKEAN. Oh, yes, sir. Admiral Niblack, I think, said that all along, during the war, through a sort of gentleman's agreement with the bureaus, I was working directly with the bureaus as assistant for material. There was not any gentleman's agreement. It was just officers doing their duty. The Chief of Operations should have assistants as follows:

Assistant for personnel.

Assistant for material.

Assistant for inspections.

Assistant for plans.

Assistant for communications.

Assistant for information (now Director of the Office of Naval Intelligence).

Assistant for naval districts.

Whether these should be assistants on the same level, as assistants for personnel, material, and inspections, I doubt. It is not necessary that they should have the same rank as the others. But they should be subordinates of the Chief of Operations. There comes in the trouble of rank. I was a captain and was trying to coordinate the duties of men who were rear admirals, most of them permanently; some of them who had been for three or four years; but even my juniors who were acting chiefs of bureaus for four years were, for a military purposes, my seniors in rank and also in pay. But it is not conducive to efficiency, and it is liable to cause trouble. It did not but it helped to train me a little in diplomacy before I got through with it.

The CHAIRMAN. The assistants for personnel, material, and inspections should not have direct authority over the chiefs of bureaus; should they?

Admiral McKEAN. They do not need direct authority. They are all under the control of the plan as approved, and when you get the

plan, they have a common objective. The old bureau jealousies of the old days, I hope that is all gone, because now we have a common objective to work for, and we are all busy, and each sees his line to work on. That reduces friction. It used to be that the bureaus did not have any terminus they were bound for, they did not have definite limitations; they overlapped; and the chief of a bureau spent most of his time trying to gather in some of the functions of the other fellows, to magnify his office; and there is where a lot of the trouble came, and a lot of the Navy Department trouble came. I do not believe we have had any of that since Operations was established, because we all had immediately something we were shooting at, to obtain, and we were playing a team game instead of just individual games.

The CHAIRMAN. But what I mean is that under your plan the chiefs of bureaus would still have entire charge of the bureaus?

Admiral McKEAN. Oh, absolutely.

The CHAIRMAN. And the assistants would be more in the nature of liaison officers between your bureau and the bureaus?

Admiral McKEAN. Yes, sir; but the principle we work on and the fundamental doctrine of Operations from the day it was organized has been never to interfere with the interior economy of any bureau or any navy yard. Tell them what you want; give them the plan—their part of it; inspect the results. But it was their job, their duty under the law and under our conception of our duty. There it was. We did not interfere; and when any of us forgot ourselves the chief was very prompt to rap us across the knuckles and put us back where we belonged; and when I say, "us" that did happen with some of the juniors. As they came in, if from lack of experience they stepped over the fence, they were warned off, and we apologized to the fellow whose business had been interfered with.

The CHAIRMAN. But this plan is for operations for the future?

Admiral McKEAN. Yes, sir. I have suggested legislation, if you wish to go that far with it.

The following memorandum, submitted by Admiral McKean, is here printed in the record.

NEW LEGISLATION.

Repeal:

103 (1) There shall be a chief of naval operations, who shall be an officer on the active list of the Navy appointed by the President, by and with the advice and consent of the Senate, from among the officers of the line of the Navy, not below the grade of captain, for a period of four years, who shall, under the direction of the Secretary of the Navy, be charged with the operations of the fleet, and with the preparation and readiness of plans for its use in war. (Act Mar. 3, 1915.)

(2) Hereafter the chief of naval operations, while so serving as such chief of naval operations, shall have the rank and title of admiral, to take rank next after the Admiral of the Navy, and shall, while so serving as chief of naval operations, receive the pay of \$10,000 per annum and no allowances. All orders issued by the chief of naval operations in performing the duties assigned him shall be performed under the authority of the Secretary of the Navy, and his orders shall be considered as emanating from the Secretary, and shall have full force and effect as such. To assist the chief of naval operations in performing the duties of his office there shall be assigned for this exclusive duty not less than 15 officers of and above the rank of lieutenant commander of the Navy, or major of the Marine Corps: *Provided*, That if an officer of the grade of captain be appointed chief of naval operations he shall have the rank and title of admiral, as above provided while holding that position: *Provided further*, That should an officer, while serving as chief of naval operations, be retired from active service he shall be retired with the lineal rank and the retired pay to which he would be entitled had he not been serving as chief of naval operations. (Act Aug. 29, 1916.)

And substitute:

"There shall be a chief of naval operations who shall be an officer on the active list of the Navy appointed by the President, by and with the consent of the Senate, from among the officers of the line of the Navy, not below the grade of rear admiral, for a period of four years, who shall, under the direction of the President, or of the Secretary of the Navy, under the direction of the President, be charged with the development, maintenance, and operation of the Navy, and with the preparations and readiness of plans for carrying out the foregoing. To assist the chief of naval operations in performing the duties of his office there shall be assigned for this exclusive duty an assistant chief of naval operations, an assistant for personnel, an assistant for material, an assistant for inspection, and such other officers as the chief of naval operations may deem necessary. The chief of naval operations shall perform such other naval duties, not otherwise assigned by law, as may be assigned to him by the President.

"The chief of naval operations, while serving as chief of naval operations, shall have the rank and title of admiral, and shall while so serving as chief of naval operations receive the pay of \$13,500 per annum and allowances, including automobile. The assistant chief of naval operations shall, while so serving, hold the rank of vice admiral, the assistant for personnel, the assistant for material, and the assistant for inspection, shall while so serving hold the rank of rear admiral, but be senior to chiefs of bureaus, and in the absence of the chief of naval operations will perform his duties in the order named.

"All orders issued by the Chief of Naval Operations in performing the duties assigned him shall be performed under the direction of the President or of the Secretary of the Navy, under the direction of the President, and his orders shall be considered as emanating from the President or the Secretary of the Navy, under the direction of the President, and shall have full force and effect as such.

"Should an officer while serving as Chief of Naval Operations be retired from active service, he shall be retired with the lineal rank and the retired pay of a rear admiral of the upper nine."

Change:

104 (1) The business of the Department of the Navy shall be distributed in such manner as the Secretary of the Navy shall judge to be expedient and proper among the following bureaus:

- First, a Bureau of Yards and Docks;
- Second, a Bureau of Equipment;
- Third, a Bureau of Navigation;
- Fourth, a Bureau of Ordnance;
- Fifth, a Bureau of Construction and Repair;
- Sixth, a Bureau of Steam Engineering;
- Seventh, a Bureau of Supplies and Accounts; and
- Eighth, a Bureau of Medicine and Surgery (sec. 419 R. S.), as follows:

The business of the Department of the Navy shall be distributed in such manner as the Chief of Naval Operations, under the direction of the Secretary of the Navy, shall judge to be expedient and proper among the following bureaus:

- First, a Bureau of Yards and Docks;
- Second, a Bureau of Equipment;
- Third, a Bureau of Navigation;
- Fourth, a Bureau of Ordnance;
- Fifth, a Bureau of Construction and Repair;
- Sixth, a Bureau of Steam Engineering;
- Seventh, a Bureau of Supplies and Accounts; and
- Eighth, a Bureau of Medicine and Surgery (sec. 419 R. S.).

Change:

104 (2) The several bureaus shall retain the charge and custody of the books or records and accounts pertaining to their respective duties, and all of the duties of the bureaus shall be performed under the authority of the Secretary of the Navy, and their orders shall be considered as emanating from him and shall have full force and effect as such (sec. 420 R. S.) as follows:

Change the words "under the authority of the Secretary of the Navy" to read "under the authority of the Chief of Naval Operations under the direction of the Secretary of the Navy."

Change:

104 (5) The General Board of the Navy shall, under the direction of the Secretary of the Navy, perform such duties as are set forth in section 13 of this chapter and such additional duties as may be prescribed from time to time by competent authority as follows:

Change from regulation and make law—

The General Board of the Navy shall, under the direction of the Chief of Naval Operations under the direction of the Secretary of the Navy, perform such duties as are set forth in the following paragraphs and such additional duties as may be prescribed from time to time by competent authority.

(a) "The General Board shall be composed of Chief of Naval Operations, the Assistant Chief of Naval Operations, the major general commandant United States Marine Corps, the assistant for personnel, the assistant for material, the assistant for inspection, the Director of Naval Intelligence, the chiefs of all bureaus on matters concerning their bureaus, and such officers as the Chief of Naval Operations, under the direction of the Secretary of the Navy, may designate.

"This function of this board shall be purely advisory. It shall be within their province to consider any subject presented in due form at any meeting. Executive meetings will be held once a week, at which either the Chief of Naval Operations, Assistant Chief of Naval Operations, the assistant for personnel, assistant for material, or assistant for inspection shall preside. It shall be the duty of the Secretary of the Navy to call a meeting of the General Board at any other time he may so desire to consider and be advised upon any subject he may present to the board, and to demand if he so desires both the majority and minority reports on the subject for further advisement and adjustment between himself and the Chief of Naval Operations.

"The annual report of the General Board as constituted above shall be submitted to the Secretary of the Navy for incorporation and publication in the Secretary's Annual Report with such comments or recommendations as he, the Secretary, may desire to make thereon."

All other articles and paragraphs of articles under chapter 2, section 1, not otherwise changed by above law shall stand as at present.

Admiral McKEAN. To continue, the Chief of Operations should ex officio be head of the General Board, which board should be composed of his assistants who are heads of divisions, and in addition the chiefs of bureaus should be ex officio members and should be present at all discussions of general policies. So that they are in sympathetic touch on the whole thing, from the ground up.

The General Board should determine all naval policies, and when any of these policies have been approved by the Chief of Operations and the Secretary of the Navy, they should then be taken up by the Plans Division of Operations and worked out in as much detail as the information available and the conditions of the problem will permit.

In other words, the General Board under this arrangement would be a policy board. The plans board would take those general policies and work them out into the detailed administrative and operative plans.

The war plans will show the fleet, its organization, personnel, and bases required. This is shown on this blue print. From this information the bureaus concerned can readily determine their requirements for new construction, maintenance, additions to personnel, etc., to enable them to carry out their part of the plan. This same information will enable each of the bureaus to make up its estimates. By adding to the sum of the above estimates, the administrative expenses, we have the annual budget for the whole Navy, obtained in the same way that we now obtain the aeronautical budget, and it would then be handled as is the aeronautical budget; that is, by allocation by the Secretary of the Navy to the various bureaus of sufficient funds to enable them to meet their part in the military plans.

In this connection the committee's attention is called to the great advantages of the aeronautical budget which has enabled us to change expenditures as the changed conditions demanded, without going back to Congress for permission to apply it somewhere else. It was extremely valuable, of course, in aviation, which was changing

so rapidly, because when we asked Congress for an appropriation for a particular thing, that thing was out of fashion, often, before we got the money at all.

Now, as to the strategy of the World War from the American point of view, the World War, in so far as the United States is concerned, was like every other war overseas, which required the cooperation of the Navy and Army. In the ordinary course of such a war, the Navy first clears the sea routes, seizes the landing places, then transports the troops and their supplies to the seized port or base, and thereafter its functions consist of keeping the lines of communication open and secure, and on the completion of the war, it returns the invading Army to the home country.

The other function of the Navy in such a war is to cut the lines of sea communication of the enemy, prevent his obtaining reinforcements and supplies from overseas, and also in blockading his ports to prevent allies or neutrals from furnishing the enemy munitions or other supplies.

The Army's function after landing is to defeat the enemy by defeating his armies and overrunning his country and compelling the population to submit to its will.

In this war, our allies had cleared the seas of enemy trade, had blockaded his ports and were in absolute control of the sea, except for enemy submarines, so that on our entering the war, our major and primary mission was to transport enough troops with their munitions and supplies to France to turn the war on the western front in favor of the Allies. We did this successfully in spite of submarines and without the loss of a single life by the enemy submarines on the way to war.

Prior to our undertaking the transfer of our Army to France, the largest troop movement in history for any distance had been the movement of about 200,000 troops from England to Cape Town in the South African War. This was considered a remarkable success, although there was no resistance to the movement at sea, other than the natural difficulties of sea transport. The movement extended over about the same time that our troop movement covered, and I think I am safe in stating that no officer of any Army or in any Navy would have believed that we, or any other nation, could possibly have moved 2,100,000 soldiers 3,000 miles at sea in the face of enemy submarine activities without serious losses, and I for one am perfectly willing to confess that I feared such losses.

I do not think that any undertaking in the whole of the World War was of greater magnitude or of greater difficulty, nor do I believe that any of the number of various successful undertakings of the war was more successfully and efficiently carried out than this unprecedented movement to France, and equally unprecedented, so far as numbers are concerned, return of troops from France. This only could and did succeed through the heartiest cooperation of the Army and Navy, and the credit is equally due to both. It is a fifty-fifty proposition.

Our secondary mission, secondary in magnitude and importance, simultaneous as to time, was the suppression or control of the submarine menace, so as to reduce it below the point where it could prevent adequate supplies of troops, food, munitions, and fuel reach-

ing the ports of our allies. That is as far as it was necessary to control or reduce it.

Our part in the suppression or control of the submarine menace was comparatively small, commencing three years after the World War had opened with the arrival of our six destroyers in Queenstown on May 4, 1917, one month after the declaration of war.

There has been a great to-do about our alleged delay in entering whole-heartedly into the war and sending immediately all our anti-submarine and other forces, even including battleships, overseas. As previously explained in this paper, there were many good and, to me, sufficient reasons why the immediate sending of all craft that afterwards were sent was a physical impossibility, and here I wish to state that in my opinion the stripping of our coast of all of its defensive vessels in the first weeks of the war, when we had a perfect right to expect from the demonstration already made by the German that he would send submarines to our coast to break up at their origin off our ports our supplies of food, munitions, and troops, and while there has been a great to-do about the war all being "over there," the submarine menace was all "over there." It could very readily and very profitably, in my opinion, have been made "over here." As a raid, I mean. Imagine the result in the early stages had the three submarines that came in 1918 arrived off our ports of New York and Capes of Virginia in April, 1917. Public opinion and the Congress, I fear, would not have permitted us, had we so desired, to strip the coast, and in my opinion such an attack at that time would have so upset our plans that we would not have been able to organize a sufficient convoy force for our troops; that is, early in the war would not have been able to send any patrol ships abroad, as we did later, and the placing of 2,100,000 soldiers in France with 600,000 of them at the fighting front when the armistice was signed would have been made impossible for at least a year after it was actually done as we worked it out.

It is my opinion that the retaining of the patrol force on our own coast, the organizing of our harbor defenses, mines, nets, etc., was an absolutely correct military step of itself, on the principle that you organize the defense before you launch the offense; and besides, this permitted us to repair, equip, and dispatch different groups and different units in much better condition and much readier for effective service than would any of these units have been had we attempted to send them by telegraph, as seems to have been suggested in Admiral Sims's testimony.

It is further my opinion that the method pursued was absolutely the correct one; that there was no delay which could be avoided in the repair and equipment of the vessels sent; that there was no delay that could be avoided in building additional vessels of the destroyer type; that there was no delay that could be avoided in the purchase and conversion of the yachts, the equipment of the Coast Guard vessels, or the building, training, and assignment of submarine chasers. I believe the Navy Department in this respect did the absolutely correct thing from the military point of view, and that it should be complimented instead of cursed for the way it did it.

As to the effect of a submarine attack on our coast, attention is called to what actually happened in 1918 and the difficulties we had to avoid a congressional resolution directing the executive authorities

to retain more forces on our coast. As to conditions then, see Senator Lodge's statement of June 6, contained in Annual Report of the Secretary of the Navy for the fiscal year ending December 1, 1918, pages 3, 4, and 5.

To sum up the strategy of war, the Central Powers could win either on western front or on the sea through the success of the submarine in shutting off the supplies from England long enough to starve her population into submission.

The Allies could lose the war either on the western front or on the sea through the submarine menace.

The submarine menace, unless fully effective in reducing tonnage and supplies to the necessary minimum to feed the English population and English Army, or fully effective in preventing the movement of our troops across the seas, should not have any real effect on the war or the date of its conclusion, and it failed utterly, in my opinion, to affect the war in favor of the Central Powers or against the Allies. It could have been, to be a success at all, a complete success. Instead, it was a complete failure.

The Allies could win the war in only one place, and that was on the western front, and they could only win there by our successfully supplying troops in large numbers, trained and equipped, ready to take their place on the fighting line.

As everyone knows, we so succeeded in the movement of our troops that the armistice was signed on November 11, 1918, when the Supreme Allied War Council had not expected to completely defeat the enemy before the spring of 1919.

Attention is called to the statement of Gen. Bliss as to quotations from Gen. Haig. That is in the letter submitted to the committee, where he did not expect the American forces to take any less time in training than was given his troops, that is, nine months in England and five months in France. He said, "On that basis, the American force will not be available in the front lines in force until next year," meaning 1919.

Therefore, from this point of view, instead of our having delayed the close of the war by four months, or any other length of time, we through the efforts of our Army and Navy, in advancing the date of the arrival in France of sufficient troops to defeat the Hun, had advanced the date of the close of the war from, say, May 1, 1919, to November 11, 1918, or a period of about five and one-half months. Or to use the absurd figures used by Admiral Sims, we saved 3,000,000 tons of shipping, \$18,700,000, and 625,000 lives.

This estimate of time is conjectural, but no more so than that of Admiral Sims's four months' delay, and is based on correct premises and on what actually happened and not on incorrect premises and statements as to what anyone thinks might have happened.

Now, as to the statement as to Admiral Sims's duties in London, Admiral Sims complains frequently and bitterly of lack of assistance in doing his job. From my knowledge of Sims's duties, as they were understood in the department, he was, at first, looking for complete information as to the situation in general, and as to how we could best assist the Allies, as an agent of the Chief of Naval Operations, and later became liaison officer with the British Admiralty. He was on the ground to send us fuller information than we had been able to get

for ourselves, because the Allies were not willing to give us real inside dope before we went into the war.

To aid him in this duty, all naval attachés in Europe were placed under him, sent all their information through him, and he himself was finally made attaché in London at his own request. Thus in information gathering he had quite a little assistance, other than his aid.

There is no doubt that Admiral Sims should have had additional assistance; much more than he had, as his duties expanded, but likewise, there is no doubt that we were all short handed, in Washington, in the fleet, and in the districts as well as in London.

Operations appreciated Admiral Sims's need for assistance. The committee should note that, shortly after Admiral Benson's arrival in London—when he sent battleships, and the duties were extended—Capt. Schofield, head of the Plans Section in the Office of Operations, was sent to London, and that at various times Capts. McNamee, Knox, Sexton, and others were sent to help out, and every one of those officers was badly needed in the main office here, on the same kind of work, at home, and their absence increased the load, already heavy, that each of us was carrying. This load killed our best man, others broke down from time to time and had to be given a rest, but I never heard one of them squeal.

It is my opinion that Admiral Sims himself was responsible for a part of the difficulties of which he complains, in that he assumed broader functions and reached for higher powers than it was intended he should have.

He was liaison officer; he was attaché; he did have the title and duties of the office "Commanding United States Naval Forces in European Waters"; he was our representative on the Allied Naval Council (which met monthly or as was deemed advisable). All of these summed up and each given its proper limit can best be expressed by one title, "Assistant Chief of Naval Operations with Office in London." That is what he was and that is all that he was.

Had he so limited his functions as to bring them all within this title, he would not have gotten the erroneous impression that he now apparently holds; that is, that the Navy Department should have become a rubber stamp to register and file his decisions. What Operations wanted was his recommendations with his reasons for making them; upon receipt of these recommendations and reasons, Operations would, after giving full consideration to the policies of the State Department, the necessities of the War Department, the condition of our industries, of our sea tonnage, of the Allies' food supplies, of our fuel supplies, of our transportation and labor here at home, make its decision and leave the execution to him, which was his job. This was absolutely necessary as Admiral Sims could not know and did not know about home conditions as shown by his testimony about the draft, etc. Further, it was not his business to know.

In his testimony he suggests that all allied appeals for help, which were made to the department should have been made to him. How ludicrous this is when one knows that these appeals here in Washington from special missions in reference to almost every industrial product known to our country, became so numerous that in self-protection we had to have the Allies appoint an allied council

to whom these various claims were presented, and the joint demands were then pooled, arranged, in the order of their importance, presented by the allied council to our War Industries Board before they could be considered. And this allied council eliminated immense numbers of the unessentials, and they made an entire change when they pooled all interests. Before that the Britishers watched the French and the Frenchmen watched the Italians and the Italians watched the Britishers and the French, and they were competitors in a limited market; and we had to watch all the time, ourselves.

The various departments, including the Navy Department, declined in many of these cases to even act as special attorney for a sister service before the War Industries Board on these matters. To have even considered them in London would, with the lack of information as to home conditions, have been ridiculous, and would have led to no result, except confusion and disappointment.

The volume of business done in this connection by the Office of Operations with the various other departments, State, War, Labor, Commerce, and Shipping Board, was such as to require numbers of private wires for direct and confidential communication and a record of the messages exchanged with these various departments would compare in bulk even with the voluminous correspondence from Admiral Sims, although I hope it would not contain so many unnecessary repetitions.

To sum up, it was and is my opinion that Admiral Sims was given as free a hand within his proper area of discretion as the conditions permitted, and as was necessary for him to successfully perform his various duties. His admirable performance of the job is the best evidence that can possibly be produced before the committee that he had the necessary authority to meet his proper responsibilities.

The CHAIRMAN. Is that all of your statement, Admiral?

Admiral McKEAN. That is all of my direct statement.

The CHAIRMAN. I stated some time ago, Admiral, that the committee would ask you to submit suggestions for changes that might be necessary or advisable in the organization of the department, and you have to-day outlined a plan.

Admiral McKEAN. Yes, sir.

The CHAIRMAN. And you have no further suggestions to make in regard to that?

Admiral McKEAN. I have a definite, rough—or rather hurried; it is not rough—suggestion as to the legislation necessary to reach the conclusion.

The CHAIRMAN. Is that included in this paper you have offered?

Admiral McKEAN. That is in that annex.

The CHAIRMAN. Then that is in the record with that plan?

Admiral McKEAN. Yes, sir; and the recommendations for new legislation is already attached. That is just simply a personal suggestion. That is mine. That, I think, will cover that line.

The CHAIRMAN. The committee will adjourn until to-morrow morning at 10 o'clock.

(Thereupon, at 1 o'clock p. m., the subcommittee adjourned until to-morrow, Friday, April 30, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

FRIDAY, APRIL 30, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met pursuant to adjournment in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale, presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

TESTIMONY OF REAR ADMIRAL JOSIAH S. McKEAN—Resumed.

The CHAIRMAN. The committee will come to order. Admiral McKean, before the outbreak of war with Germany on April 6, 1917, were you provided with any general plan by the department to govern your action in getting the material of the Navy ready?

Admiral McKEAN. I was. The general plan of the General Board. We were all familiar with it. It consisted of the A fleet, the base fleet; the B fleet, that came next; and the C fleet, the war fleet. And, as I understood the plan, and my job, it was to prepare bases of supplies and to prepare facilities, etc., to build up the C fleet and to maintain it in war.

The CHAIRMAN. Was this a special plan for the war with Germany?

Admiral McKEAN. It was what we called the Black plan. We never spoke of Germany, but we called it the Black plan.

The CHAIRMAN. When was it developed?

Admiral McKEAN. My recollection is that the first Black plan was developed in 1913 and revised in 1915, and revised to suit the conditions of the World War as we understood it before going into it, and with the information we then had under that plan of February, 1917. The plan of February, 1917, was the last plan.

The CHAIRMAN. Is that the plan that Admiral Niblack—I think it was—referred to as having existed from time immemorial in the department?

Admiral McKEAN. I did not understand Admiral Niblack to say this particular plan had existed from time immemorial. I understood him to say that plans had existed from time immemorial; that is, at all stages of the development of the Navy there was somebody somewhere in the department that was supposed to have a plan for what might be done. I never knew of any plans in any branch of the Navy Department until the General Board built up general plans and made studies of bases and lines of operations, etc., for use in possible war against either black, red, or orange.

The CHAIRMAN. Could you give us this base plan to which you refer, as it existed on February 2, 1917?

Admiral McKEAN. Could I give what?

The CHAIRMAN. Could you give the committee a copy of this plan as it existed at that time?

Admiral McKEAN. I think the General Board's plan—I do not know whether the ship's names, etc., were put in, but I think we can get it from the General Board, unless Admiral Badger put it in. He put in the policy upon which the plan was based. It is not a definite, worked out, detailed plan. It gave the policy and it gave the fleets, the A, B, and C fleets, and their constitution and numbers and types.

The CHAIRMAN. But you say it was prepared with reference to this special war?

Admiral McKEAN. Oh, no. The one between February 4 and February 17, based on Capt. Chase's letter to the General Board, or sent by the Secretary, prepared by Capt. Chase, and the plan returned, I think as of date February 17—was it not, that letter of the General Board returning that?

Capt. PRATT. Yes.

Admiral McKEAN (continuing). That is the lost plan.

The CHAIRMAN. But if there was such a plan, why was there any need of writing about any further plan?

Admiral McKEAN. That was the plan at that time, a plan for general war; or, rather, a special war in which we were engaged against Germany alone. The plan of February, 1917, was a plan to suit the conditions when we had allies, and the submarine menace was the primary naval motive.

The CHAIRMAN. But you said that the plan was kept up-to-date. Was it not known before February, 1917, that if we went into the war we would have allies against Germany?

Admiral McKEAN. Well, if we went in against Germany before Germany succeeded in stalemating the others; yes.

The CHAIRMAN. And yet no plan was ready at that time for such an event?

Admiral McKEAN. I do not think there was a detailed plan for the special conditions; no. I never saw one. We worked up the details of the plan as the situation developed, and that was the only practical way, in my opinion, Mr. Chairman, of doing it.

The CHAIRMAN. You can give us the plan, can you, as it existed on February 2, 1917, for the record?

Admiral McKEAN. Yes; I will get that out of the files of the General Board.

The CHAIRMAN. And then you will also give the plan as supplemented at any time between February 2 and April 6, 1917?

Admiral McKEAN. I can not do that, because the only copy of that plan is the lost one.

The CHAIRMAN. Then it was not supplemented?

Admiral McKEAN. It was supplemented by the plans that Capt. Pratt submitted here—sectional plans.

The CHAIRMAN. But those are simply memoranda. They are not parts of the plan.

Admiral McKEAN. They are distinctly parts of the plan, made to carry it out.

The CHAIRMAN. Were they embodied in the plan?

Admiral McKEAN. We did not have time to stop and write things into plans, Senator. We were operating. They were carried out.

The CHAIRMAN. I think Capt. Pratt testified that those were simply memoranda, and that they were carried out later on, at later periods, some after the war commenced and some not carried out at all?

Admiral McKEAN. Yes.

The CHAIRMAN. What I want is something definite that we can show as an existing plan.

Admiral McKEAN. Your General Board's general plan is the foundation of these memorandums. I do not know there were other memoranda.

The CHAIRMAN. You would not say that simply making memoranda kept the general plan up to date, would you?

Admiral McKEAN. If it was circulated with authority to the subdivisions which carried out the plans, the O. K. on that was an executive order for each of us subordinates to prepare our part of it.

The CHAIRMAN. It was just as much a plan as the other was?

Admiral McKEAN. Yes, sir.

The CHAIRMAN. But in many cases there were no particular O. K's on these memoranda.

Admiral McKEAN. If they were not O. K'd either in writing or orally, that did not become a part of the approved plan of the office, before Capt. Pratt came in, and after Capt. Pratt came in as the assistant for operations, Chase and I, working together—he would pass a plan or a part of a plan over to me orally, and we would discuss it, and discuss it sometimes with our chief, and if it needed the Secretary's approval he would take it up with the Secretary. But it was often, as I say, disposed of orally, and they would say "Go ahead and furnish the material at such and such a date."

The CHAIRMAN. But as I understand, a general plan is a plan that the whole department is supposed to operate under, and you can not say that the department can operate under a plan some parts of which are written out and some parts of which are in the form of memoranda that only one or two know about.

Admiral McKEAN. There were plenty of things we did not want but one or two to know about. I could get my people, the material side going, and Chase could get the operating end, whichever it should be, going, when the chief gave us a force. We did not have to put it on paper always, or have to have it approved always. We started ahead. We shot lots of plans, parts of them, out to the yards and other people; and it was just as much a plan, Senator, as if it had been written down and published by the Public Printer.

The CHAIRMAN. It may have been a plan for the people who knew about this specific condition; but for the rest of the Navy, it certainly could not have been.

Admiral McKEAN. The rest of the Navy did not need to know it; only those who had to do with it. For instance, the people in London did not have to know about a base plan.

The CHAIRMAN. You are talking now about a general base plan for the Navy.

Admiral McKEAN. No, sir; I am talking about a general base plan, the General Board's plan. The details of that plan were no part of the Navy's—

The CHAIRMAN. But you said that the general base plan included amendments that were made from time to time.

Admiral McKEAN. It does. They amended it and changed it and developed it. But it does not of necessity, Senator, go to everybody. It is not everybody's business, lots of it.

The CHAIRMAN. You can not give us this general base plan as amended?

Admiral McKEAN. Impossible; there is no such thing in existence; no such thing in existence.

The CHAIRMAN. It does not seem to me to be a very specific plan.

Admiral McKEAN. It was as specific and complete in details as was necessary for the officers concerned to operate under effectively and efficiently, in my opinion.

The CHAIRMAN. Were you informed of the kind of service for which the American naval vessels would be used in the war before April 6, 1917?

Admiral McKEAN. Do you mean informed by higher authority?

The CHAIRMAN. Informed by the department.

Admiral McKEAN. I was one of the people who determined how they should be used. I did not have to have anybody tell me.

The CHAIRMAN. Did the base plan lay out the manner in which these vessels should be used?

Admiral McKEAN. Not in detail, no, sir; but I knew what vessels I was called upon to get ready materially for use overseas or for use at home and for use otherwise.

The CHAIRMAN. And thereafter to this you would add a specific plan for the use of all the ships of the Navy at that time?

Admiral McKEAN. Do you mean by a specific plan, something reduced down on paper?

The CHAIRMAN. Something in writing?

Admiral McKEAN. I did not, but I had it in my head, and I was working on it every day.

The CHAIRMAN. But you had nothing that was written out?

Admiral McKEAN. Oh, yes, sir. There were these material policies, Capt. Pratt's memoranda, Capt. Chase's memoranda, and discussions and conferences with my chief, and conference with all of us. I got my instructions as to what to do.

The CHAIRMAN. That is, there were a lot of ideas and a lot of memoranda, but undigested?

Admiral McKEAN. We did not have to write them down in order to digest them. We digested them at the time and got action. We would have a discussion as to a certain part of the plans, and they would say, "What will that require in material," and I would ask the question, "What is it you want in the material way and when do you want it; what type of ships?" and so forth. Then they would say, "We will need so many destroyers, so many patrol boats, and so many of this, that, and the other."

The CHAIRMAN. And they would let you know just what they would be used for?

Admiral McKEAN. Yes. I knew.

The CHAIRMAN. All of the vessels required?

Admiral McKEAN. What is that?

The CHAIRMAN. You knew what all the vessels required would probably be used for?

Admiral McKEAN. I knew that, too; but we shifted from week end to week end, as the ships became available. I worked out the types I could get quickest and get ready to send out on the order; but I did not stop to write out plans or to make anybody else do it. I made instructions for my subordinates and sent the orders by telephone, by cable, or by telegraph, whichever way I could get it to them quickest.

The CHAIRMAN. Upon what information and instructions did you base your action with regard to improving the matériel condition of our naval vessels?

Admiral McKEAN. What is that, sir?

The CHAIRMAN. Upon what information and instructions did you base your action with regard to improving the matériel condition of American naval vessels?

Admiral McKEAN. Of improving?

The CHAIRMAN. Yes; prior to the war.

Admiral McKEAN. On my knowledge of what each type of vessel was intended for and fitted for, and how we could best fit her in the shortest time at the least expense for that job, and knowing from the discussions and from the plans what job came next and where we could use it.

The CHAIRMAN. And you received instructions from the head of the department?

Admiral McKEAN. From the chief of operations.

The CHAIRMAN. From the chief of operations?

Admiral McKEAN. Yes, sir, or from the assistant chief, Chase, or Pratt, saying they wanted certain ships.

The CHAIRMAN. What were those instructions prior to the war?

Admiral McKEAN. Oh, that was a general instruction prior to the war.

The CHAIRMAN. What were those instructions?

Admiral McKEAN. To get everything ready as fast as you can.

The CHAIRMAN. The general instructions were to get everything ready as fast as you could?

Admiral McKEAN. Yes, sir.

The CHAIRMAN. When did you receive that?

Admiral McKEAN. I was moving from July 1, 1915, when I went in there, along those lines, as I showed in these policy letters.

The CHAIRMAN. Did you receive instructions on July 1, 1915, or shortly thereafter, to get everything ready?

Admiral McKEAN. That was my chief's instruction.

The CHAIRMAN. To get everything ready for war?

Admiral McKEAN. That was the position of the whole Navy Department, to get them ready for war. That was the purpose of the Navy Department. We started just as soon as the office was organized. We worked right along. Of course, as our chances of getting into the war became more and more pressing, we each of us felt more and more urgent on the question.

The CHAIRMAN. Well, there could not be very much more urgent instructions, could there, than to get every vessel ready for war? And that, you say, you got in 1915.

Admiral McKEAN. We attempt to keep every vessel ready for war at all times. That is the only use we have for a naval vessel.

The CHAIRMAN. You mean that is July 1, 1915?

Admiral McKEAN. That was the general policy. I do not know about the practice.

The CHAIRMAN. So that there was not any special instruction?

Admiral McKEAN. It was not necessary. I was in touch every day with the Secretary and with the Chief of Operations.

The CHAIRMAN. But every vessel was not gotten ready for war, was it?

Admiral McKEAN. Absolutely not, no, sir. I am very sorry to say that they were not.

The CHAIRMAN. Did you receive any definite instructions to prepare the light forces of the Navy for distant service?

Admiral McKEAN. The light forces of the Navy? Gunboats, you mean, and so forth—destroyers?

The CHAIRMAN. Gunboats, cruisers, and destroyers.

Admiral McKEAN. Not special instructions, until they commenced to pick out groups: "Get 12 submarines ready;" "Get 6 destroyers;" "Get so many destroyers, right away. See which ones you can pick out and get the quickest. We would like to send such and such a group at such and such a date."

The CHAIRMAN. That, however, was after the war began, was it not?

Admiral McKEAN. I do not think there were any special instructions as to special vessels before the war broke out, but under the general instructions I was doing exactly as I did after I got my special instructions. I was doing the best I could with the material I had to get them all ready.

The CHAIRMAN. I asked you if you had any definite instructions to prepare the light forces of the Navy for distant service?

Admiral McKEAN. Not until after the war.

The CHAIRMAN. Not until after the war?

Admiral McKEAN. No, sir; no special instructions.

The CHAIRMAN. When did you first receive such instructions?

Admiral McKEAN. I do not recollect.

The CHAIRMAN. Was it in regard to the six destroyers that were sent over?

Admiral McKEAN. I think it was the first special order or group, was to get six destroyers ready. But still, we were working on that before, Senator.

The CHAIRMAN. But you received no particular instructions to do it?

Admiral McKEAN. No, sir; no special, detailed instructions.

The CHAIRMAN. And thereafter you received further special instructions about other destroyers that were decided on to go over, did you?

Admiral McKEAN. Often they would ask me how soon I could have a bunch, and when they would go. It hinged often on the material conditions when they would go. I would pick out the ones from the yards that I could get ready quickest to make a uniform group. I would tell the operating end, "I can give you such and such destroyers on such and such a date, and have them at such and such a place." They would say, "All right; we will send those abroad." We tried to send them by divisions—groups of six.

Here I would like to explain what does look as if there might have been neglect. There are practically 46 oil-burning destroyers—23 with the fleet and 23 on other duty.

Senator KEYES. When?

Admiral McKEAN. On April 6. It appears, just to a casual observer, that 23 destroyers not with the fleet and not in condition to move overseas immediately was pretty bad management.

The CHAIRMAN. Especially after the order of January, 1915.

Admiral McKEAN. After what, sir?

The CHAIRMAN. After the order of January, 1915, to get the fleet ready in every possible way.

Admiral McKEAN. That was July, 1915.

The CHAIRMAN. July, 1915; yes.

Admiral McKEAN. A number of our destroyers, the new destroyers, had defective units. Some types had defective machinery, giving us a lot of trouble; some of those turbines. Some of them were not finally accepted, and the contractors had to make good on them. These were not sent with the fleet. They were kept at home, and they were being used on neutrality duty at the ports, protecting our neutrality, escorting neutral vessels in and out, or belligerents, and protecting our neutrality; so that I could not get hold of them for repairs. They would send them to the yards for a very short time.

The CHAIRMAN. Were they afterwards repaired?

Admiral McKEAN. Yes, sir.

The CHAIRMAN. And put in foreign service?

Admiral McKEAN. Yes, sir.

The CHAIRMAN. And the faults in their construction, et cetera, were known before, were they?

Admiral McKEAN. Oh, we were trying to correct it all the time, but I could not get them at the yards for long periods, because they were on active duty. They were standing watch, and relieving each other, and they would take a turn-around in three or four days. I would have them available at the yards to do what I could do in three or four days. You can not take the machinery and engines down, take the machinery apart, and get it together again in three or four days, much less do repairs. So that we were caught in what was apparently a bad condition. But we were doing the best we could under the conditions, with the yards we had.

The CHAIRMAN. After our entry into the war were you given any general plan of operations to guide your activities?

Admiral McKEAN. I did not need any.

The CHAIRMAN. You were not given any general plan?

Admiral McKEAN. No, sir; I did not need any. I was working under general instructions.

The CHAIRMAN. Would you say that the Secretary of the Navy's report for 1918 was accurate when he stated that the Navy was ready from stem to stern?

Admiral McKEAN. I would have to ask the Secretary what he meant by that. I think that is a newspaper phrase used in the seaman's way, and you had better ask him just what he meant. I would not want to criticize him until I knew.

The CHAIRMAN. Would you say yourself that the Navy was ready from stem to stern?

Admiral McKEAN. From my interpretation of that phrase I would not, by a good deal.

The CHAIRMAN. After we had entered into the war did you receive any particular instructions about preparing the light forces for war service?

Admiral McKEAN. As I told you before, from time to time I would either get orders for a bunch, or they would ask me what I could give them, and which I could give them soonest; and we all worked right there together in the same office. We did not have to ask special instructions. We knew what we were trying to do, all of us.

The CHAIRMAN. How long did it take to get the destroyers, gunboats, submarines and other light craft in a condition of material readiness for war?

Admiral McKEAN. Some of them two days, some two months, and some of them six months.

The CHAIRMAN. How long was it before substantially all of them were in readiness for such war?

Admiral McKEAN. Those dates of sailings of the destroyers and those vessels that went over to the other side were in that table we submitted. I of course can not remember all those details.

The CHAIRMAN. The table gives the destroyers. I do not think the table gives the other boats.

Admiral McKEAN. It gives 139 that we had over in the first year.

The CHAIRMAN. You refer to those that were sent over to Admiral Sims?

Admiral McKEAN. Those that were sent over to the other side And in this large table here sent in reply to your inquiry I think that data is practically covered.

The CHAIRMAN. That simply refers to battleships, cruisers, and destroyers.

Admiral McKEAN. Battleships, cruisers, and destroyers. Well, your gunboats, etc.—

The CHAIRMAN. By the way, Admiral McKean, I would like to have the information, giving it in a list which you can supply, giving the same conditions about the other light forces of the Navy.

Admiral McKEAN. Will you please give me, Senator, just what light forces?

The CHAIRMAN. I would like to have the condition of all of the ships of the Navy on April 6, 1917.

Admiral McKEAN. You want the gunboats?

The CHAIRMAN. We already have the gunboats and battleships and destroyers. I would like to have the same information in regard to the other vessels of the Navy at that time.

Admiral McKEAN. Gunboats, yachts.

The CHAIRMAN. All of the vessels of the Navy at that time.

Admiral McKEAN. Very well, sir; I will get it from Operations.

The CHAIRMAN. Can you answer the question I asked you: How long did it take to get the destroyers, gunboats, submarines, and other light craft in a condition of material readiness for the war?

Admiral McKEAN. I could not answer definitely, ship by ship.

The CHAIRMAN. Then can you tell me at what period of the war these vessels were all in readiness for war?

Admiral McKEAN. Never, at any time; and never will be.

The CHAIRMAN. Substantially all in readiness for war?

Admiral McKEAN. Oh, I should say six months.

The CHAIRMAN. Six months?

Admiral McKEAN. Six months, in a general way. But of course there were ships breaking down and going back to the yards and wearing out. They would have to go for overhaul. I do not

think you can ever count, Senator, on more than 80 per cent of your battleships being with the fleet, and not over 75 per cent of your destroyers, and the smaller your craft the less the per cent of time they will be with the fleet—operating, I mean. And you can not operate submarines—I do not think the Germans operated submarines more than one-third of the time.

The CHAIRMAN. That is to say, even when a fleet is in active operation and prepared for war there are always certain vessels that are under repair?

Admiral McKEAN. Always. That is why under the old policy of the building program you built five ships when you wanted four in a division.

The CHAIRMAN. Did you have any difficulty in securing approval of your plans for building up the material of the Navy at any time?

Admiral McKEAN. Oh, yes, sir; I had certain minor difficulties. I had delays. I had to convince my chief first of the necessity of it. I sometimes had difficulty in convincing the Secretary when it involved money. I often had difficulty in presenting the thing to committees of Congress and getting the money, even after the Secretary had approved the estimate. But at no time did I have difficulty in getting a hearing. If I could prove my case, why, I could in time get action. It would not go as fast as I wanted it to. I would have liked to have had all the appropriations all at once.

The CHAIRMAN. Did you meet with any unnecessary delays in your dealings with the Chief of Operations or the Secretary?

Admiral McKEAN. Unnecessary?

The CHAIRMAN. What you regarded as unnecessary?

Admiral McKEAN. Oh, from my point of view any delay, after I was convinced, would be unnecessary, you know, Senator. From their point of view it would be necessary for them to consider it. I often got very, very impatient. But they were responsible, and not I. I was responsible for the recommendations. They were responsible for the decisions.

The CHAIRMAN. Did you meet with any delay that in view of what happened afterwards did not seem justifiable to you?

Admiral McKEAN. Oh, I could not cite examples. I think if they had accepted my recommendations as soon as made, and Congress had given me the money as soon as I wanted it, there is no doubt that we would have been better prepared on April 6, 1917; and with the hindsight, I have no doubt that the Secretary, when he did not agree with me right away, and the committees when they did not give me more than half as much money as I asked for, with the hindsight now, I suppose they are both regretting it. I regretted it at the time.

The CHAIRMAN. Did you find any trouble in getting appropriations from Congress after February 2?

Admiral McKEAN. I do not recall any after February 2. I think they gave us the first emergency appropriation then, and they told us to come and ask for what we wanted, and told us practically to spend what we wanted and they would make it good in deficiency bills; and after April 6 I never hesitated, if I could get the approval, at spending money—I knew I would get it somewhere—and committing the department to the policy of spending money. After war was declared, Senator, we had all the money that we could use.

The CHAIRMAN. Did Congress turn down any of the recommendations that you had made and that were indorsed by the Secretary, after the sinking of the *Lusitania*?

Admiral McKEAN. I have forgotten the date of the sinking of the *Lusitania*.

The CHAIRMAN. I think it was in May, 1915.

Admiral McKEAN. Well, it took me 18 months to get an appropriation for the operating base at Hampton Roads, after the Secretary had approved it.

The CHAIRMAN. Was it explained to Congress by the Secretary that those bases were vitally necessary for war?

Admiral McKEAN. After I convinced him, he backed me up and gave me letters to the committees of Congress, and gave me full swing to fight it out myself and prove to Congress that we needed it. He backed me clear to the limit, and it took me 18 months to get it.

The CHAIRMAN. Did he back you to the extent of informing Congress that in case of a war these matters were vitally necessary?

Admiral McKEAN. I do not remember that he used that language, but he backed me.

There was the same thing in reference to the Coco Solo base. It took me two sessions of Congress to get that, after I had the backing of the Secretary; and I do not think there was any bill, Senator, except one, on which we did not get cut down on our estimates. If we had asked Congress for the amount of money that was needed to develop those yards and bases and establish the aviation bases, etc., finally, in time of peace, we would have been laughed out of court. We would not have gotten a cent.

The CHAIRMAN. Do you think that if Congress had been informed that in case of a war we would be very much handicapped if we did not have these various things that you are asking for, they would have refused to grant you what you asked?

Admiral McKEAN. I do not think I hesitated to inform them what I thought about those things in the hearings, Senator, and they were cutting down, and they trimmed and delayed. I remember the Committee on Appropriations on the Coco Solo base, when I asked for a certain amount, cut it in two. I went back the next time and told them the price had gone up, and it would cost them for that half they had left out 50 per cent extra, because labor and material had gone up, and Mr. Fitzgerald turned to Mr. Sherley and said, 'You had better let him have it, Sherley, because he will keep on coming back until he gets it, and it will cost very much more.' They were not objecting, but I had not convinced them of the absolute military necessity of it. That is all I ever based a request for an appropriation on.

The CHAIRMAN. Do you not think that the department has gotten into the way of asking for rather more than it has expected to get, with the expectation of having its requests shaded down?

Admiral McKEAN. That runs back a long time, Senator. I think they used to, and other times I think they asked for less, because they kept—

The CHAIRMAN. I am referring to appropriations now.

Admiral McKEAN. Yes; they kept part of the responsibility themselves, because they were afraid to come to Congress with the whole thing. For instance, on building programs: I remember a discussion

at the War College in 1912. I said I thought it was about time we told Congress the truth, the whole truth, and nothing but the truth, and quit carrying a part of the burden of responsibility of the legislative body, and that we should make an estimate of the situation, of what we needed, never mind if it was 50 ships and we knew that Congress would not give it; that it was our duty as technical advisers to give them the whole program, and then we had washed our hands of the responsibility and put it upon the legislative body of the country, and if they did not want to fully prepare us, that was their responsibility and not ours any more after we had told them everything, if they would cut appropriations. They would say, "Congress will not give you that. What is the use of putting it in?" But sometimes there was an inclination, I think, on the part of certain people to ask for a little more to give the committees a chance to exercise economy in trimming down. But I think that has all gone out of fashion. I think that they give you a perfectly frank estimate based on the plans for the coming year. I know we tried to establish that.

In the hearings of last year before the House Naval Committee, when I was acting chief of operations, I took up the fleet as we would have liked to have it in commission, so many ships in full commission of each type, so many in reserve, and so forth, and the bureaus in turn took that same list. Navigation first said that it would require for this program so much personnel. Construction and Repair took it up and said it would require so much money for the new program, so much charge for maintenance, and so on. Steam Engineering did the same thing; made their estimates for engines, maintenance, and charges, and all based on this fleet that we planned to keep in commission and in reserve; and I think that in that hearing every bureau based its estimates and this year all the bureaus have based their estimates on the plan of Operations, and I believe that it is one of the best things that Operations has done. It has gotten it all together on the same plan.

The CHAIRMAN. You say that the Secretary was backing you to the limit in your requests?

Admiral McKEAN. On those particular things.

The CHAIRMAN. On those particular matters?

Admiral McKEAN. On those particular matters.

The CHAIRMAN. To prepare the country for the war?

Admiral McKEAN. Oh, I do not think that the Secretary or I ever said "Preparing the country for war."

The CHAIRMAN. I asked you if you put up to Congress that you needed this in case of war.

Admiral McKEAN. Oh, I always told them in the hearings that this was necessary for operations during the war.

The CHAIRMAN. And was the Secretary backing you up in that position?

Admiral McKEAN. I do not know as he used those phrases, but he said they were necessary.

The CHAIRMAN. Was he not at the same time giving out to the country his opinions that we would not get into war, and that the President was keeping us out of war and would keep us out of war?

Admiral McKEAN. I have forgotten all of those speeches.

The CHAIRMAN. I assume that if that was his position with the country it must necessarily have been his position with the committees.

Admiral McKEAN. There were a good many people who were thinking that at that time.

The CHAIRMAN. A good many, yes; unfortunately.

Were you given any indication as to what use should be made of the heavy forces of the Navy?

Admiral McKEAN. At what time?

The CHAIRMAN. Prior to our entry into the war, and immediately thereafter.

Admiral McKEAN. Well, Capt. Pratt told you that we had discussions as to the best use of the capital ships. There were two opinions. One was to use them exclusively for training, and move them to the Pacific. The final one was to keep them on this side ready for duty. I had not any particular instructions as to what duty they might do, but I knew, generally, and what was necessary in a material way, I was to get them ready to fight as fast as I could.

The CHAIRMAN. You were not given then any specific instructions about getting them ready?

Admiral McKEAN. No, sir.

The CHAIRMAN. When were you first informed of the possibility that the battleships might be sent abroad?

Admiral McKEAN. When was I first informed of the possibility?

The CHAIRMAN. Yes.

Admiral McKEAN. I do not know that I ever was informed, but I realized it all the time, that they might be called upon at any time for duty anywhere.

The CHAIRMAN. But you were not informed of any plan to send them abroad?

Admiral McKEAN. Oh, when they took up the sending of Rodman's division of five?

The CHAIRMAN. Whatever battleships were sent.

Admiral McKEAN. I was informed that we were to get those ships ready right away. I knew it as soon as Operation's decision. I knew it as soon as the decision was made. I was right there.

The CHAIRMAN. And that was the first plan that you heard of about sending the battleships abroad?

Admiral McKEAN. Oh, not the first plan.

The CHAIRMAN. Well, the first order to do something about it?

Admiral McKEAN. The first order; yes, sir.

The CHAIRMAN. What was the material condition of the dreadnought division at the end of July, 1917?

Admiral McKEAN. Of the dreadnought division?

The CHAIRMAN. Yes.

Admiral McKEAN. July, 1917. This table does not cover that. The *Wyoming* was not at the navy yard for overhaul after the 3d of February. The *Utah* was—

The CHAIRMAN. She was still in the navy yard until July.

Admiral McKEAN. The *Utah* was in the navy yard in July. She was there for nearly five months.

The CHAIRMAN. The *Wyoming* was back with the fleet then, was she?

Admiral McKEAN. The *Wyoming* was with the fleet. Her last day in the navy yard in 1917 was February 3. The *Texas* was out of

the yard at that time. She had her time there, but in July, 1917, she was out of the yard.

The CHAIRMAN. Was she in A-1 condition as to the material?

Admiral McKEAN. My recollection is that the *Texas* was in first-class condition until she ran ashore.

The *Pennsylvania* was in good condition. She was in 20 days; to June 20.

The CHAIRMAN. Admiral, I suggest that you prepare a list of the dreadnoughts at that time, at the end of July, 1917, and submit it to the committee.

Admiral McKEAN. Very good, sir.

The CHAIRMAN. And also accompanying vessels that were with the fleet at that time.

Admiral McKEAN. Well, that was all—the predreadnoughts.

The CHAIRMAN. The predreadnoughts were not with the dreadnought division, were they?

Admiral McKEAN. They operated from the same base.

The CHAIRMAN. Well, cut that out, and simply give the dreadnoughts at the end of July, 1917.

Admiral McKEAN. July 31, 1917. Aye, aye, sir.

The CHAIRMAN. And also give with it a list of the vessels that were in A-1 condition as to material at the time to go with the fleet.

Admiral McKEAN. Now, what do you mean by "A-1" condition?

The CHAIRMAN. Why, that were ready for war.

Admiral McKEAN. Ready for foreign service.

The CHAIRMAN. Ready for foreign service, yes.

Admiral McKEAN. I do not think there was a ship with the fleet that was not in the yard at that time that if you had asked her captain he would not have said she was ready for foreign service.

The CHAIRMAN. And you think they were so ready?

Admiral McKEAN. Most of them, yes, sir.

The CHAIRMAN. Do you think they were also ready as to personnel?

Admiral McKEAN. On July 1?

The CHAIRMAN. At the end of July, 1917.

Admiral McKEAN. At the end of July; yes.

The CHAIRMAN. All of the dreadnoughts?

Admiral McKEAN. Yes; they were not as efficient as they would have been, or as they were on the day they took the first armed guard crews out of them, because they had been used for training purposes.

The CHAIRMAN. That was sometime before the war?

Admiral McKEAN. That was in February; and that performance continued, you know; and they had been used for training. They were so used. Even the dreadnoughts were used for training up to February, 1918. I happen to know, because the training was stopped except for certain special forces, on the dreadnoughts, when I went to the *Arizona*, February 15, 1918. From that time on we had no training of armed guard crews or extra guns' crews. We only trained turrets' crews and oil-burning firemen for the ships of our type that were going to sea, the *Mississippi*, *Idaho*, and *New Mexico*.

The CHAIRMAN. When was the construction of the new destroyer program suggested?

Admiral McKEAN. When was it first suggested?

The CHAIRMAN. Yes.

Admiral McKEAN. My first suggestion—that is all I can speak for—I have a memorandum here of the rapid building of a large flotilla of destroyers, that has no date on it, but checking up—this is my own memorandum—I find it was about June 1, 1917.

The CHAIRMAN. Was it not suggested in April?

Admiral McKEAN. I have no doubt that there were discussions, and plans to produce, or calling for, a large number of destroyers. My memorandum was more on how to produce them from material point of view. But my recollection is that we all recognized the values of the destroyer as the final submarine killer as soon as we got the information from abroad, at all. I think we realized it, when we went into the war.

The CHAIRMAN. When was it approved?

Admiral McKEAN. Do you mean the big program?

The CHAIRMAN. What?

Admiral McKEAN. Do you mean the final, big program, or the first part of it?

The CHAIRMAN. I mean the construction program for destroyers—for new destroyers.

Admiral McKEAN. Here is the list in the hearings before the House committee. This is "Monday, December 30, 1918. Statement of the Hon. Josephus Daniels, Secretary of the Navy." This is page 870 of those hearings. Here is a list of the destroyers commencing with the *Gwynn*, No. 71. That gives the date authorized by Congress, the date of appropriation, the date of the order to the builder, and the per cent or date of completion. The *Gwynn* had been built up in the northwest, under the appropriation of March 3, 1915, or was building.

The next is destroyers Nos. 75 to 109, inclusive, and Nos. 345 to 359, inclusive; are building under the three-year building program of August 21, 1916.

The CHAIRMAN. I am asking you about a new destroyer program.

Admiral McKEAN. Yes; a new destroyer program. Do you mean after the war?

The CHAIRMAN. After the war began; yes.

Admiral McKEAN. Well, there were 15 destroyers, Nos. 95 to 109, inclusive, that were appropriated for March 4, 1917. That was before the war.

Fifteen destroyers, Nos. 345 to 359, inclusive, were appropriated for July 1, 1918.

Seventy-six destroyers are being built under the emergency fund in the act of March 4, 1917. That was allocated by the President.

One hundred and fifty destroyers, the big program, Nos. 186 to 385, inclusive, are building under appropriations for increase of the Navy, torpedo boat destroyers, in the naval deficiency bill of October 6, 1917.

The CHAIRMAN. But 75 were provided for by Congress on March 4?

Admiral McKEAN. Seventy-six.

The CHAIRMAN. Seventy-six?

Admiral McKEAN. Were built under that emergency fund in the act of March 4, 1917.

The CHAIRMAN. And the plans for them were approved in July, were they not?

Admiral McKEAN. March 4, 1917, is the date of the appropriation. As for the date of the order, some of them were ordered March 28, some May 17, some June 18, some July 15, and one August 7.

The CHAIRMAN. And the contracts were not let until December?

Admiral McKEAN. Oh, no, sir; here are the contracts—the dates of the orders. The contracts for those 76 were July 20, 1917, and the big bunch, 150, authorized October 6, 1917, commencing at No. 186, the bill appropriates October 6, 1917; the contracts or dates of orders were October 11, October 9, for three, October 11, October 11, October 9, October 15, October 9.

The CHAIRMAN. Was the construction of any of these destroyers started on before November, 1917?

Admiral McKEAN. The actual construction?

The CHAIRMAN. The actual construction?

Admiral McKEAN. I have here the ships under construction for the end of every quarter, all in type, commencing in January, 1917, and if you will tell me which particular destroyers you refer to—

The CHAIRMAN. When was the construction of the destroyers authorized March 4, 1917, actually begun?

Admiral McKEAN. That is Nos. 110 to 185, inclusive. The first time that 110 appears, the contract was let to the Union Iron Works, but nothing was done; but they appeared in the April 10, 1917, up to No. 118. The contract had evidently been let.

On July 10, 1917, contracts up to No. 135 had been let, and work was progressing on everything up to No. 118. That includes 8 of that 76 from Nos. 110 to 185. The first 8 of them were at the Cramp Shipyard, and the Union Iron Works, 3; the work was going on; had been started in the report of July 10, 1917. The next report is October 10. It gives the destroyers separately.

The CHAIRMAN. Were any of your destroyers that were in that list available during the war?

Admiral McKEAN. I do not think any of those—I can get that out of the ships' data book. I do not believe any of those were completed in time to be available during the war. These are Nos. 110 to 185 [after examining book] it is pretty hard to pick them out, they are so mixed up, Senator.

The CHAIRMAN. I think there were eight new destroyers that were actually used during the war.

Admiral McKEAN. How is that?

The CHAIRMAN. I think there were eight new destroyers that were actually used during the war, unless I am mistaken.

Admiral McKEAN. Were they of that program or of an earlier one?

The CHAIRMAN. They may have been earlier.

Admiral McKEAN. You see, they were built in bunches. That three-year building program gave us authority to build 20 right away. It gave us 15 the next year and 15 the next year. Then later it gave us the authority to build the whole of that program making a total of 50 available; but that was not until we got new authority. Then the 76 came along, and then 150.

The CHAIRMAN. You state that work was being done on these that were authorized, on March 4. Do you mean that their keels were being laid?

Admiral McKEAN. Oh, no sir. These figures give the assembling of material, etc. These figures are based on the contractor's returns

through the inspectors, showing what the contractors' percentage of pay is that is due. This is the percentage of total completion. They might have all the material assembled, and they got to doing that before the end of the war, not only assembled but cut, punched and built up into sections; and when the ways were clear they took and put the sections that they had riveted up, and up to the capacity of their crews, and then assembled them. They did not lay a keel, but they picked them up and put them in place and bolted them together and shoved them off.

The CHAIRMAN. Had the assembling been done on any of these boats until December?

Admiral McKEAN. December, 1917?

The CHAIRMAN. Yes.

Admiral McKEAN. On any of these boats?

The CHAIRMAN. Yes.

Admiral McKEAN. I doubt it. I do not think they had gotten up to that speed of construction at that time.

The CHAIRMAN. We spent about \$500,000,000 on destroyers during the war, did we not?

Admiral McKEAN. We built a total, yes; I should say of about that. The total cost established, when completed at war prices, may be a little more.

The CHAIRMAN. And can you tell me how many were in use during the war, of the new ones?

Admiral McKEAN. No, sir; I can not, now. I could not give you those figures.

The CHAIRMAN. Was everything done during the first few months of the war to place all the light craft of the Navy in such condition that they could be sent abroad immediately?

Admiral McKEAN. Yes, sir; within my capacity as assistant for material, and the capacity of the bureaus to furnish material, and the capacity of the yards to do the work.

The CHAIRMAN. Did we have any other ships available that could have been sent over to take the places of any of the 139 that were sent over to Admiral Sims, available on April 6?

Admiral McKEAN. On April 6 there were in the patrol force certain ships, but most of them later got over and were included in the 139.

The CHAIRMAN. I asked you if there were any others besides those that went over in the 139 that could have been sent over on April 6?

Admiral McKEAN. The *Dolphin*, that was down at Key West, as I recollect it, the flagship of the patrol to protect fuel oil, I think, at that time. I have forgotten.

There was a possible vessel here in Washington, the President's yacht, the *Mayflower*, that might have been sent. I do not think she should have been.

The CHAIRMAN. Then you do not know of any other ships, except included in that?

Admiral McKEAN. I do not know of any others now; no, sir. I think we sent everything as fast as it was materially ready and the military program would permit of its going; and by the end of the year I think we had everything that we thought could go or would be of any use over there. That was the intent as I understood it.

The CHAIRMAN. How long does it take to construct a seagoing tug?

Admiral McKEAN. I suppose there are some tugs in existence, Senator, that have taken as much as three years to construct. I suppose that there are wooden seagoing tugs that have been built in three months.

The CHAIRMAN. Three months?

Admiral McKEAN. I would not give much for the three months' tug, and I think that we could, under normal conditions of labor and material, etc., probably build a good seagoing tug in six months, and under war pressure, if we had had the material, we could have built in that time one, or a few, in less time; not many.

The CHAIRMAN. In less than six months?

Admiral McKEAN. Yes; not many, because we could not get the material. It was already mortgaged or claimed. Priorities would run against it. You would have had to hunt a hole which was not occupied in which to build it in the first place. Then you would have had to steal the material from some other purpose. You would have had to get the labor and fuel for it, and transportation and everything through the priorities board, before you could undertake it. We filled up all yards—and the Shipping Board—with tug orders and trawler orders and mine-sweeper orders, and we were just as urgent as we could be to get them through. Some yards did very well and some fell down entirely—failed entirely. It was luck if you got them in even normal time with war pressure.

The CHAIRMAN. And we were more likely not to get them at all?

Admiral McKEAN. There were tugs enough ordered by the Navy Department and the Shipping Board that when the armistice came we canceled half of our orders because they had not even had the ways to start them on, and we would pay for the material and some of the work and cancel them. We did not need that many. The Shipping Board canceled a great many more than we did. But as to the wooden tugs built in a rush out of green timber, all you have got to do is to look at the wooden ships built by the Shipping Board.

The CHAIRMAN. But if it had been an emergency case and the department had bent its every energy to have tugs built, they could have built and sent a number of tugs over in six months, could they not?

Admiral McKEAN. It was an emergency case; it was so treated; and we did not succeed in building the tugs in six months.

The CHAIRMAN. And when did you order them?

Admiral McKEAN. We did not have anything but emergency, Senator.

The CHAIRMAN. That may be true.

Admiral McKEAN. But there were so many emergencies. Sea-going tugs authorized by Congress October 6, 1917, from the emergency fund. That was the date of the appropriation. Date ordered, April 17, 1918; three and six. The rest of the 24 were ordered May 18.

The CHAIRMAN. 1917?

Admiral McKEAN. 1918. That appropriation was not available until October 6, 1917.

The CHAIRMAN. But, as you said before, appropriations would have been immediately available if asked for, for any purpose.

Admiral McKEAN. This was an emergency fund this was taken from. You could not authorize building without having some fund to put it in.

The CHAIRMAN. This was taken from emergency funds?

Admiral McKEAN. From the emergency fund of October 6, 1917; yes, sir. We usually had every emergency fund overspent by the time that it was deposited to our credit in the Treasury Department.

The CHAIRMAN. So that you really could go ahead without having the emergency fund on hand?

Admiral McKEAN. Not for new construction—a new program, in fact. They would not feel justified in doing that.

The CHAIRMAN. But you would have gotten it at any time? Congress was in session and ready to follow any recommendation?

Admiral McKEAN. I think that Congress was doing business pretty fast. They were perfectly willing to do anything I knew of.

The CHAIRMAN. Now, I have a great number of questions that I want to ask you, and I do not want to shut off any information you can give the committee, but if you will make your answers as brief as possible, Admiral, I would like to get through this morning.

Admiral McKEAN. I will try to; yes, sir. I want to get through.

The CHAIRMAN. What information did you have as to the situation abroad immediately after the outbreak of war?

Admiral McKEAN. Immediately after?

The CHAIRMAN. Yes.

Admiral McKEAN. It has all been testified to here. The first information we got from the British Admiral and the French Admiral. That came to me second hand through my superiors. I was not present at the conference.

The next information we got was Admiral Sims's cable and followed by his letter. Of course, we were getting such information as our attachés could acquire, but they were not getting much except what the press had.

The CHAIRMAN. Your principal information was through Admiral Sims?

Admiral McKEAN. After he got over there; yes, sir.

The CHAIRMAN. After he got over there?

Admiral McKEAN. That is what we sent him for.

The CHAIRMAN. And were you informed of his recommendations and requests as soon as made?

Admiral McKEAN. I saw all of the official correspondence sent to the department. It was referred around to the heads of the divisions.

The CHAIRMAN. Practically as soon as it was received?

Admiral McKEAN. I think so.

The CHAIRMAN. What instructions were you given, if any, concerning compliance with these recommendations or requests?

Admiral McKEAN. Compliance with them?

The CHAIRMAN. Yes.

Admiral McKEAN. Why, it was to make every effort to meet the different ones that they decided they would approve, as soon as possible.

The CHAIRMAN. After they had decided to approve them?

Admiral McKEAN. Yes; after the suggested scheme was approved.

The CHAIRMAN. By the——

Admiral McKEAN. By the Chief of Operations.

The CHAIRMAN. The Chief of Operations and the Secretary?

Admiral McKEAN. And the Secretary. Sometimes only by the Chief of Operations.

The CHAIRMAN. But they were not given out to the department until so approved?

Admiral McKEAN. No; they were circulated in Operations for our information.

The CHAIRMAN. Oh, they were, before they were approved?

Admiral McKEAN. Yes; for information. Lots of them were typewritten and sent about for information.

The CHAIRMAN. And discussed before approval?

Admiral McKEAN. And then action would be taken immediately.

The CHAIRMAN. And they were discussed before approval?

Admiral McKEAN. Yes; discussed in conference. We would sometimes read them all together, and each of us bring up points and ask what action we should take on this, and what action we should take on that, and then we would go back to our office and shoot it out.

The CHAIRMAN. Do you know of any delay on the part of Operations in regard to any of these recommendations?

Admiral McKEAN. I do not know of any such delay. I was not operating; I was only furnishing material, etc. I did the best I could and I think they did, and any unnecessary delay either the Secretary or Admiral Benson will have to answer about. I did not know.

The CHAIRMAN. If there were any unnecessary delay it was not on the part of Operations in carrying out these recommendations, was it?

Admiral McKEAN. I can only answer for the material side.

The CHAIRMAN. I did not say there was any unnecessary delay. I said if there was any it was not on the part of Operations, was it?

Admiral McKEAN. I can only answer for the material side. So far as my part of it was concerned, no.

The CHAIRMAN. Capt. Laning in his testimony stated that in March, 1917, you brought up at a conference of officers in Operations the question of formulating a plan to govern the Navy in case of war. Can you tell me anything about the circumstances?

Admiral McKEAN. I remember Laning was in my office. He was my senior assistant for material. I remember his doing like other officers and submitting his views and recommendations, but I do not remember the particular ones he refers to.

The CHAIRMAN. Did you bring up the question of formulating a plan?

Admiral McKEAN. Oh, I made my memorandum—my estimate of the situation—yes.

The CHAIRMAN. You suggested the formulating of a general plan at that time, did you?

Admiral McKEAN. Not of a general plan; no—a policy.

The CHAIRMAN. A policy?

Admiral McKEAN. Yes, sir; but from which we could work out detailed plans.

The CHAIRMAN. What became of your suggestion?

Admiral McKEAN. I have looked for that memorandum, and I have forgotten what the items were; but I remember one of them was a present of \$1,000,000,000 to France to square up for what had happened before, and to Great Britain, two billions, with the suggestion that we were not buying their real estate, but we would accept it if they would turn it over to us—all that they had on this side. Those were two that I happen to remember.

The CHAIRMAN. Those were matters that came up in this plan of yours to govern the Navy in time of war?

Admiral McKEAN. No; they were suggestions as to what action we should take when we entered the war. This was before the war opened.

The CHAIRMAN. Yes.

Admiral McKEAN. Each of us was giving our ideas.

The CHAIRMAN. And your ideas had nothing to do with what the Navy was to do, but simply the general policy of the Government?

Admiral McKEAN. Oh, yes; those were just ideas that were passed ahead. My recollection of it is that it was about two pages long.

The CHAIRMAN. But they were the principal points? The principal plan was to get ready, to give us a plan to govern the Navy in time of war, was it not?

Admiral McKEAN. I think, Senator, you have got a wrong idea of a plan, or you have got a different idea from what I have.

The CHAIRMAN. Have you a copy of the plan?

Admiral McKEAN. No, sir; I have not that memorandum. I have looked for that, but I could not find it. In my many movements I have destroyed it. But it was the policy, what we should do; and Capt. Laning and other officers put in the same sort of thing. They had all those suggestions, and they were boiled down and the responsible heads took out of them what they thought was good and then they told us to get busy and do them.

The CHAIRMAN. Why did you need to do that if there was already a plan in operations in existence?

Admiral McKEAN. Well, maybe we did not need to do it.

The CHAIRMAN. What?

Admiral McKEAN. Maybe it was not necessary that we should have done it; but each of us had some ideas of our own, and we made suggestions and recommendations.

The CHAIRMAN. Did you not make the suggestion yourself that a regular plan be drawn up to meet the special conditions of a war with Germany?

Admiral McKEAN. Yes; I think probably in conference with Capt. Chase I suggested it. I talked it over with him. I do not know where the suggestion came from, but that was probably the cause of that letter of his.

The CHAIRMAN. And was such a plan approved and put in force?

Admiral McKEAN. There was such a plan received. That is going back again to the lost one. I do not recall, Senator, ever having seen that plan or what it looked like or what it contained; but I do know the lines that it was worked out along, and we were working along those lines both before and after, all the time; and an outline of that plan is in Capt. Chase's letter to the board or the Secretary's letter.

The CHAIRMAN. Of your plan?

Admiral McKEAN. No; not my plan. I do not recall the details. I remember Laning working on plans, and I had suggestions and everybody else had them.

The CHAIRMAN. I know, but I am talking not about a detailed plan; I am talking about a plan for getting up a policy for carrying on the war against Germany, which according to Capt. Laning you suggested, and which, as far as I can see, was never paid any attention to.

Admiral McKEAN. Oh, yes; it was considered. Anything I submitted to my chief, in proper form, was given consideration.

The CHAIRMAN. Well, I can not see that any such plan was ever drawn up.

Admiral McKEAN. I do not recall what Laning refers to. He has got a better memory than I have.

The CHAIRMAN. At any rate, no such plan was followed?

Admiral McKEAN. I did not make one that was followed; no, sir.

The CHAIRMAN. I am talking about a plan to have a regular policy for the war.

Admiral McKEAN. Yes, sir; I think we had a policy for the war. It was to do everything that we could to help the Allies where they told us we could best help them and in the direction that they suggested, and that Admiral Sims recommended.

The CHAIRMAN. I asked you, Admiral, if you did not bring up at a particular conference of officers in Operations the question of formulating a plan to govern the Navy in case of war—not a plan itself, but the question of formulating a plan?

Admiral McKEAN. I do not remember it. I do not remember whether I suggested such a plan or not.

The CHAIRMAN. At any rate, you do not remember that any such plan was formulated?

Admiral McKEAN. No plan of mine was formulated and carried out.

The CHAIRMAN. I know, but this was not necessarily your plan. This was the question of the formulating of any plan. You do not know that any such plan was formulated in following your suggestion?

Admiral McKEAN. Not unless the general board's plan would be the result.

The CHAIRMAN. Would it not have been a good idea, if such a plan had been formulated?

Admiral McKEAN. Yes; it might have relieved me of doing some administrative planning work myself; but I would have had to have a change just as often as the plan itself or conditions themselves changed; I would have had to make the change myself in the subordinate plans.

The CHAIRMAN. Now, with regard to the delay in getting contracts for ordnance material approved, to which Capt. Laning referred, what means did you employ to get favorable action?

Admiral McKEAN. Ordnance material?

The CHAIRMAN. Yes.

Admiral McKEAN. I do not recall that I took any particular steps as to ordnance material. That would be for the Chief of the Bureau of Ordnance. I might have, at his request.

The CHAIRMAN. I think he handed you some memoranda?

Admiral McKEAN. I do not recall it.

The CHAIRMAN. And asked you to take action on it?

Admiral McKEAN. I do not recall, Senator. At the request of one of the material bureaus in that way for my support, I would push just as hard behind a scheme as I could with the Chief of Operations and with the Secretary. I do not recall the incident.

The CHAIRMAN. Do you recall Capt. Laning handing you any memoranda in reference to the 14-inch shells, and torpedoes?

Admiral McKEAN. No; I do not recall that except as Laning spoke of it. I remember something of the sort, and I must have

thought about it, because in my memorandum you notice suggestions of mine that we get the Hatfield process for production of armor-piercing shell.

The CHAIRMAN. Do you recall any delay in connection with this matter?

Admiral McKEAN. I do not know what happened. I know that they did not get the Hatfield process, because they thought they had a better one of their own possibly. I think they were right.

The CHAIRMAN. Do you recall any delay in connection with the 14-inch shell?

Admiral McKEAN. I recall a conversation about a shortage of 14-inch shell, but what the action was, Senator—the detailed action—I do not recall. I remember in a general way that there was a shortage of 14-inch shell. The contractors were not producing shell that would pass the test, or there were other difficulties—I have forgotten what they were. But that is all; only in a general way. It is one of a thousand things that I can not possibly recall, there are so many details.

The CHAIRMAN. And you do not know anything about the cause of that delay?

Admiral McKEAN. I did not know what the result of it was. I did not know when the shortage had been made up, or whether it has been made up even now. I hope it has, and it probably has, but I do not know, Senator. The Bureau of Ordnance can tell you all about those things. I know that there was a shortage.

The CHAIRMAN. You do not know the cause of the shortage?

Admiral McKEAN. I do not; no, sir. I do not recall the circumstances at all.

The CHAIRMAN. Now, in the memorandum prepared by Capt. Laning, which you signed on the 18th of May, 1917, concerning repairs to the battleships, why had there been such delay in getting these forces in condition for service?

Admiral McKEAN. I do not recall the particular memorandum. There is a question of precedence at the yards, always. There was a question of the availability of the ships of the fleet for repairs. We never settled on a program of overhaul and repair of vessels of the fleet unless we had such conference as Admiral Grant described in his hearing, where the commander of that force, or the commander in chief in case of the dreadnoughts, and usually in case of the others, came to Washington, and with the information that I had as to the dates at the yards and the capacity of the yards, we arranged the schedule of when we could best send the ships to the yards, which ones should go first, which yards should take care of them, and how much time we would be able to put on each ship; and I do not remember that memorandum you refer to at all, but we were in correspondence with the fleet at all times. If I would see the memorandum I would probably recall it.

The CHAIRMAN. We will return to that. I will have that memorandum.

Admiral McKEAN. Yes, sir.

The CHAIRMAN. To what extent was the definite approval of the Secretary necessary in all matters connected with material which came before you?

Admiral McKEAN. Wherever the expenditure of the funds of the bureaus or the making of a contract or an order involves an approval, which meant money, the law requires the Secretary's approval. Operations had no authority to expend funds or to direct the bureaus to expend funds.

The CHAIRMAN. Do you know of any instances in which delays occurred on account of the procrastination of the Secretary of the Navy, similar to those concerning which testimony was given by Capt. Laning, Capt. Palmer, and Capt. Taussig, and Admiral Plunkett.

Admiral McKEAN. Oh, I probably felt, Senator, very often when I wanted a thing very badly and very quickly, that the Secretary was very slow in making a decision. I am not naturally patient, and when I was convinced I thought the other fellow ought to be. The Secretary is not rapid in decisions involving the expenditure of funds. He hesitates until you prove it and clinch it, and sometimes re-prove it and reclinch it. He consults everyone. And it was difficult in times of peace to get the Secretary to authorize large expenditures. He was always thinking about justifying himself before your committees up here, and until you could convince him of the military necessity absolutely and beyond question, and also that he could justify the expenditure before Congress, you would not get him to approve an expenditure of any large amount; and I often had to present the same subject many times before I got a favorable decision. I never had the Secretary refuse to listen to my arguments. I always tried to get a little new point of view on it and present it in a different light, and sometimes I thought I had proven the case beyond question a dozen times, and then I would try it in the thirteenth and I would get it.

The CHAIRMAN. What effect did these delays have on the preparation of the fleet and auxiliary craft for war service?

Admiral McKEAN. I do not believe that those delays, Senator—those delays in decision, or, as I said in my testimony, delays of my chief's, or my making up my mind, or the chief or the Secretary, or of the Congress in giving the appropriations—I do not believe they affected the war that much [witness snapping his fingers].

The CHAIRMAN. You do not believe that affected the preparation of the fleet?

Admiral McKEAN. No, sir.

The CHAIRMAN. And the auxiliary craft?

Admiral McKEAN. The part of the fleet that was of particular value during the war; no, sir.

The CHAIRMAN. And the auxiliary craft, I say?

Admiral McKEAN. I do not understand that, "the auxiliary." Do you mean the supply ships and that sort of thing? That is what we call auxiliaries.

The CHAIRMAN. The supply ships and everything except the battle fleet.

Admiral McKEAN. There might have been some units that would have been ready, Senator, if we had gotten decisions sooner or appropriations bigger; but I could not locate any definite case, and, as I said in my hearing, I do not believe that affected our war position in the slightest, because the war was a new proposition, and we had the transport, which was one big thing, brand new, and we had to get everything for the submarine warfare, brand new, and we had to

hustle to try to get everything needed for that. We might have been readier, but I do not think the Secretary or the department——

The CHAIRMAN. But you have just testified that sometimes you had to go to the Secretary twelve times before he would fall in with your suggestion.

Admiral McKEAN. Oh, yes, sir.

The CHAIRMAN. And on the thirteenth attempt he would fall in.

Admiral McKEAN. Well, I had not been able to convince him the first twelve times. I had not presented the argument right. I came up here for 18 months trying to get——

The CHAIRMAN. But even so, that was a delay in carrying out the plans you put up to him, for a considerable time.

Admiral McKEAN. Yes.

The CHAIRMAN. Is not haste of some value during war?

Admiral McKEAN. I said this was before the war, in time of peace. During the war it was very seldom the Secretary delayed. Sometimes he delayed in big things, but that was a matter of policy, expenditure of money; and I did not go to the Secretary twelve times during the war for anything. He did not have time and I did not have time for that. I usually made it so forcible about the second trip that he either approved or I knew that I could not get it; either he did not approve or I got it.

The CHAIRMAN. So far as Admiral Sims's recommendations were made, most of them were adopted after a certain amount of delay, were they not, whether the delay was necessary or not?

Admiral McKEAN. I believe that many of Admiral Sims's recommendations were adopted.

The CHAIRMAN. The ones that he refers to in his letter of January 7?

Admiral McKEAN. No; he mentions some recommendations in his letter of January 7, or did not make some, that he afterwards made. The Chief of Operations and the Secretary can tell you about that. I was not in on that policy.

The CHAIRMAN. I am talking about specific recommendations he did make in his letter of January 7; and I say in nearly every case those recommendations were followed out at a later period in the war?

Admiral McKEAN. The only real recommendations that I get out of Sims's letters and his telegrams were: "Send antisubmarine craft; send personnel; go into the convoy system." Those are the three things that Admiral Sims seems to me to have recommended.

The CHAIRMAN. Of course he also recommended sending the battleships?

Admiral McKEAN. In the letter of January 7—Oh, which letter are you referring to? Do you mean his first letter?

Senator TRAMMELL. The chairman is referring to his letter of complaint of January 7, 1920.

The CHAIRMAN. I am referring to his letter of January 7, 1920.

Admiral McKEAN. Oh, the letter that is the foundation of this hearing?

Senator TRAMMELL. Yes.

Admiral McKEAN. Oh. The letter of April 19, which is the first letter we got—here is a reference to the battleships in his letter, paragraph 27 in the letter of July 7:

In addition to submarines, heavy forces are free to raid and in fact escape through the channel at any time when the enemy decides that the necessity or return will justify the risk. Hence the suggestion that two divisions of our fast dreadnoughts might be based upon Brest primarily for the resulting moral effect.

That was a suggestion from the people he was in consultation with. That was not a recommendation of his, as I understand it, at all.

The CHAIRMAN. I think you will find in his letter that he speaks about that—in his letter of January 7, 1920. He refers to his having requested battleships.

Admiral McKEAN. I do not think that you can complain, or that he could complain, of that, not sending them over.

The CHAIRMAN. I simply referred to that as another thing. You said there were only three things referred to in his letters. I was citing that as another thing. Of course he did request tugs, also.

Admiral McKEAN. Yes.

The CHAIRMAN. And he requested certain plans about the mine barrage; and there were a number of different suggestions, most of which were followed out later on during the war.

Admiral McKEAN. Suggestions which are good at one time are not practicable at another, and they are not good suggestions at the other time.

The CHAIRMAN. But if these recommendations could have been followed out very shortly after they had been made, do you not think it would have been a good thing?

Admiral McKEAN. Most of them; yes; decidedly.

The CHAIRMAN. So that if there was delay, it was unfortunate?

Admiral McKEAN. In some of them. As to the battleships, I do not think it would have made any difference at all.

The CHAIRMAN. For instance, the delay in sending destroyers over. I am not saying that there was a delay, but I am saying that if there was, it was unfortunate.

Admiral McKEAN. The destroyers; yes.

The CHAIRMAN. And any antisubmarine craft?

Admiral McKEAN. Yes; if there was delay.

The CHAIRMAN. So that if the method followed by the Secretary did cause delay in these matters, it probably had a bad effect on that particular portion of the war, did it not?

Admiral McKEAN. I was there all the time, Senator.

The CHAIRMAN. Well, Admiral, I am asking you whether, if there was delay, it probably did not have a bad effect?

Admiral McKEAN. No.

The CHAIRMAN. You think it did not?

Admiral McKEAN. Neither the delays before the war had a bad effect during the war. I can not hitch them up, because before the war we would not have been working on the type of vessel that we wanted to use during the war.

The CHAIRMAN. That is, it would have been an advantage to send over these ships to Admiral Sims that he wanted, but it would not have been of much value to send them over at the earliest possible moment?

Admiral McKEAN. It would.

The CHAIRMAN. And if there was a delay caused by the procrastination of the Secretary, which caused the delay in sending them over—

Admiral McKEAN. Oh, now, you are putting the question differently.

The CHAIRMAN. Let me finish my question.

Admiral McKEAN. Yes, sir.

The CHAIRMAN. If there was a delay on the part of the Secretary, you state it would not have had a bad effect?

Admiral McKEAN. No, sir. If there was such a delay as to have affected the movement of those particular vessels.

The CHAIRMAN. Yes; that is what I say.

Admiral McKEAN. I did not get your question. If there was delay, most undoubtedly.

The CHAIRMAN. Do you believe that when the war started the battleships, destroyers, cruisers, and submarines were in a material condition to fight in the most efficient manner?

Admiral McKEAN. Certainly not all of them.

The CHAIRMAN. Can you explain briefly to the committee what was the reason for ships not being entirely ready as to material?

Admiral McKEAN. Money and men and the yards.

The CHAIRMAN. Prior to the war was it the policy of the department to keep all ships ready so far as material was concerned?

Admiral McKEAN. It was.

The CHAIRMAN. Were there always sufficient funds to keep the ships materially ready?

Admiral McKEAN. No, sir; we spent all we had and could not get it done.

The CHAIRMAN. In asking for funds to carry on work on ships prior to April 6, 1917, was it the policy of the Secretary of the Navy to always request from Congress the funds that the material bureaus recommended as necessary to carry on their work?

Admiral McKEAN. I do not know. I do not think the Secretary ever approved all the bureaus asked. I do not think Congress gave us always all that the Secretary asked.

The CHAIRMAN. Did you ever hear of any requests for appropriations being blue-penciled?

Admiral McKEAN. Oh, yes; every estimate is, by law, gone over, and the estimates of the bureaus are adjusted, cut out, revised, expanded. That is the duty of the Secretary.

The CHAIRMAN. But if the estimate of a chief of bureau were blue-penciled, what would you understand that that meant?

Admiral McKEAN. Well, if it was checked, that estimate for that particular object went out.

The CHAIRMAN. That is, if the Secretary did not approve of it?

Admiral McKEAN. Oh, yes; the Secretary and the Assistant Secretary reviewed estimates for appropriations, as was their duty under the law, before they were submitted to Congress. They were the Secretary's estimates.

The CHAIRMAN. Before the war, did you know of any estimate being blue-penciled so that that bureau found it impossible to provide all that was necessary for the fighting ships?

Admiral McKEAN. I do not know that the blue-penciling, Mr. Chairman, was the cause of it, but I do know that the bureaus did not have enough money, several of them, several times; they did not have enough money in the previous appropriations to carry us through the year at the pace we wanted to go in the way of preparing the fleet. They could not keep up.

The CHAIRMAN. You have referred several times to Congress cutting you down on appropriations. If the estimates were blue-penciled before they got to Congress, the responsibility would not be on Congress?

Admiral McKEAN. Oh, no, sir. I think it would split about 50-50, Senator.

The CHAIRMAN. Not in regard to blue-penciling.

Admiral McKEAN. Oh, no; the blue-penciling belongs to the Secretary and the Assistant Secretary.

The CHAIRMAN. As aid for material, did you ever find that the material condition of our ships could not be kept up to the highest point of efficiency on account of any delay on the part of the Secretary of the Navy in asking for appropriations?

Admiral McKEAN. I could not fix that. I would have to get a particular case and see if it was because they cut the Secretary's estimates, or whether the Secretary cut the estimates.

The CHAIRMAN. You can not answer that?

Admiral McKEAN. No, sir.

The CHAIRMAN. Did the Secretary of the Navy always ask Congress for all the money you knew would be necessary to keep our ships materially ready?

Admiral McKEAN. No, sir.

The CHAIRMAN. He did not?

Admiral McKEAN. No, sir. It was not my job to make recommendations, but I knew that the appropriations were too small, often.

The CHAIRMAN. Can you tell me when the battleships were sent to the navy yards to prepare for war?

Admiral McKEAN. I think I told you in my direct testimony that after the fleet came north—you mean the dreadnoughts?

The CHAIRMAN. Yes.

Admiral McKEAN. After the fleet came north, after they had had their annual drill, we arranged—Admiral Mayo and the department—to send them in turn, keeping as few as possible at the navy yards and keeping those there the shortest time possible, and we arranged a schedule by which we ran the whole of the dreadnought list through at the earliest date practicable. I have forgotten when we got through with them.

The CHAIRMAN. This was after the war?

Admiral McKEAN. Yes.

The CHAIRMAN. Do you remember making any recommendations that they be sent, before the war?

Admiral McKEAN. Yes; we recommended from the material point of view that they be sent a great deal earlier than they were. But that was not approved. But I think that probably our material ideas overcame our military judgment a little. My chief did not approve that, and the admiral, the commander in chief, did not approve of it.

The CHAIRMAN. Do you think that the Secretary of the Navy always presented the needs of the Navy Department in the way that would make the Navy efficient for war?

Admiral McKEAN. I do not know, sir. I have always congratulated him as the most successful Secretary of the Navy in working Congress that I ever knew. He got more than any other Secretary I have ever known.

The CHAIRMAN. More than he asked for?

Admiral McKEAN. Sometimes, on some things.

The CHAIRMAN. I say, more than he asked for?

Admiral McKEAN. More than he asked for; yes, sir. I think he was very successful with the committees.

The CHAIRMAN. In the first two or three months of the war was there any delay in providing essential craft to carry on the war because of the lack of funds?

Admiral McKEAN. The first two or three months of the war?

The CHAIRMAN. Yes.

Admiral McKEAN. I think the first emergency appropriation was \$115,000,000. That came in February or March. I think we used that up and overobligated it, but I do not think there was any essential delay in craft, getting those craft, except the authority, the distinct authority, which was required for purchasing and for commandeering. I think the commandeering law—I have forgotten the date it came through—helped us out materially.

The CHAIRMAN. I asked you whether it was on account of the lack of funds?

Admiral McKEAN. I do not think so; no, sir. I think with that \$115,000,000 we expanded with we went just as far as we wanted. I think we overexpanded it many times.

The CHAIRMAN. But you state that later on you had to get another one, late in October, and we could not do anything until we got it?

Admiral McKEAN. That was starting a new building program.

The CHAIRMAN. You said that we could not start such a program until we got it.

Admiral McKEAN. I do not think that the Secretary would have been justified in starting a new building program without the approval of Congress. I think that would have been rather stretching the discretion.

The CHAIRMAN. He could have started it at any time he saw fit, could he not, and asked Congress for its approval?

Admiral McKEAN. I do not remember how the appropriations—those different emergency appropriations—were worded. I do not recall, Senator. But I think on a big matter like 150 destroyers, costing millions apiece, it is going a good ways.

The CHAIRMAN. What, in your opinion, was the condition of the Navy with regard to personnel when the war started?

Admiral McKEAN. As I said, we were undoubtedly very short of officers and very short of men.

The CHAIRMAN. From your knowledge of the Navy and naval affairs, do you know whether or not the Secretary of the Navy made proper representations to Congress in the years just before the war to provide adequately for the necessities of the Navy in personnel?

Admiral McKEAN. I think that the Secretary of the Navy failed to make the recommendations. I think it was in the fall of 1915, when the General Board's report recommended 19,600 men, the Secretary did not recommend any, and that was because of the error of the advice which the Chief of the Bureau of Navigation gave him in using the peace complement. He said he had enough. I think that was an error, undoubtedly. I think we needed the 20,000 men at that time.

The CHAIRMAN. And they would have been very helpful at the outbreak of the war?

Admiral McKEAN. Yes. In the fall of 1916—Admiral Blue was still there at that time—their estimates were 8,000 to 10,000 in their annual report, and it had gotten up to 28,000 by the time the bill was passed, August 29, 1916. I think they were both mistaken in the number of personnel needed. I think that had those recommendations been made and had Congress given them to us, we would have had a great many more trained men when we went into the war, and they would have been very valuable.

The CHAIRMAN. So that the failure to make such a recommendation tended to keep the Navy from being ready for war when it was declared?

Admiral McKEAN. Yes; shortage of personnel is bound to have that effect. It takes time to train them; and we could not recruit all that were authorized when we got into the war, and we could train but very few of them.

The CHAIRMAN. As to material, did the Secretary of the Navy, in the years just before the war, make proper recommendations as to what was necessary to get ready for war?

Admiral McKEAN. Make proper recommendations?

The CHAIRMAN. To Congress?

Admiral McKEAN. To Congress? I think he did. They were proper, as far as they went. They did not go as far, and he did not make quite as big recommendations as I would have liked to have seen.

The CHAIRMAN. Ships are of no great use in the Navy without officers and men to man them?

Admiral McKEAN. No, sir.

The CHAIRMAN. Or without sufficient officers and men to man them?

Admiral McKEAN. They are not of their full value unless they are fully officered and manned by properly trained officers and men.

The CHAIRMAN. The following official statement appears in Admiral Fullam's testimony. It was in a letter from J. H. Dayton to Admiral Fullam.

There was also a letter from Admiral Blue, and another one from Admiral Palmer. I will read these letters:

NAVY DEPARTMENT, BUREAU OF NAVIGATION,
Washington, D. C., March 6, 1916.

DEAR ADMIRAL: Your letter of February 24 has been received. Rear Admiral Blue is on leave, therefore I am answering it.

I regret we can not give you the officers and men necessary to put your excellent scheme into effect. There are no officers of the rank of commander available, and the only way to get officers below the rank of commander would be to take them from the battleships of the Atlantic Fleet, which, of course, would not be practicable.

In regard to the men, we have got to provide crews for the *Nevada*, *Oklahoma*, *Pennsylvania*, *Wainwright*, 12 submarines within the next six months; and in addition to that the Naval Academy Practice Squadron will have to be filled up, so the situation is rather hopeless from our point of view. However, we will do the best we can.

With kind regards, I am

Very sincerely, yours,

J. H. DAYTON.

Admiral W. F. FULLAM, United States Navy,
U. S. Pacific Reserve Fleet, U. S. S. Milwaukee.
Care of postmaster, San Francisco.

Senator TRAMMELL. What is the date of that?

The CHAIRMAN. March 6, 1916.

The second letter is from Admiral Blue and reads as follows:

NAVY DEPARTMENT, BUREAU OF NAVIGATION,
Washington, D. C., July 5, 1916.

MY DEAR ADMIRAL: Replying to your letter of June 20, I regret that it is impracticable to send any additional officers to the reserve ships unless mobilization takes place and retired officers are ordered to duty and officers from shore are ordered to sea.

Sincerely, yours,

VICTOR BLUE.

Rear Admiral WILLIAM F. FULLAM, United States Navy.
Commander Reserve Force, Pacific Fleet.

Then there is the letter from Admiral Palmer, dated August 24. [Reading:]

NAVY DEPARTMENT, BUREAU OF NAVIGATION,
Washington, D. C., August 24.

To: Commander, Reserve Force, Pacific Fleet.

Subject: Completion of *West Virginia's* repair period; preparation of that ship for joining the reserve force in cruising exercises.

1. The bureau has, at present, the following commissioned officers on the ships of the Reserve Force: *Maryland*, 7; *New Orleans*, 1; *Pittsburgh*, 8; *Saratoga*, 1; *South Dakota*, 7; *West Virginia*, 4; total, 28.

2. This gives an average of about five per ship. This is the maximum that can be allowed until the department releases sufficient personnel by placing ships out of commission.

3. In the meantime recommendation is requested of the commander, Reserve Force, for nominations of officers from those ships of his command having more than five commissioned officers for their further transfer to the *West Virginia* and *Saratoga*.

4. There is no additional enlisted personnel available for fitting out the *West Virginia* and the *Saratoga*. It is requested that such men as are necessary be requested from the commander in chief, United States Pacific Fleet.

L. C. PALMER.

Then also here is an order from the Bureau of Navigation to the commander of the Reserve Force, via NPG. This reads as follows:

MARCH 25, 1917.

You are authorized to publish the fact that the President has signed an Executive order, calling for an emergency increase to 87,000 enlisted men. Give widest publicity. You are authorized to state number of men needed in your force and to enlist and retain on board men to fill vacancies.

Did not the first three letters clearly indicate great shortage of personnel and prove that the General Board was right and that Admiral Blue was wrong as to the personnel needed?

Admiral McKEAN. I think so, undoubtedly.

The CHAIRMAN. In view of this hopeless situation in the summer of 1916, whose duty was it to insist upon additional personnel, if there was any desire or any will to prepare the Navy for war?

Admiral McKEAN. Primarily, the Chief of the Bureau of Navigation; to the Secretary of the Navy, and the Secretary of the Navy to Congress; the personnel not coming under Operations.

The CHAIRMAN. An increase of 87,000 men was not made until March 25, 1917.

Admiral McKEAN. That authority of the President, of course, was given to the Secretary of the Navy.

The CHAIRMAN. That was only 13 days before the war?

Admiral McKEAN. Yes.

The CHAIRMAN. Of what avail were plans for getting armored cruisers and other vessels ready for war, and orders for maneuvers, drills, target practice, and so forth, if there were insufficient men to get the ships away from the docks and keep them going?

Admiral McKEAN. I have no guide for that other than the demands for the material for the reserve fleet, which I read into the record yesterday, and that is all that I had to do with it.

The CHAIRMAN. Still, you can tell me whether it was of any avail to order these things if there were insufficient men to get the ships away from the docks and keep them going.

Admiral McKEAN. No, sir; it is my idea that a part of the material deterioration of those ships in reserve was due to the lack of personnel. If they had had a reserve complement on them they would have been in better condition, better cared for, and the crews at the navy yards would have made repairs.

The CHAIRMAN. So that personnel was a vital question, and the real key to getting the Navy ready?

Admiral McKEAN. It was, indeed. It is the only thing that puts life into the inanimate material.

The CHAIRMAN. Was it possible to fully develop navy yards shortly before and during the war?

Admiral McKEAN. No. The development of the yards on the east coast, which we limited ourselves to during the war, was not completed by the end of the war. There are some of the yards that are not completed yet. If I understand the question, it is the time element. There are some of the things, like dry docks, etc., that take a long, long time, and they are the fundamental essentials, and it was not possible in the short time. It takes five years to build navy yards at the best speed you can make, with unlimited cash.

The CHAIRMAN. It was of paramount importance, was it not, to get the ships manned and gradually repaired during 1915 and 1916?

Admiral McKEAN. It was essential if we were preparing for war; and as I said before, I think the Navy is not of any use unless it is prepared for war.

The CHAIRMAN. If it had been the determination or the desire of the Secretary of the Navy to make the Navy ready after the sinking of the *Lusitania*, should he not have asked Congress for men and officers?

Admiral McKEAN. If it was his intention, you said?

The CHAIRMAN. To make the Navy ready?

Admiral McKEAN. Asking for officers at that time would have been better than getting them later. Asking for men at that time would have been better than getting them later. But as to "should," that implies duty. I do not want to pass on what the Secretary's moral duty was.

The CHAIRMAN. It was not the duty of Congress to initiate such legislation without any request from the Secretary?

Admiral McKEAN. No; it would not be of Congress, as I understand, until the policy of the country had changed.

The CHAIRMAN. You have just testified that you thought he should have followed the recommendations and asked for 19,600.

Admiral McKEAN. For a sufficient personnel to keep that fleet ready; yes, sir.

The CHAIRMAN. Yes.

Admiral McKEAN. But as to distinct preparation for war—

The CHAIRMAN. But I asked you, had it been the determination or the desire of the Secretary of the Navy to make the Navy ready

after the sinking of the *Lusitania*, should he not have asked Congress for men and officers? You have already testified that he did not.

Admiral McKEAN. I would not put in the sinking of the *Lusitania*. It was just as much his duty before to prepare for it as after.

The CHAIRMAN. At any rate, whether or not it was before, it was after?

Admiral McKEAN. Yes; at all times; to keep the Navy prepared for war.

The CHAIRMAN. So that it was his duty to have asked Congress for men and officers if he desired to keep up the Navy?

Admiral McKEAN. Yes; but the *Lusitania* was what got me. It was his duty all the time, from my point of view; because, as I say, the Navy should be prepared for war all the time.

The CHAIRMAN. Yes. Well, the *Lusitania's* sinking would not mean that we would not have to?

Admiral McKEAN. I would not decrease the desirability of the preparation, Mr. Chairman, no.

The CHAIRMAN. Did you not consider that war was probable after the sinking of the *Lusitania*?

Admiral McKEAN. Yes, sir; it was the *Maine* of this war.

The CHAIRMAN. What is that?

Admiral McKEAN. The *Lusitania* corresponded with the *Maine* in the Spanish war. I do not think you could stop it after that.

The CHAIRMAN. If all naval vessels had been gradually repaired and made ready as to material during the years 1915 and 1916, would not the navy yards have been comparatively free to undertake new construction?

Admiral McKEAN. We were doing all the work in the navy yards in 1915 and 1916 that they were capable of performing, with the number of men available. I kept the yards full all the time after July, 1915, up to their capacity.

The CHAIRMAN. That may be; but if we had had plenty of men——

Admiral McKEAN. If the appropriations had been larger and we had hired more navy-yard employees, we could have done more work, undoubtedly.

The CHAIRMAN. Would it not have made your task much easier, and would not congestion in the navy yards have been avoided, if the vessels of the Navy had been made systematically ready for war before war was actually upon us?

Admiral McKEAN. Decidedly so, and everybody else's.

The CHAIRMAN. Do you not think that after the sinking of the *Lusitania* the Nation was justified in preparing for war specially?

Admiral McKEAN. Personally, I do, yes. Under the strict interpretation of our position as neutrals and under the instructions of our commander in chief, no.

The CHAIRMAN. Where do you get that?

Admiral McKEAN. Neutral in thought.

The CHAIRMAN. That refers to the commander in chief?

Admiral McKEAN. To our commander in chief; yes, sir.

The CHAIRMAN. Aside from the commander in chief, you state that under the strict construction of neutrals, we would not be justified in doing that. Where do you get that?

Admiral McKEAN. Not having a very high regard for international law with no court to enforce it, I may not go quite as far as other

people. I would not have hesitated had I been responsible, because it might appear an unneutral act, or appear sufficiently so for any of the belligerents to protest. I think that at all times, under all conditions, under international law and everything else, the right of self-preservation of nations is like that of men. If you see the other fellow is quarrelsome, get your gun.

The CHAIRMAN. And you think that subsequent to the sinking of the *Lusitania* we should have at once prepared to the greatest extent we possibly could in the case that war came on us?

Admiral McKEAN. Well, had I been responsible for it, that is what I would have done, Senator. What other people should do, that is not my say.

The CHAIRMAN. And you think that certainly waiting until two weeks before the war began to increase the personnel was rather a tardy way of going about preparing the Navy?

Admiral McKEAN. I think that you have got to take—yes, I do—but you have got to take our people's attitude, and our fall elections of the year before, and a lot of national policies into consideration before you condemn individuals, Senator. There are a good many millions of people in our country, and they were not all ready to fight in the fall of 1916, and a good many of them were not ready to fight in the spring of 1917.

The CHAIRMAN. But most of them were ready to take steps to defend themselves, were they not?

Admiral McKEAN. Well, we had to take steps to defend the country against some of them, so those people were not very—

The CHAIRMAN. Yes, but that does not answer my question.

Admiral McKEAN. Yes, I think our people were ready to take steps for defense, and I think a good many of them were ready to fight, but I do not think all the public—

The CHAIRMAN. There were practically none of them that were not ready to take steps for defense?

Admiral McKEAN. I have forgotten the date of the election in the fall of 1916, but the votes did not show that they were very anxious for a scrap, then.

The CHAIRMAN. No; but at least they would be ready to protect themselves, would they not?

Admiral McKEAN. I could not draw the line.

The CHAIRMAN. Well, I take it that naval protection would mean safety?

Admiral McKEAN. I think so. It is the first line of defense.

The CHAIRMAN. Do you not think that the people of this country at that time were largely in favor of safety?

Admiral McKEAN. I think the people of our country had—oh, for years, since the Spanish-American War—been in favor of the Navy being built up so that it would be competent to do the job, at times.

The CHAIRMAN. Yes; but at this particular time?

Admiral McKEAN. Yes; all along. I do think that. I think that the majority of our people are in favor of it now.

The CHAIRMAN. And nobody wanted to take any chances? They might not want to go in for an aggressive war, but at least they were willing to appropriate money to keep themselves safe, were they not?

Admiral McKEAN. I do not know. It was not as easy to get appropriations in 1915 as it was in 1916, and it was not as easy in 1916 as it was in 1917.

The CHAIRMAN. Do you not think, Admiral, that if the Administration had given to the country the information that it had in its hands in the fall of 1916, it would have been a very easy matter to get appropriations from Congress to provide for the safety of this country?

Admiral McKEAN. You are getting me into the guessing field now, Senator. That is too big a problem for me to tackle.

The CHAIRMAN. You do not care to answer that question?

Admiral McKEAN. No, sir; I do not consider myself competent enough in national politics to answer that question.

The CHAIRMAN. In waiting until two weeks prior to the declaration of war before asking for men, and not beginning to systematically repair all ships, in anticipation of war, were not our navy yards overcrowded, and was there not great difficulty in manning naval vessels?

Admiral McKEAN. Yes, undoubtedly; but you say "systematically repairing ships." I claim that we were doing it, within our capacity.

The CHAIRMAN. Should not all available scouts and screening vessels have been ready for war in 1917, as a proper protection for and necessary adjunct to our fleet?

Admiral McKEAN. They could not have been ready at all times. There was no special reason for that special class being given preference over other classes at that time.

The CHAIRMAN. Capt. Pratt and Admiral Badger have both declared that our fleet would have been endangered in battle with a hostile fleet in April, 1917, for lack of scouts and cruisers.

Admirals Strauss, Rodman, Wilson, and Fletcher have certified that our fleet could have successfully met the German fleet without cruisers and with only a thin screen of destroyers. With which group of officers do you agree?

Admiral McKEAN. With a hypothetical question and essential conditions which you have got to represent on the game board, the personnel question, and conditions equal between the two sides, then playing it out on the game board, giving proper values to the units, theoretically the answer to the question—which is a hypothetical question—would be that the German fleet was the stronger fleet than was ours; and any fleet without scouts, without screening and protecting vessels, is seriously handicapped.

But you put those two fleets on the game board and play it out according to the rules, which is the nearest approach to practice that we can get without the actual scrap, I would put my money on the black.

But when it comes to asking us to say, Senator, that our fleet as it came north, if it had met the German fleet east of our own coast, half way across the ocean, or over there, that is again hypothetical, and it is awfully painful for an officer to say that he thinks that the Huns could have licked us, under any conditions. But make it theoretical and put it on the game board and count it theoretically on your hypothetical question, and I follow Capt. Pratt entirely. We are in full agreement.

The CHAIRMAN. Would it be painful for you to say that a light cruiser could not meet a dreadnaught with any hope of success?

Admiral McKEAN. No; but there are light cruisers that under certain conditions, with certain personnel, doing the David and Goliath stunt, you know—things like that have happened. But you do not theoretically allow for them.

The CHAIRMAN. But you would not advocate it in war?

Admiral McKEAN. I would not advocate it, but I would expect one of our youngsters, if he was right up against it, that he would do it.

The CHAIRMAN. But you would not advocate sending out two dreadnaughts against ten dreadnaughts of equal size, would you?

Admiral McKEAN. I would not advocate it, but if they were sent, it would be very painful—

The CHAIRMAN. Of course they would do it and would put up the best fight they could.

Admiral McKEAN. Yes, and the other fellows would know that they had been there.

The CHAIRMAN. Yes, but as a practical proposition it is not sound?

Admiral McKEAN. Theoretically, it is not good doctrine.

The CHAIRMAN. Then you would say that our battle fleet as it existed in April, 1917, consisting of battleships and a few destroyers, could not have successfully met the German fleet as it met the British fleet at the battle of Jutland?

Admiral McKEAN. Where?

The CHAIRMAN. In midocean.

Admiral McKEAN. According to all the values given to the units, no; but the German fleet would not have hurt anybody else much after our fleet got through with it.

The CHAIRMAN. That might have been. Has there ever been any plan to inspect and prepare to commandeer yachts and merchant vessels for war purposes, to decide on their batteries, provide guns for each ship, and fix the quota of officers and men so that such vessels could be quickly made ready to reenforce the Navy?

Admiral McKEAN. Yes; the Board of Inspection and Survey has a section devoted to the inspection of merchant ships, and they have in the districts a list of ships, and the Joint Board of the Army and Navy have picked out the ships as to the duties they are best fitted for, and would be most available for in war, which service is going to get them, and so on, and in the General Board's plan, the taking over of certain of those merchant ships for those purposes is included. The details, the complete working out, of where they should be altered, at what yards, and what material, and so forth, would be necessary, has never been worked out to my knowledge.

The CHAIRMAN. We did not have such a plan prior to the outbreak of the war?

Admiral McKEAN. We had the foundation of such a plan.

The CHAIRMAN. But we never had the details?

Admiral McKEAN. We never had the details worked out, I do not think.

The CHAIRMAN. Germany did, did she not?

Admiral McKEAN. I imagine she had, because she owned or had governmental control over all the merchant craft. She did not have to have commandeering orders. She took them.

The CHAIRMAN. Did England have any such plans prior to the war, do you know?

Admiral McKEAN. I do not know. Judging from other plans, no.

The CHAIRMAN. Would it not have been a wise provision between 1914 and 1917 for us to have had some such plan?

Admiral McKEAN. My recollection, Mr. Chairman, is that we were working on such plans with the officers who were available, inspecting

these merchant ships as they came into port, determining their qualifications, and keeping our list as completely up to date as we could with the personnel we had.

The CHAIRMAN. But if we had had such a plan carefully worked out and if our navy yards had been freed of regular naval vessels, the latter having been previously made ready, could not all these yachts and merchant vessels have been expeditiously altered, armed, manned, and made ready, and could they not have gone overseas much sooner than they did?

Admiral McKEAN. Yes; it might have speeded some of them up. But, once again, you would have been up against the real crucial situation, man power and material. We could not get the men. We could not get material. When we got the material, we did not have the men to work it up right. They were not skilled. They were farmers driving rivets.

The CHAIRMAN. Do you believe in waging war offensively or defensively?

Admiral McKEAN. Offensively, always.

The CHAIRMAN. Would not this especially be the case when the enemy's move is blockaded, with the exception of submarines—blockaded on the water?

Admiral McKEAN. Yes; then or any other time. At all times.

The CHAIRMAN. Then why should the United States have kept many vessels out of the war zone, especially as warning was always given when submarines were coming, and we were told that such warning would be given?

Admiral McKEAN. I do not think that the United States kept the ships out of the war zone with the idea of taking the offensive. I think they were preparing the defensive to launch the offensive, and I think we sent those vessels over there, as I said in my statement, almost as soon, and certainly in better condition, by having organized them first into a patrol force, and then the units drifting to the yards, and going over in groups; I believe that they arrived in Europe ready for business just as soon as if the whole patrol force had been brought out and sent to the yards and swamped us, and said "Get them ready." I do not think we would have gotten them over a bit sooner.

The CHAIRMAN. Do you not think it would have had a great moral effect if we had sent our Navy over immediately after the declaration of war, not a part of the Navy, but the battleships, the whole of it?

Admiral McKEAN. We could not maintain it over there. They did not want our oil-burners over there. We could not get the oil across. That was one of the hardest jobs. When the armistice was signed we owed the British Government 70,000 tons of fuel oil. We could not send it. The oil for the destroyers ran up an awful bill; and then every destroyer that we sent over there meant more tankers. That is why part of this force was kept guarding the oil lines. If the German submarine had been a wise submarine and had busted up the oil route—

The CHAIRMAN. If we could have sent them over, do you not think it would have had a good moral effect?

Admiral McKEAN. Undoubtedly; it would have cheered the other fellow up. But the moral effect—

The CHAIRMAN. No, I mean the moral effect on the Germans?

Admiral McKEAN. I do not know, sir. We kind of hoped that it would have an immoral effect on the Germans, and bust their morale.

I do not think it would have affected the Germans so much, earlier. I think our effect on the German morale ultimately, our antisubmarine methods, did do a good deal to help out, a good deal more than the per cent that our forces were of the total forces.

The CHAIRMAN. It is a matter of record that the commander of the reserve forces in the Pacific on February 23, 1916, more than one year before we declared war, called the attention of the department to the absolute necessity for officers, warrant officers, petty officers, and men, and declared, "If the Navy Department does nothing in this line all plans and schemes to improve the efficiency of reserve ships—not to say other ships—will simply remain on paper."

Should not such a letter have received favorable consideration by the Secretary if he really expected or wished to get ships ready for war?

Admiral McKEAN. I do not know that it did not receive favorable consideration. That was about the time, February, 1916, that was the time that the Secretary was getting along in the increased number that he recommended to Congress, when he was getting up to the 28,000. I think probably that helped us in getting them. If he got the 28,000 on August 29, 1916, and that 28,000 was the result of the cumulative efforts of Admiral Fullam and all the rest of the people who were short-handed.

The CHAIRMAN. So that you think it should have received favorable consideration?

Admiral McKEAN. I have no doubt that it should have received favorable consideration. The officers were not available and the men were not available.

The CHAIRMAN. Now, in regard to the recommendations in 1914, whose recommendation do you think the Secretary should have approved, that of the General Board or that of Admiral Blue, in regard to the shortage of personnel?

Admiral McKEAN. Personally, I would have taken the General Board's.

The CHAIRMAN. And you think that the Secretary should have taken the General Board's?

Admiral McKEAN. Well, had I been asked to advise him on that subject, I would have advised him to take the General Board's, because I thought Blue was decidedly wrong, and I thought I knew where he was wrong.

The CHAIRMAN. I gathered from your testimony that you would not say that the fleet as a whole was ready for war in material and personnel in April, 1917?

Admiral McKEAN. No, sir; it was not ready for war as to personnel or material; that is, 100 per cent ready, or anything like 100 per cent.

The CHAIRMAN. Capt. Pratt stated that the Navy Department was not properly organized for war, and had to be reorganized. Now, what is your opinion? Could it not have been better organized between 1915 and 1917 had we anticipated and prepared for war?

Admiral McKEAN. Yes. I always had very distinct views on the defects of the organization, and I think that Capt. Pratt referred not only to the necessity of reorganization, but that involves a large expansion that took place as well as some modifications in the

organization. War brought some of the modifications that in peace would require laws. That is going back again to the remark about a gentlemen's agreement. A gentlemen's agreement in peace might do. In war it is the essential duty of all of the country to control all the little jealousies and friction. They just dropped out, and we got busy. Never mind bureau business or anything else. I think the organization ought to be changed. I think if we had had an aid for personnel with the same duties as the aid for personnel under the chief of operations, that I had as assistant for material, while he might have made the same mistakes as to personnel that I made in reference to material, they would not have been as many and as serious as when it was a separate and detached Bureau of Navigation; and this investigation here would have involved nobody except the Chief of Operations, under the letter, the Chief of Operations and his two assistants, and personnel, and his assistant chief of staff, the assistant to the Chief of Operations. We four would have been the only ones. I do not think that the Secretary would have appeared in the discussion.

The CHAIRMAN. Have you any questions to ask, Senator Keyes? Senator KEYES. Not now.

Senator TRAMMELL. In regard to the question of plans, Admiral, you had made sufficient plans to carry on the operations in your particular division, had you?

Admiral McKEAN. We had all the plans that in my opinion were necessary for our efficiently doing my job; all I ever asked for; all I thought I needed. I might have suggested to clear up for other people, but I knew what I was expected to do.

Senator TRAMMELL. The question of whether or not they were put through a course of red tape, and so on, in the way of printing and being in the nature of a formidable document, did not make any particular difference, did it?

Admiral McKEAN. No, sir; I did not care a cent. A pencil memorandum was just as good as a copper plate.

Senator TRAMMELL. As a matter of fact, is it the system or is it necessary or wise to take those plans and print them and circulate them into other divisions and elsewhere, where they have nothing to do with them?

Admiral McKEAN. No, sir.

Senator TRAMMELL. As a matter of fact, would not that increase the opportunity for the enemy to find out what you were doing?

Admiral McKEAN. Undoubtedly, any leak——

Senator TRAMMELL. And the fact that these were not given general circulation in the divisions and apartments, and with many officers that had nothing to do with them, probably was actuated to an extent not only in the way of expedition, but was actuated from a further disposition to lessen that opportunity?

Admiral McKEAN. Undoubtedly; and we often did not put them in the hands of typewriters, did not take them to stenographers, or did not print them, because we did not want anybody to know what was doing. We kept our plans in our heads, and when we discussed them, we tore up the paper and burned the notes.

It seems to me that there is a good deal of misunderstanding about the necessity for detailed plans. I think the accent on the plan business is placed too strong. I did not miss the plans so much during the war.

Senator TRAMMELL. I believe you stated in your opening testimony that if you were to map out an offensive plan for a definite, stated objective, or campaign of war, then, of course, you would have to go into all your details, but if you were occupying more of a position of defensive, you would have to be actuated and controlled more by the conditions as they arose from time to time in the theater of war?

Admiral McKEAN. Yes; if you are on the defensive, the other fellow controls the plans. As long as he can keep you on the defensive, and he has the initiative, you have to adapt your plans as he shifts his. He is doing the plan making.

Senator TRAMMELL. If there had been a general plan for an offensive for an engagement with the German fleet, as far as this particular war was concerned, you would not have needed it, would you?

Admiral McKEAN. Oh, I would not have needed it at all, no; a plan for an engagement. You would not go that far. You plan what fleet you are going to meet the German fleet with and the where and the when and the how they are going to meet them, that is in the hands of other people.

Senator TRAMMELL. You have to leave that to the commander in chief of the fleet?

Admiral McKEAN. Yes, sir.

Senator TRAMMELL. It is equally true that you would have to leave to the different departmental heads, the bureau heads, the matter of the details of the preparation of the material or whatever may come under that particular division, too, is it not?

Admiral McKEAN. Yes; and what the plan calls for and requires how they got it, and how it would be supplied, etc., was entirely a bureau matter, with which we did not interfere in the slightest.

Senator TRAMMELL. You were asked the question, whether there was any specific instruction that the fleet should be prepared for service in foreign waters, and you stated that there was not; but as a matter of fact, when war was more imminent with Germany than any other nation, of course, would not your general plan for preparation for war or improving your Navy embrace that without being told that you had to do that?

Admiral McKEAN. I think that we were all successful——

Senator TRAMMELL. I mean your general idea and conception of preparation would embrace that feature?

Admiral McKEAN. Undoubtedly every one of us, when he was working out any situation, was thinking about Germany.

Senator TRAMMELL. You had no specific instructions to prepare for entirely coast defense, either, had you?

Admiral McKEAN. No.

Senator TRAMMELL. But, as a matter of fact, that was a part of the general scope of the preparation?

Admiral McKEAN. Yes; one of the first steps.

Senator TRAMMELL. You would not consider it any particular oversight or neglect in the way of mapping out a general policy, then, that you were not specifically instructed to prepare for service in foreign waters?

Admiral McKEAN. I got all the instructions, Senator, that I needed for my job.

Senator TRAMMELL. On the question of the preparation of docks and yards, and so on, I believe you stated that the plans were made

up for Hampton Roads and some other projects, and approved by the Secretary of the Navy, some 18 months before you obtained the appropriations?

Admiral McKEAN. My recollection is that it was 18 months for the operating base at Hampton Roads, before I got the money, after the Secretary had approved it; and it was a year after I got the Secretary's approval before I got the appropriation for Coco Solo, the submarine and aviation bases, for the protection of the canal.

Senator TRAMMELL. You were questioned in regard to whether or not the Secretary informed the committee that this was absolutely essential for war, and of course, you stated that you did not know the verbiage of his recommendations, or the particular language that he employed to advocate his approval; but you did state that he approved it, and that he urged the committee, as I understand, to make these appropriations for these particular needed improvements, did you not?

Admiral McKEAN. Yes; and I just recall another case. I understand from the newspapers that there was a half a million put in for the completion of the submarine base at New London, Conn. This was on the carpet for some time, but they put it in yesterday, I believe.

Senator TRAMMELL. That has been recommended, some time ago.

Admiral McKEAN. Oh, yes, we needed that some time ago. I think the Secretary approved that from the beginning.

The CHAIRMAN. What bill is that in, the naval appropriation bill?

Admiral McKEAN. I understood from the newspaper—I read it this morning, I think—that there was an item for New London that had gone in. Somebody amended it, or something.

Senator TRAMMELL. It was amended by Senator Brandegee—\$50,000.

Admiral McKEAN. \$50,000?

Senator TRAMMELL. \$50,000.

Admiral McKEAN. No—

The CHAIRMAN. That was several days ago.

Admiral McKEAN. I am sorry. I thought it was \$500,000.

Senator TRAMMELL. I believe you stated in your direct testimony that until we entered the war the representatives of the department had sought information from the Allies; had tried to get as much information as they could; but the efforts were rather futile, did you not?

Admiral McKEAN. I have understood that, and the officers who were sent over, especially, got very little, and some of them got in the spirit that it was no use, and they came back. I do not blame them. They would not give it to us. They did not know what we were going to do. They were paying bitterly for their experience. Why give it to us for nothing?

Senator TRAMMELL. There were new developments, you might say, quite frequently, along, in the submarine menace, and our department was making an effort to get such information as it could, and really assist us in better equipping us for taking our part and our place later on if we should become involved?

Admiral McKEAN. Oh, yes; we ordered the submarine chasers, some of them, before the war commenced, and we had the plans approved, and we knew about where the contracts would go. We

had gotten that much ready for the submarine war, particularly. And out of the first emergency appropriation we got some of the moneys to speed up on the destroyers already under contract.

Senator TRAMMELL. If there was delay in getting ready for more effective service in opposition to the submarine menace, and anybody is to be blamed for that, the Allies might as well be blamed for not opening up and letting us know a little more, might they not, as to what could be done, and the preparation?

Admiral McKEAN. You see, Senator, I do not admit that there is any blame at all.

Senator TRAMMELL. I say if there was any?

Admiral McKEAN. If there was, it is equally fair to unload on them as it is on us.

Senator TRAMMELL. Do you know whether the department was asking for appropriations for more destroyers than Congress had appropriated for prior to 1916?

Admiral McKEAN. I think there were times, running well back, when Congress cut down our destroyer program. As I recall it, the General Board early adopted the ratio of 4 to 1—4 destroyers to every battleship—and I do not think we ever got up to that standard; and the General Board recommended from time to time, and the department recommended; but I do not think that Congress gave us authority as fast as we asked for them. I could not be sure of that. That would have to be checked up.

Senator TRAMMELL. I thought maybe you would remember. There was a table filed here which it is my recollection showed that the department and the secretary asked for more destroyers and other ships in 1914 and 1915 than Congress allowed.

Admiral McKEAN. That is my recollection of it, Senator, and that table will show exactly.

Senator TRAMMELL. In regard to the question of tugs, you began that in October, 1917; and from your statement I judge that there was not an appropriation available for that, unless the Secretary strained, if he did not even go beyond, his authority, to enter upon a program of tug building. Do you know when it was first taken up with Congress—the matter of getting authority for the tug program? I do not mean when it was acted on by Congress.

Admiral McKEAN. No; I do not, Senator. There was another type, you know. These were called seagoing tugs, which could not have been used for anything else. We got the mine sweepers first, which were of the tug type. They were authorized March 4, 1917. An order was given May 31. They were really seagoing tugs, but fitted for special purposes.

Then there was another lot authorized October 6, 1917. They were contracted for December 29. And just there, the authorizing by Congress did not mean that we could immediately make the contract. We had to do a good deal of bulldozing, sometimes, before we could get the shipbuilders to take the contracts. They had some chances at things that would pay a little bit better than some of our naval work, and you had to apportion it pretty fairly, and then say, "You will, or we will commandeer your yard." That was done numerous times. They were not rushing after naval contracts when they could get other contracts that paid better money.

Senator TRAMMELL. The demand for all kinds of equipment was so acute that you could not go out and find a contractor who was anxious to get a contract?

Admiral McKEAN. You had to sometimes build a yard.

Senator TRAMMELL. As a matter of fact, did not different branches of the Government—I am not sure as to the Navy Department—in order to encourage companies to take up construction of these different necessary equipments, have to advance money to them?

Admiral McKEAN. We financed numbers of companies, both to fit the plants for meeting our demands and in some places we financed new companies. I know one to which, if my recollection is correct, we gave \$9,000,000 of Government capital before we were through with it; they were using \$9,000,000 of Government capital.

Senator TRAMMELL. The department, after considering Admiral Sims's recommendations on different matters, with a broad view of the entire situation, if it approved of his recommendations, acted on them just as quickly as the facilities that were available permitted, did it not?

Admiral McKEAN. In all cases, so far as I know, after the decision was made and approved, they furnished the stuff as rapidly as the facilities of the country would permit, and our capacity. I do not know of any case in which that is not correct, so far as material was concerned. I do not know a single thing. I had special orders, for instance, in material, operations, to follow up and check every item of every dispatch that came from the other side; and every item, no matter which bureau was concerned, was followed until the material was on the ship, and then we closed that drive. It was a follow-up business that built up because some shipments had not gotten through. We followed the shipment from the day we got the order, even in material, until it was on the ship, routed to where Admiral Sims wanted it. That is only one illustration of what we were trying to do.

Senator TRAMMELL. As far as your knowledge goes, recommendations and requests that came from Admiral Sims were placed in the hands of the proper naval officer here for consideration with reasonable promptness, were they not?

Admiral McKEAN. In my opinion, I have always understood so. As Capt. Pratt explained, at first we had some difficulties about decoding, and so on; but I think we all got Sims's telegrams, and my recollection is that they were passed over the desks of the heads of divisions, and each of us initialed them; and we had a list, and we inserted them; and we gave them to those subordinates that we wanted that information to go to, and checked it to them, or extracted and checked to them, and I think that the information and requests of Admiral Sims, according to my recollection, were distributed, and to the people who should act on them as rapidly as practicable.

The CHAIRMAN. After they had been approved?

Admiral McKEAN. Sir?

The CHAIRMAN. After they had been approved?

Admiral McKEAN. Well, I think that they were information first, Senator, before the question of the approval. They would be for information. Then we would have a conference and discussion, and we would say "What are we going to do about Admiral Sims's request," and so forth. Then you would get an action order—

executive. They would say "Send so and so;" or "No, we will not do so and so"; or "Do so and so; and do this so and so." Now, I think as information—either requests or definitely information—it was circulated to all the people concerned, very promptly. That was the first thing most of us did in the morning. We would get up to date on the facts.

Senator TRAMMELL. And your bureau, you had to, or you did, at least, take into consideration the entire situation and all, in passing upon matters, and you could not restrict your decision to the needs on the other side only?

Admiral McKEAN. We had to take into consideration not only Admiral Sims's recommendations, but conditions over there. We had to take into consideration the conditions here at home. We had to take into consideration the conditions or needs of the War Department, the policies of the State Department, the condition of the material market, whether we could get this thing or whether we would have to substitute that, and all of those things, before we could decide that it was possible for us to comply with Sims's requests. But if it was necessary, then we bent every effort of everybody in the department to get that thing, and the material bureaus evidently were satisfactory, as I understand Admiral Sims has sent a complimentary letter to each chief of bureau; and I know that they were making every effort, and his stuff had the right of way, practically, with all of us.

Senator TRAMMELL. This letter of April 19, 1917, which was the first letter received from Admiral Sims after he went to London, in making reference to battleships, does not recommend or request that they be sent there, does it?

Admiral McKEAN. Not one.

Senator TRAMMELL. It does not do that?

Admiral McKEAN. No; it is apparently, the way I read it, a suggestion that it would be desirable to have battleships. That came from other parties. Some one had suggested that, and that he merely passed on what he said about it.

The CHAIRMAN. No one has suggested that it was in the letter of April 19.

Admiral McKEAN. Sir?

The CHAIRMAN. No one has suggested, I say, that that was in the letter of April 19.

Admiral McKEAN. No; but the letter of April 19 was the one which he laid down what he wished.

The CHAIRMAN. He kept asking for things after that.

Senator TRAMMELL. What letter was it supposed to be in?

Admiral McKEAN. It was suggested by somebody else.

The CHAIRMAN. In his cable of April 14, he said:

At present our battleships can serve no useful purpose in this area except that two divisions of dreadnaughts might be based on Brest for moral effect against anticipated raids by heavy enemy ships in the channel out of reach of British main fleet.

Admiral McKEAN. Yes, and he then refers to that as a suggestion. I have got it straight now. The language is "might be based on Brest for moral effect." He does not even recommend or request.

Senator TRAMMELL. He did not recommend it or request it, but merely stated that it might be worthy of consideration, at least; but he did not recommend it or request it.

The CHAIRMAN. He recommended it later on, very shortly afterwards.

Senator TRAMMELL. He might have recommended it later on.

Admiral McKEAN. I think he did recommend that some battle-ships be sent over later on. They were sent some time after his recommendation.

The CHAIRMAN. He recommended it in July, 1917, and he got them, I think, in December.

Admiral McKEAN. Late in the fall.

The CHAIRMAN. Is there anything more?

Senator TRAMMELL. I do not think I have anything more.

The CHAIRMAN. I referred in my questions a short time ago to certain memoranda and a letter submitted by Capt. Laning. I have the memoranda and letter here, if you will look at them.

Admiral McKEAN [after examining papers]. I have seen that. Now, the question of contracts, it was my recollection that there was some hitch with the contractors; but the details of those I know nothing about.

The CHAIRMAN. You simply handed it to him?

Admiral McKEAN. Brought it to the Admiral's attention. I read that memorandum, etc., and brought it to his attention, and I probably made recommendations, and so forth, as to its urgency, and asked him to prepare—that that ought to be looked up or followed up.

The CHAIRMAN. We will let this memorandum be put in the record at this point.

The memorandum referred to is as follows:

In reply address the Secretary of the Navy and refer to No. —.

NAVY DEPARTMENT,
Washington, April 12, 1917.

(Confidential.)

Memorandum. For the Secretary of the Navy.

1. I have to invite your attention to conditions so alarming to the safety of the country that in my opinion immediate steps must be taken to avert them. These conditions are reported by the Bureau of Ordnance's quarterly report "Preparedness for War." These serious conditions are summarized as follows:

(1) Shortage of shells, 14-inch caliber.

(2) Nonaward of contracts for 1,296 torpedoes required by the 1917 building program.

2. As the Navy stands to-day we have the following allowance of 14-inch shell on the battleships in commission having that caliber guns. These are the (1) *Arizona*, (2) *Nevada*, (3) *New York*, (4) *Oklahoma*, (5) *Pennsylvania*, and (6) *Texas*. Should these ships be called into battle and expend their ordinary supply of shells—which is only sufficient for a short battle—we have not on hand to-day sufficient reserve 14-inch shell to refill their magazines. The total reserve supply of 14-inch shells for refill is but 1,961, an average of less than 31 shells per gun. Furthermore, if this small reserve is used for refills there would be no shells at all available for the *Idaho*, *Mississippi*, and *New Mexico*, now well along to completion. I can not bring too strongly to your attention that without shells for the guns, battleships, and all they contain, are worthless. They not only can not defend themselves but can not even fight to save the country. To be without sufficient shells for our largest and best battleships exposes not only the Navy but the whole country to disaster. I most earnestly urge that the Chief of the Bureau of Ordnance be given authority and orders to provide sufficient 14-inch shells at the earliest possible time to fill out the allowance for the ships built and building and to complete the reserve stores essential for those ships.

3. While the situation as to 14-inch shell is dangerous, that with reference to torpedoes is none the less so. Our new submarines, Nos. 78 to 107, and destroyers, Nos. 75 to 94, are all being speeded to completion and will undoubtedly be required for service as soon as ready. Neither can be used unless they are equipped with the torpedoes they were built to use. Unless the contracts for their torpedoes are entered into at once the ships will be ready before their torpedoes are.

The price for the 1,296 torpedoes involved, which has been the cause of the delay in executing the contracts, has been adjusted and the contracts have been signed by by the E. W. Bliss Co. The price having now been satisfactorily arranged, it only remains to sign these contracts to start the work. It is earnestly recommended that the contracts be signed at once and the Bureau of Ordnance directed to have the work pushed to completion.

The CHAIRMAN. You have no recollection of that matter at all?

Admiral McKEAN. No, sir. I know there was such a case, but I do not recall what I did or what happened.

The CHAIRMAN. There is also a letter in regard to repairs to the fleet, signed by you, on the 18th of May, 1917. This is on page 976 of the record.

Admiral McKEAN (after examining paper). Yes; that is my memorandum.

The CHAIRMAN. Saying that there were a great many repairs that were necessary for the fleet at that time.

Admiral McKEAN. There were a good many of these longer repair shifts, 50 days, etc., that were alterations rather than repairs.

The CHAIRMAN. The memorandum shows in each case?

Admiral McKEAN. Yes, sir; it shows each one. Here are the details [indicating].

The CHAIRMAN. Can you now answer my question as to whether there was a delay in getting these forces in condition for service?

Admiral McKEAN. Evidently the delay was due to the fact that the commander in chief and the Chief of Naval Operations did not agree with my plans, and as to the urgency thereof. This would not go to the Secretary. This was decided by Admiral Benson, and the commander in chief, after consultation, and would be followed up by another statement which was put in effect later.

The CHAIRMAN. Yes, but it does indicate that the fleet was not in very good shape as to material, does it not?

Admiral McKEAN. Yes, but it was better than reading "40 days" or "50 days" would look. It does not mean that they were not in such condition that they could go abroad and go into a fight, and all that sort of thing. Here is the idea, to bring them up to the nearest to 100 per cent of efficiency they could. This is what we would have liked to have done.

The CHAIRMAN. It will not be necessary to put that in. A reference to the page of Capt. Laning's testimony will be sufficient.

Admiral McKEAN. It was not as bad as it would look from the number of days stated there. For instance, the *Wyoming* left the Bremerton Navy Yard the other day. She has not, I think, arrived at San Pedro, but when I get back there Capt. Evans will have things he would like to have done.

The CHAIRMAN. I think that is all Admiral, and you may be excused.

Admiral McKEAN. Thank you, sir.

(Thereupon, at 1.40 o'clock p. m., the subcommittee adjourned until Tuesday, May 4, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

TUESDAY, MAY 4, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

TESTIMONY OF ADMIRAL W. S. BENSON, UNITED STATES NAVY, RETIRED.

(The witness was sworn by the chairman.)

The CHAIRMAN. Admiral, have you any statement to make in connection with this investigation?

Admiral BENSON. I have not, Mr. Chairman; I have not prepared a statement. I felt that my aides had covered all of the details with reference to the office of Operations, and the questions of policy, and so forth, that actuated what was done by the office of Operations. I am prepared to answer any questions in regard to that. I have intentionally avoided preparing a studied statement. I have attempted to keep my mind as free as possible from any of the influences that might have been produced by hindsight, or a study of the problems involved after they had been solved, knowing from the nature of the investigation and feeling that that was what was wanted, I tried to keep my mind unprejudiced by any subsequent study of the problems; and my memory is quite clear in regard to the main principles.

The details I have left to my subordinates to present to the committee, which I understood would be the plan followed.

I feel that I should make this statement, that as the naval advisor to the Secretary of the Navy, I was responsible for the naval operations of the war.

The CHAIRMAN. Will you state to the committee, Admiral, what your duties were from the time of the commencement of the World War up to the present time?

Admiral BENSON. I assumed the office of Chief of Naval Operations on the 11th of May, 1915, and held that office until my retirement on the 25th of September, 1919.

My duties were, of course, as I say, as the chief or principal naval advisor to the Secretary of the Navy, in all matters with reference to the preparation of the fleet, the organization of the fleet, and preparation of the fleet, for the purpose for which it is intended, for war, and those duties I performed during that time.

In 1917, for two months, nearly, from the latter part of October until the middle of December, I was abroad with a special mission that was sent abroad; and again, in 1918, from the middle of October until the 20th of the following June, I was abroad with a mission; and later on, as naval advisor to the Peace Conference in Paris.

I returned to the United States on the 30th of June, 1919, and resumed my duties in Washington; though while in Paris, I still, as far as possible, performed the duties of Chief of Naval Operations.

The CHAIRMAN. Before you became Chief of Operations what was your position?

Admiral BENSON. I was commandant of the Philadelphia Navy Yard.

To go back a little further, I put the *Utah* in commission in 1911, and commanded her until 1913, when I went to the Philadelphia yard as commandant, and remained there until I came to Washington on the 11th of May, 1915.

The CHAIRMAN. When were you promoted to the grade of rear admiral?

Admiral BENSON. When I was made Chief of Naval Operations. That carried with it the rank of rear admiral; and when I was regularly promoted I really could not say, Senator. I have forgotten, sir.

The CHAIRMAN. You were not rear admiral, you say, when you were made Chief of Naval Operations?

Admiral BENSON. My regular rank was captain; but the office carried with it the rank, while so acting, of rear admiral, and then the bill that passed in 1916, I think it was, raised the rank to full admiral, ranking after the Admiral of the Navy; and when my regular promotion came from captain to rear admiral, I really could not say.

The CHAIRMAN. Were you flag officer at any time?

Admiral BENSON. I was acting flag officer during the time I was in command of the *Utah* for a while. I took the first division south in 1913, and commanded it, I think for several months; just how long, I have forgotten. It was the one that Admiral Winslow was regularly in command of, and by reason of the fact that I was the senior captain in the division I assumed command of it.

The CHAIRMAN. While you were with the *Utah*, you had sea service, of course.

Admiral BENSON. Yes; I was regularly at sea for practically two years.

The CHAIRMAN. And that was your last sea service?

Admiral BENSON. That was my last sea service. That ended on the 25th of June, 1913.

The CHAIRMAN. Prior to your command of the *Utah* what had been your duties?

Admiral BENSON. Before that I had—well, just prior to that I was in command of the *Missouri*, one of the older battleships.

The CHAIRMAN. For how long was that?

Admiral BENSON. I think only three or four months. I came from the Pacific. I was chief of staff of the Pacific Fleet. I went out to the Pacific in 1908 in command of a cruiser, and then was promoted on the station, and became chief of staff to the fleet out there and remained there until the latter part of February, 1910, when I came East and was on the examining board here for a couple of months, and then went in command of the *Missouri*, commanded her

until August or September, or about that time, 1910, when I was ordered to duty in connection with the fitting out of the *Utah*.

Previous to that I had been commandant of midshipmen at Annapolis.

Previous to that I had been lighthouse inspector of the sixth lighthouse district.

Previous to that I had been executive officer of one of the battle-ships of the fleet.

The CHAIRMAN. That was when?

Admiral BENSON. 1903. It was 1905 when I was executive officer of the *Iowa* in the Atlantic Fleet.

Previous to that I had been on duty at Annapolis as senior assistant to the commandant of midshipmen.

Previous to that I had been flag lieutenant to the commander-in-chief of the Atlantic Fleet, and had been a watch officer on one of our ships cruising in the West Indies and around Africa.

Previous to that my duties had been as a watch officer at sea, or watch division officer, with one or two tours of duty at Annapolis.

Altogether, I have had about twenty-two and a half years of sea service. I think I have had twenty-two and a half at least.

The CHAIRMAN. But from June, I think it was you said, 1913—

Admiral BENSON. June, 1913.

The CHAIRMAN. Up to your retirement, your duties were land duties.

Admiral BENSON. Shore duty.

The CHAIRMAN. Shore duty?

Admiral BENSON. Except when I was with the fleet as Chief of Naval Operations.

The CHAIRMAN. Do you consider the United States as a neutral nation was debarred from preparing its navy for war between 1914 and 1917?

Admiral BENSON. I do not, sir.

The CHAIRMAN. Did not the sinking of the *Lusitania*, followed by other attacks upon the ships of Americans, justify us in preparing for war against Germany?

Admiral BENSON. That of itself I should not say that it would.

The CHAIRMAN. What?

Admiral BENSON. I should say that alone would not.

The CHAIRMAN. Would not justify us in preparing for war?

Admiral BENSON. No.

The CHAIRMAN. When did you first conclude there was danger of our being drawn into this war?

Admiral BENSON. I felt it as soon as war was declared in Europe. It was my firm conviction that sooner or later the United States would be drawn into war with Germany, whether it was with the Allies, or after the war with the Allies was completed; but I felt absolutely certain in my own mind, that sooner or later we would have to fight Germany. I had the conviction. In fact, I felt that conviction even before the war started in 1914; and after it did start I felt that it was sure, because, if I may state it here—and I suppose it is pertinent to the question—I felt very apprehensive, from the beginning of the war, of its final ending, and I felt as firmly as I could under the circumstances that sooner or later we would have to fight Germany.

The CHAIRMAN. Did you not then feel that we were justified immediately after the World War started, in preparing our Navy for war?

Admiral BENSON. From the professional standpoint, I should say yes; but from the attitude of mind of the people of the United States I should say no.

The CHAIRMAN. When did you first feel that we were justified in preparing for war?

Admiral BENSON. As I have just said, from my professional standpoint I would have been prepared for it all the time.

The CHAIRMAN. But from the standpoint of the people of America when did you first feel that you were justified in preparing for war?

Admiral BENSON. I think about the time that Congress decided to declare war.

The CHAIRMAN. April 6, 1917?

Admiral BENSON. Yes.

The CHAIRMAN. And not before?

Admiral BENSON. Not from the attitude of the people of the country; no. But I want it distinctly understood that that is not my professional opinion.

The CHAIRMAN. Did you inform the Secretary of your professional opinion that there was danger of our being drawn into the war?

Admiral BENSON. To the best of my recollection, I did.

The CHAIRMAN. When?

Admiral BENSON. I could not state that. I might go back and state what, as Chief of Naval Operations, I found when I came to Washington and what I did in filling that office to carry out my view.

As I said just now, I assumed the office on the 11th of May, 1917. I found absolutely nothing in my office that was of any service to me. Even the office into which I came was not in proper condition even for an officer of my rank and the position I held. That was about all there was to it; a room in the Navy Department, and I think one or two small rooms outside for clerical help. Of course the General Board had been functioning in its normal and proper way, and the general plans for war that had been worked out by the General Board existed, and certain studies had been made, certain regulations drawn up in regard to communications.

As near as I can recall it now, that is practically all I found in the way of preparation. I immediately took steps to ascertain the conditions of the various bureaus of the department and their readiness for war. The General Board had already taken up the subject, short while before, and I think on the 28th of May the letter went out, the order to the bureau chiefs, to report at a certain time their readiness for war, and report any features in which they were not prepared for war, and periodically after that they had to make reports of progress made in getting their bureaus in shape.

An immediate study was begun with the General Board, of which I was a member, and at my request to study and prepare a proper organization for the whole fleet. That was carried through and was finally completed, and after approval by the Secretary it was put into force. It was an organization that carried us through the war and proved successful in every particular.

The CHAIRMAN. When was that done?

Admiral BENSON. In 1915, soon after I assumed the office of Chief of Naval Operations.

In addition to that the inspection board was increased in numbers so that all of the vessels that were suitable as auxiliaries, or for such purposes as they might be needed for in time of war, were carefully inspected; but before the inspections took place the General Board had very carefully studied out and we had outlined the exact requirements for each type of vessel, such as refrigerators, transports, colliers, and mine layers, or whatever we wanted to use them for. All the details were carefully worked out.

This list of requirements was given to the board of inspection. They inspected every vessel that we had, and each one, as it was inspected, after comparison with the requirements of the particular type, was assigned to that particular duty in case of war; the yard to which she would go to have the necessary alterations made was assigned; and a list of the equipment that would be necessary was made out, and a copy furnished to the bureau concerned and to the yard concerned.

A statement of the changes that would be necessary to be made in the way of alterations was given to the bureaus concerned, and they were required to make the necessary plans and to have them at the navy yards, and as fast as the funds were available this various equipment was ordered to be gathered and collected at these various yards so that in case of war there would be no delay in putting these vessels into operation. That was carried out very successfully. There was not exactly a mining division, but an officer was assigned to take up the question of preparing mines and vessels to exercise and be prepared for mine work.

The naval districts were organized, and an organization worked out for the naval districts, and the way in which these various districts would be handled in case of war, and what would be necessary to do was also worked out.

In the system of communication, as I said just now, quite a careful study had been made in regard to communication, and this study put in proper shape in the way of rules, and the general system was approved soon after I assumed the position of Chief of Naval Operations, and this was constantly improved and the facilities were increased; and I do not remember now whether it was in 1915 or 1916 we mobilized all the communication systems in the country. They gave us, I think it was, 30 hours in which they turned over the telegraph and everything to the Navy Department, and I was able in my office to communicate by telephone and otherwise immediately to every one of our stations on this coast and to one or two on the other, and the Secretary of the Navy was able to communicate by wireless radio with a ship at sea. The leading men and experts of these various companies came to Washington, watched very carefully what was done, and gave us memoranda of what we should do in order to increase the equipments and be prepared in case we had to use them for war purposes. This equipment was all carefully catalogued and the room in which it was to go was marked. The position it was to occupy was marked. By degrees the switchboards were increased in capacity, and every means was taken to be prepared with the communications.

The law which required the other departments, such as the Coast Guard, Coast Survey, etc., that automatically came under the Navy Department in time of war, was passed. Joint boards were ordered,

and every detail that could be worked out beforehand was worked out, to see that when war was declared they would move one into the other, or that regulations would not conflict and there would be no delay in their taking up their duties at once.

The questions of hospitals and of prisons, even, and who should control prisoners, and everything of that kind, was carefully worked out.

The question of the extra supply of powder, of ammunition and torpedoes, and practically everything connected with the preparation of the Navy Department for war, was carefully followed up, and everything was done that could be done with the means that we had at our disposal.

A small appropriation was gotten through in 1916, even anticipating the fact that we would want to put guns on those auxiliaries and extra appropriations or allowances were made to meet the extra demands that had been made for the preparation of powder and torpedoes and various additional equipment that would be needed. That was carried, I believe, as far as was possible, so that everything that the Navy Department had control of at the time was prepared and every possible step was taken short of mobilization of the fleet that could be taken, to prepare the equipment that we had and to, as far as possible, prepare additional supplies, to get ready. That I considered to be my function, and it was accomplished; and as far as possible, it was done without any unusual display and without any opposition from anybody.

The CHAIRMAN. This was all prior to April 6, 1917?

Admiral BENSON. Prior to our going into the war; yes, sir.

The CHAIRMAN. It was the base plan, was it?

Admiral BENSON. I was saying that I felt from the beginning that we would have to go into the war, and I have enumerated the steps I took to prepare in case we were to get into the war.

The CHAIRMAN. But you have stated that in view of the attitude of the American people we were not justified in preparing to go into the war prior to the time we actually did go into the war?

Admiral BENSON. I did; and I would still repeat that. But I would say this, Mr. Chairman, that we have a Navy, and the function of that Navy is to keep it prepared for war, as nearly as possible, all times. That is what I understood that to be.

The CHAIRMAN. This was just a general peace plan, was it?

Admiral BENSON. A general peace plan to be prepared for war with everything we have got. That is the function of the Navy, and when the Navy fails to have every part of its equipment and every vessel prepared for war, it is failing in its function, and I felt that to be my duty, and I carried it out.

Senator PITTMAN. Will you excuse me, Mr. Chairman; I desire to be excused from this hearing for a short time. I want to apologize to the committee and to Admiral Benson for being compelled to go but there is a very important meeting of the Foreign Relations Committee that I must attend. I hope to be back in a very few minutes.

(At this point Senator Pittman left the hearing.)

The CHAIRMAN. Then, Admiral, had the world not been engaged in war subsequent to the time when you went in as Chief of Naval Operations, and prior to our going into the war, you would still have done the same thing?

Admiral BENSON. Absolutely; I would have done the same thing, yes, sir, because I feel that that is what should be done.

The CHAIRMAN. Yes.

Admiral BENSON. But I do not wish to avoid the fact that I was strongly impressed, and possibly used more energetic action because I felt so sure we would get into the war; but I feel that I should have done it anyway. If I went back into that office to-day, for instance, I would feel the same thing.

The CHAIRMAN. So there were no special plans made that had to do with war of the kind we got into.

Admiral BENSON. With the particular war that we got into. I say I did feel that we would get into it, and we may have increased the supply of ammunition or something of that kind more than we would have done.

The CHAIRMAN. Do you feel that you went further in those plans than you were justified in going?

Admiral BENSON. I do not, sir.

The CHAIRMAN. After the German ambassador was given his passports in February—I think it was February 2, 1917—was it not very evident that we were sure to get into the war?

Admiral BENSON. As I have said, I felt all along that we would. That phase of the question from that on was a political one that I had nothing to do with.

The CHAIRMAN. But it was practically certain we would get into the war after the German ambassador was given his passports, was it not?

Admiral BENSON. I think it was; yes, sir. I felt it all along.

The CHAIRMAN. And yet you think we were not justified in taking any special steps between that time and April 6, 1917, to make any special preparations for war with Germany?

Admiral BENSON. I say the feeling of the people was such, as I understood it. Professionally I felt we ought to have been prepared for war long before.

The CHAIRMAN. But from the feeling of the people you think we ought not to have made any special preparations?

Admiral BENSON. As I can recollect it now; yes, sir.

The CHAIRMAN. You say you informed the Secretary of your belief that we would get into the war, but you do not recall when you informed him of that?

Admiral BENSON. No, sir.

The CHAIRMAN. Immediately on your appointment as Chief of Operations?

Admiral BENSON. I felt so all along, and I must have said it from time to time; but I do not wish to be put in the position, Mr. Chairman, of putting any blame on the Secretary of the Navy for lack of preparation for war.

The CHAIRMAN. You have already answered questions about your own belief and your actions, you know.

Admiral BENSON. Yes, sir.

The CHAIRMAN. No matter what conclusions may be drawn from the questions.

Admiral BENSON. Yes.

The CHAIRMAN. And you repeatedly informed the Secretary of your professional belief that we would get into the war?

Admiral BENSON. I do not know that I would put it that way; whether I did or not. That is a question that I could not answer exactly as you want it. I could not say positively whether I did or not.

The CHAIRMAN. Your relations with the Secretary were very close, were they not?

Admiral BENSON. Yes, sir.

The CHAIRMAN. If you had this professional belief about our getting into the war, is it not probably that you would have made it manifest on numerous occasions?

Admiral BENSON. Oh, I think that I did. That is my belief that I did.

The CHAIRMAN. Did you advise the Secretary to prepare for war?

Admiral BENSON. Well, I must have done it, Mr. Chairman. Just at what time and in what way, it would be difficult for me to answer that question. I felt it strongly, and I felt my responsibilities and my duties, but just to what extent I expressed them, it is impossible for me to say now. From time to time I did the duty that came to me; I realized that I was responsible for the situation and did everything that I felt it was my duty to do with reference to it. I can not answer your question in any more detail than that.

The CHAIRMAN. You do not recall especially advising the Secretary to prepare for war?

Admiral BENSON. No; I do not.

The CHAIRMAN. At any time?

Admiral BENSON. No; I do not.

The CHAIRMAN. In view of your feeling that on account of the attitude of the American people we were not justified in preparing the Navy for war, do you think we would have been justified in preparing plans for the Navy in case of war?

Admiral BENSON. We had plans in case of war. As I stated in the beginning, the General Board had plans that had been studied. We had several plans. We had our battle plans that were very confidential, and particularly for any operations in the Atlantic. We had plans, that were developed up to a certain extent, in the Pacific. There were certain phases of the Pacific situation that were not fully developed, and they are not fully developed in some respects now. But as far as it was possible, they were developed. The Atlantic Fleet had been drilled in the battle plans that we had, for several years. As commanding officer of the *Utah*, I frequently took part in the general battle plans that we had, and they were worked out on the game board at Newport, at the War College, and most officers were supposed to be familiar with the plans that we had.

In regard to the war that was facing us, the situation was a very peculiar one. I appreciate the emphasis that has been laid on the question of plans, and I think that possibly it has played a part that really is not altogether just to the situation. For instance, we did not know that we would be drawn into this war with the Allies, but if we were drawn into the war with the Allies we would have to enter it in the way in which they wanted us to enter it; that is to say, that our forces would have to be combined with their forces in the way that would carry out the plans and policies that they had set out and had been following for the past three years in carrying on the war. It would be utterly impossible for the United States to

have sent a naval force into the European waters without carrying out a policy or plan of that kind, because we would have had no place to base our vessels or to exercise an absolutely independent command, and we would simply have complicated the situation by attempting any such line of action; so that the only thing to do was to get, as we did, what we had in the best condition possible, and be prepared to enter the war in such a way as would develop when the time came.

The CHAIRMAN. Without any prearranged plans?

Admiral BENSON. Plans of what kind? That is a plan in itself.

The CHAIRMAN. Specific plans for the use of the Navy in the war with Germany.

Admiral BENSON. Well, in a way that is a plan in itself; that is, that we would get everything ready and be prepared as well as we could with what we had to combine with the Allies in their policies and plans that they might have when we joined with them, and would in that way get the plans and policies that they were carrying out. I did not know, nor did anyone else on this side know, the details of any plans or policies that the Allies were carrying out.

The CHAIRMAN. But without any special plans as to how we would use our battleships and destroyers or submarines or aircraft or screening vessels in the war?

Admiral BENSON. Those plans were all clearly laid down in our battle plans.

The CHAIRMAN. In the old peace battle plan?

Admiral BENSON. If you call it a peace battle plan.

The CHAIRMAN. The old plan that was ready in time of peace for any war that might come up?

Admiral BENSON. Yes; of course we were studying the development of aircraft and the best method of using them all the time. Of course, that was something new, and we were developing that as fast as we could.

The CHAIRMAN. But there were no especial changes that had been made in the old plans to which you have referred, prior to our going into the war?

Admiral BENSON. Only in a general way; mobilizing the fleet, and, for instance, the General Board had drawn up a plan in which they expressed their views that we should mobilize the fleet at a certain place, and what we should do with the different vessels. That plan had been drawn up in a general way and submitted to the department.

The CHAIRMAN. When?

Admiral BENSON. That I could not tell you, what date that was done.

The CHAIRMAN. Was that the plan that was submitted immediately before the war, which was lost?

Admiral BENSON. I could not say whether that was it or not, sir. I can not go into the details, Mr. Chairman; but I remember that we did get plans of that sort from the department. For instance. in - case—

The CHAIRMAN. But you can remember whether it was immediately before the war or not, can you not?

Admiral BENSON. Yes; just before the war.

The CHAIRMAN. Immediately before the war?

Admiral BENSON. Within a month or two, yes, sir; possibly nearer than that.

The CHAIRMAN. Do you recall what became of that plan?

Admiral BENSON. I do not.

The CHAIRMAN. Or whether it was adopted?

Admiral BENSON. It was adopted in general principle. As a matter of fact, the general policy that we would base a plan on was discussed, and then when it was decided that we would follow a general policy the plans were drawn up to meet the policy, and frequently, in what I had to do, I had the idea and policy in my own mind. The plans were worked out principally for somebody else to follow, so that I did not give quite the attention I might, personally, to the development of plans or to their execution. That was the duty of some one else. But I do know that plans of that character were submitted to the department.

The CHAIRMAN. And was that for the case of a war with Germany — for the special case of a war with Germany?

Admiral BENSON. Yes; we got, for instance, like this coming from the General Board, recommending that the fleet be brought north, and mobilized in the lower Chesapeake, and that certain other things be done; that vessels be sent to navy yards and that certain things be done to them; which I think would answer the question you asked. Whether that came as a general plan or simply as a recommendation it would be difficult for me to state definitely; but we did get such recommendations and put in very definite, concrete form, and it was as regards what should be done with the vessels of the fleet in the way of repairs, etc., in order to be prepared for the war if it came.

The CHAIRMAN. How do you distinguish between a recommendation and a plan? The committee has not been able to get very definite testimony from witnesses as to just what constitutes plans.

Admiral BENSON. It is a little difficult to draw a very careful distinction, except that a plan of operations, for instance just what would be done with the fleet—the various elements of the fleet—in case certain operations are to be performed, would be drawn up. That would be a plan. Then a recommendation would be a statement, coming from, say, the General Board, outlining the general features of this plan, and recommending that it be carried into effect and executed.

The CHAIRMAN. In order to become a department plan it would have to be approved, would it not?

Admiral BENSON. Yes; it would have to be approved.

The CHAIRMAN. So that no recommendation or plan of any kind becomes a department plan until it is approved?

Admiral BENSON. Not until it is approved; no.

The CHAIRMAN. Admiral, in view of your own statement that on account of the attitude of the American people it would not have been proper to prepare the Navy for war before April 6, 1917, I will ask you whether you think that it would have been proper to make plans for the war and have them all ready before April 6, 1917.

Admiral BENSON. Anything that we would have done, Mr. Chairman, in the way of plans before we actually went into the war, further than a plan of mobilizing the fleet and the method in which the vessels should be sent to yards, etc., for repairs, in my mind

would have been nothing more than, you might say, an academic study. That was my view of it then, and it is my view of it now.

The CHAIRMAN. Admiral, would it have been an academic study if the Navy Department had made a thorough investigation of all of the shipping of the country that might be used in case of war, and had prepared a plan to commandeer those ships, and to have equipment ready to put on them immediately on the declaration of war? Would that have been an academic study?

Admiral BENSON. That was done, Mr. Chairman, as I stated.

The CHAIRMAN. Was that done?

Admiral BENSON. We actually did that as far as it was possible with what we had. I stated that the inspections board was increased in number, and that every vessel was listed and a careful study made of the requirements for each ship; and as each vessel was inspected it was assigned to its particular type and it was assigned to the navy yard where it would have its alterations and preparations made; and so far as the appropriations would admit, the necessary equipment, such as signal apparatus, searchlights and everything of that kind, was prepared and placed at the yards ready for that.

The CHAIRMAN. Then a plan of that kind would not be an academic plan?

Admiral BENSON. No; if you call that a plan, it would not. I was not thinking of that particular feature of it.

The CHAIRMAN. And that sort of plan you actually did draw up?

Admiral BENSON. We actually did it. As a matter of fact, I did not study that out. I gave the order to do it and it was done.

The CHAIRMAN. Were you justified in doing that, if you were not justified in preparing the Navy for war?

Admiral BENSON. Certainly.

The CHAIRMAN. Why?

Admiral BENSON. Because that is a function of the Navy. There is no other reason for its existence.

The CHAIRMAN. It is a function of the Navy to be prepared for fighting, is it not?

Admiral BENSON. Yes.

The CHAIRMAN. And yet you say we were not justified in preparing the Navy for fighting?

Admiral BENSON. I made a distinction, Mr. Chairman. I said with what we had. What I mean is, we would not have been justified in making unusual preparations such as were made immediately after war was declared.

The CHAIRMAN. Is not that an unusual preparation, to prepare to take over a large number of ships?

Admiral BENSON. No, sir; I would feel that I was neglecting my duty if, as Chief of Naval Operations, I did not have all of that data ready.

The CHAIRMAN. And you feel that at all times we are justified in having all of that data?

Admiral BENSON. Absolutely; and not only justified, but that we would have been negligent if we did not have it.

The CHAIRMAN. Now did you, as a matter of fact, have a plan to utilize all of the vessels of the country that might be used during the war by the Navy?

Admiral BENSON. In case we had to meet an enemy fleet, we did have such plan.

The CHAIRMAN. Then after April 6, 1917, you could have taken over at once all of these vessels with regard to which you had prepared?

Admiral BENSON. If we had had the authority, we could.

The CHAIRMAN. If you had had the authority?

Admiral BENSON. If we had had the authority. You know, we did not have the authority to take them over until sometime in June; I think it was the 15th of June before we got authority to take them over.

The CHAIRMAN. If, when war was declared, the department had asked for that authority at once, is there any question but what they would have gotten it?

Admiral BENSON. That I could not say. I know that we did not get it, and it was pending for some time.

The CHAIRMAN. Was any such request made to Congress, to your knowledge, by the department?

Admiral BENSON. That I do not know, sir.

The CHAIRMAN. In any event could you have prepared the Navy for war without the consent of the Secretary of the Navy?

Admiral BENSON. No, sir.

The CHAIRMAN. I have asked you what advice you gave to the Secretary about preparing the Navy for war. Did the Secretary ever give you any definite instructions with regard to active preparation for war, in regard to personnel, material, or organization, prior to the declaration of war?

Admiral BENSON. Not as a definite preparation for war; I do not think he did. I can not recollect his having done so.

The CHAIRMAN. Did he ever hold you up or delay you in any way when you were seeking to make any such preparations?

Admiral BENSON. Well, it depends upon how far you mean. I think this: I think that the Secretary was very careful to go over the recommendations that were made to him, and that he gave very careful consideration to matters pertaining to any increases in expenditures and things that might involve unusual outlay, and there were delays in that way; but I do not think there was anything I could state definitely that you might call a holdup, except that there were many things that I felt, as a naval officer, that we ought to do; that he felt as a policy we ought not to do. But in what we had, with the facilities we had, I do not think that he ever interfered with getting them ready, as far as we could, for war.

The CHAIRMAN. You say that there were many things you thought ought to have been done. To what do you refer, for instance?

Admiral BENSON. Well, I would have been glad to have seen a larger number of the smaller guns prepared for going on the auxiliaries.

I would have been glad to have seen the ships in reserve fully manned and preparations made so that in case of war we could not only have manned the ships in reserve at once but the auxiliary vessels and things of that kind.

I would like to have seen more active steps taken to prepare our powder supply and things of that kind. But we had a large surplus of that, and due to the situation that the chances were that we would not have to meet the enemy fleet at an early date, and the world

condition, and the other big expenses that the Government was meeting, that it was policy to delay those things until later; and subsequent events justified the delay in those cases.

The CHAIRMAN. How do you mean, delay them until later; until we had gotten into the war?

Admiral BENSON. Yes; until the immediate situation was better provided for.

The CHAIRMAN. And you think that subsequent events justified those delays?

Admiral BENSON. Yes; I think so.

The CHAIRMAN. Why?

Admiral BENSON. Because we did not need them.

The CHAIRMAN. That is, if they had all been done before we went into the war we would have been better prepared when we went into the war?

Admiral BENSON. I do not quite get your question.

The CHAIRMAN. That is, if those matters which you wanted to have done and which were not done, had been done, and we would therefore have been better prepared for war, you think it would have been a good thing?

Admiral BENSON. No; I did not say that, and I do not want to be understood as saying that.

The CHAIRMAN. Well, I do not want to misrepresent you. I want to know if you think that.

Admiral BENSON. No; I said as a naval officer I would have been glad to have had them ready, but I think that the Secretary——

The CHAIRMAN. You said that subsequent events justified him in not getting them ready?

Admiral BENSON. Yes; because we did not use them.

The CHAIRMAN. Then they were not things that would have been of use in the war?

Admiral BENSON. Of course, there were a lot of things we did not use, but I would have gotten them ready, just the same; and we have got to. We are doing that all the time. We have lots of things in the Navy that we wear out from year to year, and——

The CHAIRMAN. But did you not make recommendations about preparing some things for the Navy that would have been of use in the war?

Admiral BENSON. Yes.

The CHAIRMAN. Were they all adopted at once?

Admiral BENSON. No; I do not think so.

The CHAIRMAN. Would it not have been better if they had been adopted at once?

Admiral BENSON. Yes; I think so.

The CHAIRMAN. Then subsequent events did not justify delay in regard to them?

Admiral BENSON. Yes; I think they did, because we did not—I am trying, Mr. Chairman, to distinguish between my own position as a naval officer and the attitude of the Secretary as the official head of the Navy.

The CHAIRMAN. Then what do you mean by saying that subsequent events justified him in not preparing——

Admiral BENSON. Just what I say. We did not use them.

The CHAIRMAN. Then I ask you if you did not recommend some things that you did have to use later in the war, some things that were turned down by the Secretary?

Admiral BENSON. Yes. For instance, the question of the personnel. I think we were a good deal short on personnel.

The CHAIRMAN. Do you think subsequent events justified and bore out the Secretary on that?

Admiral BENSON. No; I did not say they did.

The CHAIRMAN. Then I do not see how that tallies with your statement.

Admiral BENSON. I did not make an unconditional statement. I referred to the supplies, especially.

The CHAIRMAN. Then in certain cases events——

Admiral BENSON. There was the question of personnel, particularly. There may have been others. But it is impossible for me, Mr. Chairman, to answer questions of that character in such detail. I am trying to make a plain, honest statement of the situation as it was.

The CHAIRMAN. Then you would say that in certain cases subsequent events justified the Secretary in not doing things, but in certain other cases subsequent events did not justify the Secretary in not doing them?

Admiral BENSON. Yes; of course, I think there were certain things that were not justified, if that is your point. There were.

The CHAIRMAN. Yes.

Admiral BENSON. I was referring at the time to particular ones. There were things that I think we were not justified in not being prepared on, and personnel particularly.

The CHAIRMAN. Yes. You say that from the very start of the war, professionally, you thought we would probably be drawn into the war?

Admiral BENSON. I did.

The CHAIRMAN. Did the Secretary have the same feeling?

Admiral BENSON. I do not think he did. Of course, I do not know what the Secretary thought, but I do not think that he did.

The CHAIRMAN. From your observation of him, when did he first have the idea that we would be brought into the war?

Admiral BENSON. That would be impossible, Mr. Chairman, for me to express that.

The CHAIRMAN. Did he, subsequent to the sinking of the *Lusitania*, so far as you know?

Admiral BENSON. I can only answer that in this way: I do not know whether the Secretary thought we would be drawn into the war before war was declared or not.

The CHAIRMAN. You do not know, at any time before that?

Admiral BENSON. I do not know at any time whether he thought so or not.

The CHAIRMAN. There was nothing that indicated to you that he did think so up to that time?

Admiral BENSON. No, sir; not to the best of my recollection, after three years.

The CHAIRMAN. If you had been ordered and permitted to begin preparations for war after May, 1915, would not the Navy have been better prepared that it was in April, 1917?

Admiral BENSON. Yes, sir.

The CHAIRMAN. Would you say that the Navy was in all respects prepared for war in April, 1917?

Admiral BENSON. It was not.

The CHAIRMAN. Would you say that the statement in the Secretary's annual report that the Navy was from stem to stern ready for war in April, 1917, was justified?

Admiral BENSON. Not from my point of view, no.

The CHAIRMAN. Was its personnel adequate?

Admiral BENSON. No.

The CHAIRMAN. Were all the ships ready?

Admiral BENSON. They were ready as far as—no, they were not all ready.

The CHAIRMAN. Were they fully manned?

Admiral BENSON. They were not fully manned.

The CHAIRMAN. Was the Navy mobilized?

Admiral BENSON. It was not.

The CHAIRMAN. Were there any scouts or screening vessels with the battleship force when it came north?

Admiral BENSON. There were some.

The CHAIRMAN. Previous to the war?

Admiral BENSON. There were some destroyers. I have forgotten how many. Not very many. I will say that it was not properly screened.

The CHAIRMAN. And do you consider scouts and screening vessels as of importance?

Admiral BENSON. Yes.

The CHAIRMAN. Why were not these vessels with the fleet?

Admiral BENSON. Because at the time that we went into the war, up to that time, if you remember, it was strongly impressed upon everyone to observe a strict attitude of neutrality, and it was necessary for us as a neutral—we were compelled to carefully guard the principle of neutrality, and our vessels were scattered throughout the world, and for that purpose I would say they were fairly well placed for guarding the neutrality that the United States had to observe.

The CHAIRMAN. To-day, should a battle fleet be provided with scouts and screening vessels?

Admiral BENSON. Yes.

The CHAIRMAN. At all times, in peace, should a battle fleet be so prepared?

Admiral BENSON. Yes.

The CHAIRMAN. Then why do you say that on account of the loss of neutrality we could not prepare our battle fleet as it should be prepared in time of peace?

Admiral BENSON. Because we did not have the vessels to do it.

The CHAIRMAN. Then it was not on account of neutrality—

Admiral BENSON. And they were scattered in all parts of the world, and we did not have an ample force to move a well-balanced fleet—we did not have a well-balanced fleet and we were not in position to do it.

The CHAIRMAN. Then it was not on account of loss of neutrality; it was on account of our not having the vessels to put there, was it?

Admiral BENSON. I thought you were asking me, Mr. Chairman, in regard to what we actually had. My answer was, in answer to that phase of the question, in regard to what we had. We could not bring them to it.

The CHAIRMAN. But you said that we could not bring them home on account of the loss of neutrality.

Admiral BENSON. I said that we could not. I said they were better placed for that purpose, and we did not have enough to properly screen the fleet. We did the best we could with them.

The CHAIRMAN. Perhaps I misunderstood you. I thought you said that on account of the loss of neutrality we could not gather together those vessels at that time.

Admiral BENSON. No; I think I stated that we had to guard our neutrality, and as the vessels were distributed throughout the world, they were very well, or fairly well, I said, distributed for that purpose.

The CHAIRMAN. How do you mean, guard our neutrality?

Admiral BENSON. For instance, we had to have vessels in the Pacific; we had to have them in the Far East; and we had to have them all along the coast; and we had to have destroyers here on our east coast, particularly.

The CHAIRMAN. What do you mean by guarding our neutrality?

Admiral BENSON. To see that it was not violated; that the vessels were not doing things contrary to the laws of war that neutrals have to observe.

The CHAIRMAN. I think I may have misunderstood it. I thought you said that on account of the loss of neutrality we would not have been justified in getting our vessels together.

Admiral BENSON. No; I did not mean that. I meant that we had to safeguard our own responsibility, but we did not have enough, and, in fact, we never have had.

The CHAIRMAN. But, of course, we should have had all the vessels we did have ready for such a purpose, should we not?

Admiral BENSON. As far as possible, we should have.

The CHAIRMAN. And did we have them so ready?

Admiral BENSON. No; I do not think they were all; but, as you remember, the ships were cruising; those that were in full commission were cruising. The vessels had been kept cruising, and in the summer of 1915 and 1916 they were kept as completely ready as possible. We had maneuvers in 1915 in which an imaginary fleet was the German high seas fleet; expecting just a possibility of having eventually to come in contact with the German fleet. We had maneuvers off the coast here, and in the winter of 1915 and 1916 the fleet was sent south as usual in order to keep up its drills and target practice, etc., and in every way be as nearly ready for war as it could be kept. Of course cruising in southern waters as it was, exercising constantly, naturally there were certain conditions that would be produced in the vessels that before sending them even out for an engagement, unless it was necessary to do so very quickly, it would be advisable, if not necessary, that they should go to a yard and be put in trim before being sent far away, and in that way to that extent every vessel was not ready. And also as I recall it now there may have been vessels—and I think there were vessels—that were in reserve, both on this coast and on the west coast, that were not in as good condition as they should have been. They were not ready. There were a great many reasons for that. The situation in this country in doing everything we could to help the Allies with that they needed made such a demand on the labor market, etc., that it was hardly advisable to break in on that unless it became absolutely nec-

essary, I should say. In other words, the policy that we pursued was adding to the cause quite as well one way as the other.

The CHAIRMAN. Then you would not say that all of the lighter forces, such as scouts and cruisers, that we had at the time of the outbreak of the war and that were not being used to protect our neutrality were ready and available for use with the fleet?

Admiral BENSON. I do not think all of them were, no, sir. I do not think so. Just which ones I could not say.

The CHAIRMAN. You were a graduate of the War College, Admiral?

Admiral BENSON. Not what you would call a graduate, no. I took the summer course at the War College, and I have been there on various occasions, and have kept pretty closely in touch with the War College; but I am not what you would call a graduate of the War College, I suppose, because the War College has developed considerably since—

The CHAIRMAN. How long a course did you have at the War College?

Admiral BENSON. I think in 1906 I was there for two or three months; just how long I have really forgotten. I have been back to the War College. I have delivered a lecture there on certain strategic features in the Pacific. I have kept in touch more or less with the War College work, and while I have not been an actual student at the War College, I believe that I have kept about as well informed of the practical questions connected with the War College and its work as most officers, and I have been in the fleet and actually commanded a battleship in the fleet, and all, where the problems and principles of the War College were actually being developed. I do not pose as a theoretical War College officer. I am simply a plain sailor and practical naval officer.

The CHAIRMAN. You say that you have kept up with the War College and with what the War College was doing. You do not mean that anybody can get the same experience outside of the War College that they could while attending it, of course?

Admiral BENSON. No; I do not; and I think you can not always get the experience at the War College that you get outside.

The CHAIRMAN. It is very different work, is it not; entirely?

Admiral BENSON. Absolutely; and I would like to say I consider it a very necessary and a very important work, and one that can not be too strongly emphasized, Mr. Chairman.

The CHAIRMAN. But you took no course there since 1906?

Admiral BENSON. No; I have not been there, regularly attached there, since 1906.

The CHAIRMAN. Do you think that our battleship forces, with a few destroyers and no scouts and no screening vessels, no submarines or aeroplanes or battle cruisers, could have successfully met the German fleet in mid-Atlantic soon after we had declared war, if the German fleet had been in the same condition that it was at the time it met the English fleet in the battle of Jutland?

Admiral BENSON. Without any destroyers or cruisers or airplanes?

The CHAIRMAN. No. I did not say without any destroyers, but with the few that they had at that time.

Admiral BENSON. Whether I think they could have successfully done it?

The CHAIRMAN. Yes.

Admiral BENSON. That is so thoroughly hypothetical that I would even hate to express an opinion on a thing of that kind.

The CHAIRMAN. Why do you think it is so hypothetical?

Admiral BENSON. Most naval battles have been surprises. I do not know that the discrepancy would have been so very much greater than what actually did take place; but I do not like to mention names. I do not know that the discrepancy would have been so very much greater than what actually did occur.

The CHAIRMAN. What do you mean, what actually did occur? Do you mean at the battle of Jutland?

Admiral BENSON. Yes; what took place.

The CHAIRMAN. At the battle of Jutland?

Admiral BENSON. Yes; in middle Atlantic, that distance from their base. I doubt whether that discrepancy would have been very much greater. At any rate, as commander in chief of our fleet, I should not have hesitated to have made the attempt.

The CHAIRMAN. You would not have hesitated?

Admiral BENSON. No, sir.

The CHAIRMAN. Do you believe that a fleet made up as ours was at that time, and with the destroyers that we had at that time, could have met the German fleet, with their battleships and destroyers and battle cruisers and other vessels that they had at that time, with a chance of winning?

Admiral BENSON. I am sure, as commander in chief of the fleet that I should not have hesitated to make the attempt.

The CHAIRMAN. Of course, any commander of a fleet in a critical case would do whatever was necessary—would do his duty, and if necessary go down with his ship. What I am asking you is whether at that time our fleet was in condition to meet the German fleet as it was at that time?

Admiral BENSON. Theoretically, no; Mr. Chairman, it could not be, because I understand you to mean that the German battle fleet had all of its battle cruisers and light cruisers and all of its destroyers.

The CHAIRMAN. Practically four times as many destroyers as we had?

Admiral BENSON. Yes.

The CHAIRMAN. So that you would not——

Admiral BENSON. Theoretically, it is impossible.

The CHAIRMAN. Several of the witnesses have already testified that our fleet could have met the German fleet and probably could have whipped it. You would not say that that was so?

Admiral BENSON. Theoretically it is an impossibility. It is a purely theoretical question, and the theoretical answer is that it would have been an impossibility.

The CHAIRMAN. According to the laws of war it would have been an impossibility?

Admiral BENSON. The whole thing is theoretical, and my answer will have to be the same. Theoretically it would have been impossible.

The CHAIRMAN. And an admiral or commander of a fleet who would have informed the department that his fleet in that condition could have met the German fleet on a footing of equality would be at least lacking in his duty, would he not?

Admiral BENSON. I should consider that it was. I should consider that it was, with the situation as you stated. I would have no hesitancy in saying so.

The CHAIRMAN. Do you think that the War College or the General Board would justify the policy of leaving our battleships with no scouts or screening vessels in the event of a war?

Admiral BENSON. Do I think they would be?

The CHAIRMAN. Do you think they would justify such a policy?

Admiral BENSON. I do not. They could not. They never have.

The CHAIRMAN. Now, why did we not have any scouts? What was the reason for that?

Admiral BENSON. Well, that is a pretty difficult question to answer, Mr. Chairman. As you know, so far as I have been in the service, which is 48 years now, we have studied the question of preparing the Navy for war, and from time to time the things that were necessary for this preparation have been submitted and they never have been fully complied with. The reason, in my opinion, is this, that the technical officers in the service, who are educated by the Government for a special purpose and for no other particular purpose, have never been permitted to exercise fully the responsibilities, as I see them, that should be placed upon them. They study these questions; they prepare what they believe is necessary for proper preparation of the Nation's Navy for war, and those recommendations have never been fully carried out.

The CHAIRMAN. Well, Admiral, I think you misunderstand my question, or I may not have put it clearly. I meant, why did we not have the scouting vessels which we had available for service with the fleet? Who was responsible for our not having them with the fleet?

Admiral BENSON. Those that were in active commission were scattered in different parts of the world for the ordinary cruising purposes where the vessels are ordinarily kept, and, as I said just now, it was felt that they were in a position to look out for the interests of the United States in these various places where they were located.

Then, as I can recall it—I do not want to make a statement that is not exactly correct—the view I had at that time was, in regard to raiders, in case we did get into the war that these ships were scattered around the world where they would be in position to act in reference to the enemy raiders. That, to the best of my recollection, is one of the views that I had, and which affected the policy that was pursued at the time.

The CHAIRMAN. Were you responsible for the policy yourself?

Admiral BENSON. Of where they were?

The CHAIRMAN. Yes; of not having them with the fleet.

Admiral BENSON. Yes.

The CHAIRMAN. You yourself were?

Admiral BENSON. Yes; I assume that responsibility.

The CHAIRMAN. And if the fleet and the Navy were not in all respects ready for war and for battle, were you responsible or was the Secretary responsible?

Admiral BENSON. No; I was not responsible for it.

The CHAIRMAN. You were not?

Admiral BENSON. And I do not think that the Secretary was responsible for it.

The CHAIRMAN. You do not think that the Secretary was responsible?

Admiral BENSON. No, sir.

The CHAIRMAN. Who was?

Admiral BENSON. I do not think we had the ships to have it properly prepared.

The CHAIRMAN. But if those ships that we had were not ready, then who is responsible?

Admiral BENSON. I think the situation was, largely, as I said a little while ago, these vessels were cruising around in places where, in my judgment, they were well placed.

The CHAIRMAN. I know, but somebody must have been responsible for taking those forces of the fleet and having them either ready or not ready for war.

Admiral BENSON. They were performing the duty which at the time was considered necessary; and as to the placing of the ships, I was responsible for where they were placed.

Not only that, but I was not responsible for their coming north when they did. I opposed that when the fleet came north.

The CHAIRMAN. Who was responsible for that?

Admiral BENSON. I think the Secretary decided on that, on account of the recommendation of the General Board. That is my recollection of it. I would have kept the fleet in southern waters.

The CHAIRMAN. There must have been some responsibility for all the ships that were not ready in all respects for war, and now I want to find out where that responsibility lies, whether with you as Chief of Operations, or whether it lies with the Secretary.

Admiral BENSON. But, Mr. Chairman—

The CHAIRMAN. That is a hypothetical question, if you like. Say, if they were not, who would be responsible?

Admiral BENSON. Well, it would be very largely, if not altogether, you might say, the Chief of Naval Operations. It ought to be, if it was not.

The CHAIRMAN. Yes; but is that—

Admiral BENSON. It ought to be his responsibility.

The CHAIRMAN. Yes; but that is a different matter. Would you say that he was responsible?

Admiral BENSON. It is hard for me to say, Mr. Chairman, if he had recommended to the Secretary a different line of action, whether he would have approved it or not, because I felt that at the time that with the exception of bringing the fleet north, those ships were fairly well distributed for the actual conditions. You see, from the questions you are asking, it is a little difficult. As I said in the beginning, I stated my broad principle that as a naval officer I would have had the fleet mobilized and I would have had many more vessels and would have had everything ready for anything we were called upon to do, if I had known that it was the intention of the people to go to war; but under the general conditions that existed, of our strict neutrality and the necessity for maintaining that attitude, which had been made so evident by the people of the country, I felt then, and I still feel, that the fleet as it was distributed, under the circumstances and taking these things into consideration, was about as well as we could do. I do not know whether I made myself plain or not. It is a little difficult to do.

The CHAIRMAN. That is not what I want to know. I want to know whether they were not—and you have already testified that they were not—in all ways ready for war. Now, if they were not in all ways ready for war, the vessels that we actually had in our

possession, on whom was the responsibility for their not being so ready?

Admiral BENSON. I think the conditions were very largely responsible for it.

The CHAIRMAN. That is, you do not think you were responsible, and you do not think that the Secretary was?

Admiral BENSON. That is, I think that the Chief of Naval Operations would be responsible for not recommending to the Secretary, and insisting, that everything be ready.

The CHAIRMAN. Then, if they were not ready, the Chief of Naval Operations was responsible. We have had a great deal of testimony as to whether they were or were not ready. Now, I want to see where the responsibility lies in case they were not ready.

Admiral BENSON. It is very difficult to say.

The CHAIRMAN. It could not be on anybody but the Chief of Naval Operations or the Secretary, could it?

Admiral BENSON. Yes; it could be on both, to a certain extent.

The CHAIRMAN. Who has the final say?

Admiral BENSON. The Secretary of the Navy has the final say.

The CHAIRMAN. In every case?

Admiral BENSON. But he is very largely influenced by the Chief of Naval Operations.

The CHAIRMAN. Precisely; but he has the responsibility on his shoulders?

Admiral BENSON. Yes.

The CHAIRMAN. I think, under the law, the Chief of Naval Operations does not have the responsibility?

Admiral BENSON. No; except for certain things; the preparation of plans and things of that kind. But he unquestionably should be responsible for it.

The CHAIRMAN. So that you would say that in all cases if the fleet was not in all respects ready for war, that is the available fleet—the responsibility, the ultimate responsibility, lay with the Secretary of the Navy?

Admiral BENSON. No; I would not say that, either.

The CHAIRMAN. I want to you say something, one way or the other.

Admiral BENSON. I think it was a shared responsibility, very largely.

The CHAIRMAN. A shared responsibility?

Admiral BENSON. Yes; I mean the Chief of Naval Operations, for instance, may influence the Secretary. I might have, if I had urged the Secretary of the Navy—

The CHAIRMAN. In view of the question, it is not involved in this case. All the evidence we have had is to the effect—

Admiral BENSON. I say this: If I had urged the Secretary more strongly to mobilize the fleet and to bring these ships in and get them all ready, it is possible that he might have done it; so you see it may have been that I did not urge him strongly enough. But I did not think, under the circumstances, that it was necessary to go further than we did, taking into consideration all the conditions of neutrality, and all conditions; because I took this view of it—I will put it this way—that while I had my strong professional views—strictly professional—as to what was the best thing to do, I also appreciated, as

I felt it, the general attitude of the country and of the Administration, and that it was the proper thing to try to meet that situation as far as possible.

The CHAIRMAN. That is all very well, Admiral, but you were responsible or you were not responsible. In the law which created the office of the Chief of Naval Operations, at first the proposition was made, and I think recommended by the General Board, that the word "responsible" be put in, in which case the Chief of Naval Operations would have been responsible for the preparedness of the fleet; but the word "responsible" was cut out of the law before it was passed, as I recall the matter.

Admiral BENSON. I can not recall that particular fact. I do not know anything about it.

The CHAIRMAN. The responsibility was therefore taken away from the Chief of Naval Operations. We have had a good deal of testimony about the matter, and I think that I am correct in that statement.

Admiral BENSON. Putting it on the ground, Mr. Chairman, of a strict interpretation of the law, of course the Secretary is ultimately responsible for anything; but I do not want to be put in the position of trying to shake any of my responsibility as Chief of Operations and putting it on the Secretary of the Navy.

The CHAIRMAN. I understand. You do not recall about the word "responsible" being put in the act?

Admiral BENSON. I do not, sir. I paid very little attention to the question of legislation. I had as much as I could do to attend to the daily duties I had.

The CHAIRMAN. Do you know whether, under the law, you were or were not responsible?

Admiral BENSON. I consider I was responsible for certain of the plans; but even that part, I was responsible under the Secretary of the Navy. I felt that I was responsible under the Secretary of the Navy.

The CHAIRMAN. Of course in following out your duties you would consult the act under which you were appointed?

Admiral BENSON. Yes, I did.

The CHAIRMAN. And you felt that under certain circumstances you were responsible, and under certain circumstances not?

Admiral BENSON. Yes.

The CHAIRMAN. That was your construction of the act?

Admiral BENSON. Yes; but in any case I was responsible under the Secretary of the Navy.

The CHAIRMAN. In all cases?

Admiral BENSON. In all cases.

The CHAIRMAN. You were responsible to make recommendations to the Secretary?

Admiral BENSON. Yes.

The CHAIRMAN. In all cases?

Admiral BENSON. Yes.

The CHAIRMAN. And if your recommendations were not followed then the Secretary assumed responsibility?

Admiral BENSON. He became responsible; yes, sir.

The CHAIRMAN. In that matter of having the vessels we had fully in a state of preparedness, did you make any such recommendations to the Secretary?

Admiral BENSON. I could not answer that question.

The CHAIRMAN. In considering the relative weight of the metal in the broadsides of two opposing fleets, with scouts and screening vessels and so forth, if one of these fleets has these adjuncts and the other has not, are the chances even?

Admiral BENSON. They are not even.

The CHAIRMAN. You are familiar with the details of the battle of Jutland?

Admiral BENSON. In a very general way; yes, sir.

The CHAIRMAN. Do you not think that the result of the battle emphasizes the necessity of scouts, submarines and planes and all means of quickly getting the signaling information to the commander in chief?

Admiral BENSON. It does.

The CHAIRMAN. Very clearly?

Admiral BENSON. Yes.

The CHAIRMAN. The battle of Jutland was fought in 1916?

Admiral BENSON. I think it was, yes.

The CHAIRMAN. Do you recall the date?

Admiral BENSON. The 18th of May, I think it was; somewhere along in May.

The CHAIRMAN. May, 1916?

Admiral BENSON. Yes.

The CHAIRMAN. Nearly a year before we went into the war?

Admiral BENSON. Some time; yes, sir. We went into the war in April, 1917.

The CHAIRMAN. Nearly a year, I say.

Admiral BENSON. Yes.

The CHAIRMAN. In the year following the battle, and before we entered the war, could we not have supplied our fleet with some of these important auxiliaries?

Admiral BENSON. I think we could. We might have gotten more destroyers. By taking extraordinary steps we could have, possibly. Hardly, though, within a year. That would have been pretty difficult.

The CHAIRMAN. At least we could have gotten all our available vessels ready for such service, could we not?

Admiral BENSON. Yes.

The CHAIRMAN. Do you know whether the Secretary of the Navy or the Navy Department made any determined efforts to equip our fleet with those auxiliaries between 1915 and 1917?

Admiral BENSON. I think an effort was made. I have forgotten what word you used to qualify it.

The CHAIRMAN. I said any determined effort.

Admiral BENSON. A determined effort. Only in a normal way; not in an unusual way.

The CHAIRMAN. No special stress was laid on the importance?

Admiral BENSON. I do not think any special stress was laid on it.

The CHAIRMAN. Even after the battle of Jutland?

Admiral BENSON. I do not think so.

The CHAIRMAN. Well, why not? You were familiar with the details of that battle?

Admiral BENSON. If you remember, Mr. Chairman, the bill that was passed in 1916, our building program which was adopted, I think

possibly would be an answer to that. Possibly I was mistaken in saying that no special effort was made, because I think that that building program that was adopted in 1916 shows that an effort was made to begin to prepare the fleet more strongly.

The CHAIRMAN. You mean the 3-year program?

Admiral BENSON. Yes.

The CHAIRMAN. It was not assumed that that would be ready for any immediate use?

Admiral BENSON. No; of course not.

The CHAIRMAN. And no special attempt was made——

Admiral BENSON. But I think that that bill was gotten through probably in, you might say, the normal way of carrying appropriations through.

The CHAIRMAN. Was work commenced on the construction of ships under that program at all?

Admiral BENSON. My impression is that it was begun as quickly as the plans and everything could be put in shape for it. That is my recollection now.

The CHAIRMAN. As a matter of fact, the construction has not yet been completed, has it?

Admiral BENSON. No; but a great deal of it was started, Mr. Chairman, and stopped after we actually got into the war and had to use all of the facilities for building destroyers and that type of vessel.

The CHAIRMAN. Yes; and very properly.

Admiral BENSON. Yes.

The CHAIRMAN. But everything was not done to speed up their program, and in fact it was not done?

Admiral BENSON. No; but I think that an effort was made, whether it was particularly urgent or not. I do not recall that it was particularly urgent, but an effort was made to get the thing going as quickly as possible.

The CHAIRMAN. But no special effort was made to provide ships under that plan?

Admiral BENSON. No; I do not think any special effort was made, as I recall it.

The CHAIRMAN. Was it not plain to you in 1915 and 1916, and especially after the battle of Jutland, that the people of Germany relied largely upon the submarine campaign to win the war by starving England and France?

Admiral BENSON. Yes, sir; I think it was.

The CHAIRMAN. Then why, if there was any danger of our getting into the war, did we not prepare to build antisubmarine craft?

Admiral BENSON. Well, as I say, the only answer I can give to that is the building program of 1916.

The CHAIRMAN. Yes; but that was not a special building program for antisubmarine craft in case we should get into war with Germany, was it?

Admiral BENSON. Well, it was considered at that time that those were the proper steps to be taken. At least, I can not recall—I understand that what you want me to state is whether we tried to do something in excess of what that bill indicated. I can not recall.

The CHAIRMAN. Whether you tried to do something particular in reference to antisubmarine craft?

Admiral BENSON. I say that the only answer to that situation is that building program of 1916.

The CHAIRMAN. And that was clearly not for immediate emergencies?

Admiral BENSON. No; but no one could tell at that time how soon we would be drawn into it. That, in itself, was going a good way toward the preparation. I think there was a general feeling at that time, possibly throughout the country, that we would not be drawn into the war, as I recall the general condition of the country at that time.

The CHAIRMAN. After the spring of 1916?

Admiral BENSON. I think so. The election took place in the fall of 1916, and the voice of the people seemed to indicate that they did not want war and did not expect it.

The CHAIRMAN. The gratitude for keeping us out of war?

Admiral BENSON. Yes.

The CHAIRMAN. Was it not evident that England's fleet, together with our own battleship forces, would hold the main German fleet, and that we could best contribute by putting down the submarine menace?

Admiral BENSON. I beg your pardon; will you repeat that?

The CHAIRMAN. I say was it not evident that England's fleet, together with our own battleship forces, could successfully hold the main German fleet—

Admiral BENSON. Yes.

The CHAIRMAN. And that we could best contribute our part in the war by helping to down the submarine menace?

Admiral BENSON. Yes; as far as that particular phase of it.

The CHAIRMAN. Were you a member of the Joint Army and Navy Board?

Admiral BENSON. Yes.

The CHAIRMAN. Did the board meet frequently and consider general action, offensive and defensive, in the months immediately preceding the declaration of war?

Admiral BENSON. We did meet, but as I recall it, very few of our meetings referred to matters immediately connected with the preparation for—it is almost impossible for me to recall just what we did treat of. I remember finally getting permission to have the General Army and Navy Board reconvene; but it is really impossible for me now to recollect just what subjects we took up or what particular line of policy we pursued. It would be impossible for me to tell you at this time, sir, just what we did; but I remember that I succeeded in getting permission to have the board reconvene.

The CHAIRMAN. How do you mean, permission to have the board reconvene?

Admiral BENSON. Well, an order had been given to stop the meetings of the board for a while on account—

The CHAIRMAN. When was that?

Admiral BENSON. That was before I became Chief of Naval Operations. There were certain things that I do not know now just led up to it, but I know that it had not met for a long time, and after I became Chief of Naval Operations there were certain questions that we had to discuss. For instance, take the question of defensive areas for mining of harbors and channels on our coast. That is one

thing we took up; the question of just who would control the mine fields; and certain things in regard to the laying down of the mine and the character, and where one service would let go and the other take up, were considered.

The CHAIRMAN. That was the part that had to do with the cooperation between the Army and Navy?

Admiral BENSON. That was the Joint Army and Navy Board?

The CHAIRMAN. A very important board, was it not?

Admiral BENSON. Yes.

The CHAIRMAN. How were the meetings of that board called?

Admiral BENSON. We were usually called by the civil member of the board, and the subjects were drawn up and different papers were assigned to the different members of the board—a sort of subcommittee arrangement.

The CHAIRMAN. At the time you became Chief of Naval Operations who was chief officer of that board?

Admiral BENSON. Admiral Dewey.

The CHAIRMAN. Admiral Dewey?

Admiral BENSON. Yes.

The CHAIRMAN. And you say that special permission was given after you came in—

Admiral BENSON. Yes; to revive the meetings.

The CHAIRMAN. Was that at your instigation?

Admiral BENSON. As I recall, it was.

The CHAIRMAN. Did you hold meetings thereafter frequently?

Admiral BENSON. We did, more or less so; but I think the meetings were called after a sufficient length of time had elapsed to allow the different subjects to be discussed by the different subcommittees. When they reported that they were ready to submit reports, meetings were called.

The CHAIRMAN. Do you recall any action taken pursuant to the recommendation of that board?

Admiral BENSON. No; I do not.

The CHAIRMAN. Would it not have been possible for this joint board, in conjunction with the General Board and the Office of Operations, to have inaugurated plans for complete and proper coordination of the Army and Navy for naval warfare, and ready for immediate effect, if this board had studied and considered thoroughly this important question?

Admiral BENSON. It would.

The CHAIRMAN. But it was not done?

Admiral BENSON. No, sir. I say, a complete plan. No; I think the answer is correct; a complete plan gotten up. The joint action was not gotten up.

The CHAIRMAN. After you became Chief of Operations, on the whole were the meetings of this board encouraged or discouraged by the Secretary?

Admiral BENSON. I think after they were once revived it was left entirely to the board as to how often they would meet and the subjects they would take up.

The CHAIRMAN. There was no discouragement?

Admiral BENSON. No, sir.

The CHAIRMAN. Simply nothing ever was done?

Admiral BENSON. I do not think there was ever any discouragement.

The CHAIRMAN. Were you ever asked as a board to take up any important matters by the Secretary?

Admiral BENSON. I do not think so.

The CHAIRMAN. As a general thing, in warfare do you advocate the offensive or the defensive?

Admiral BENSON. The offensive, decidedly.

The CHAIRMAN. Do you not think that it was important for us to assume a quick, determined offensive against Germany in this war?

Admiral BENSON. I think after we found out what was the best way to do it we should have; yes, sir.

The CHAIRMAN. Do you think we were in any great danger of attack from Germany on this side after the Battle of Jutland?

Admiral BENSON. Not until war was declared.

The CHAIRMAN. After war was declared?

Admiral BENSON. After war was declared I felt very strongly we were in danger of attack by submarines—the only way he could attack us.

The CHAIRMAN. By many submarines?

Admiral BENSON. Well, possibly a half a dozen. I did not think they would send a very strong force over, but I thought they would unquestionably send some; and even a half a dozen, not knowing where they would strike on the long length of our coast, was, in my opinion, a very severe menace.

The CHAIRMAN. Could we not have been informed of the start of the German submarines?

Admiral BENSON. Up to a certain extent, we could. The information we got, as a rule, was very good.

The CHAIRMAN. And you expected that they would attack us over here?

Admiral BENSON. I did. I felt that the *U-53* that came into Newport the summer before, was a pathfinder, and unquestionably one of the first things that would happen——

The CHAIRMAN. And you felt at the outbreak of the war that the first thing for us to do was to protect ourselves against this attack by German submarines?

Admiral BENSON. Yes.

The CHAIRMAN. And at any time during the war they could have done the same thing?

Admiral BENSON. They did, later on; but of course they could have done it at any time.

The CHAIRMAN. And did you change your opinion as to the best thing that we could do, about concentrating our forces here to meet them, or sending our forces abroad?

Admiral BENSON. I felt we should be always prepared on this side. I felt that my duty as Chief of Naval Operations was to safeguard our own coasts and our own interests, which I tried to do.

The CHAIRMAN. That first we should keep our coasts and interests safe; and, second, help out on the other side?

Admiral BENSON. I felt it would be this way—that we should be first able to protect our own coasts and interests, and then do everything we could to help them on the other side.

The CHAIRMAN. After July 1, 1917, do you think we were very adequately prepared on this side to protect ourselves against German submarines?

Admiral BENSON. I thought we were fairly well prepared to do so.

The CHAIRMAN. Even after sending ships abroad?

Admiral BENSON. Yes. By that time we had gotten a lot of yachts and other vessels in condition, and our nets were extended so that I thought we were fairly well protected against them. We also were in a position to protect against them in all our harbors.

The CHAIRMAN. You think that yachts and small vessels of that kind are an adequate protection against submarines?

Admiral BENSON. I do not think they are adequate. I think, under the circumstances, with the number that we had, we could have safeguarded our harbors.

The CHAIRMAN. Did we not, as a matter of fact, change our policy about protecting this coast and send over all of the forces, later on in the summer of 1917, that we possibly could?

Admiral BENSON. When we were prepared to meet the situation that might arise. Of course, as the situation became more serious and we had the battleship fleet in the Chesapeake Bay and the York River, and our nets were in better position to protect them, I did decide that it was worth while to take a little more chances than we had been taking, and took them. For instance, I ordered the fleet to go to sea without protection, because I felt that it was so important that the fleet should be kept ready and in fighting trim, that I assumed that responsibility myself.

The CHAIRMAN. Where were the nets used?

Admiral BENSON. The nets were used down in Chesapeake Bay—at the entrance to Chesapeake Bay.

The CHAIRMAN. As protection for the fleet?

Admiral BENSON. For the protection of the fleet. They were used across the mouth of the York River, at Newport, at Boston, and they were used in the Delaware and at New York, and in nearly all of our ports.

The CHAIRMAN. Were they used to such extent that no submarine could have gotten by them in any such plan?

Admiral BENSON. I do not think so. I do not think you can stop submarines with nets. But I think it was the best protection we had, and our nets were patrolled, and I think that between the patrol and the net it would have been difficult for them to get through.

The CHAIRMAN. We had no airplane protection during the summer of 1917?

Admiral BENSON. We did not have to have protection.

The CHAIRMAN. After our destroyers had been sent largely over to the other side, practically the only protection we had against them was what we could get from these nets, and——

Admiral BENSON. We always kept some destroyers over here.

The CHAIRMAN. And a few yachts?

Admiral BENSON. Yes; and we depended on them. And, as I say, we always kept some destroyers, and we had the small craft to assist them, and the nets.

The CHAIRMAN. And when the submarines finally came over in 1918 they did not do a great deal of damage on this coast, did they?

Admiral BENSON. They did not; and I will say that when the final charts were given of the mines that they had laid on this coast there was only one bunch, I think, that we had failed to locate very promptly.

The CHAIRMAN. We had no very large force at work against them?

Admiral BENSON. We had a great many small vessels.

The CHAIRMAN. Small vessels?

Admiral BENSON. Yes. For instance, as soon as they appeared off the coast I sent 20 of the 110-foot destroyers right down there. They came out of New London and around Montauk Point with listening devices, and after that they rarely got inside of the 100-fathom curve—I mean the German submarines. I think the coast was pretty well guarded at that time against submarines.

The CHAIRMAN. Do you think the coast was pretty well guarded during the first three or four months of the war?

Admiral BENSON. I think fairly well. Not as well guarded as I would have liked to have had it, but it was fairly well guarded. There is a point there, Mr. Chairman, that possibly, in justice to what has been said, I ought to bring out. About the 10th or 11th of April—I think it was about that date, but before that, before we entered the war—we were informed that the British would send a vice admiral and that the French would send a rear admiral to this country, who were then cruising in the West Indies, to consult with our board as to what we should do to help them out. They came here, and I, with the commander in chief of the Atlantic Fleet, met them at Hampton Roads, and we had a conference there on the 10th or 11th of April. That was a few days after we entered the war. And then they came to Washington and we had another conference here with the Secretary and Assistant Secretary and members of the General Board. They outlined in pretty definite terms what they would like us to do.

Vice Admiral Browning had not been very long from the North Sea, commanding a squadron in the North Sea.

The French admiral, I do not know how long he had been overhere.

They had very definite ideas as to what they would like us to do, which they outlined, and we immediately agreed to that.

For instance, as you know, there were raiders adrift at that time, and they particularly wanted us to relieve the British vessels on our east coast. We agreed to take a line, I think it was 50 degrees of west longitude, from the extreme northern limit to join just north of the Windward Islands, taking in the Virgin Islands, and then coming to the westward across the Caribbean, to the boundary between Panama and Colombia, and we were to be responsible for that area, completely, and we were to hold cruisers in readiness to pursue and attack any raider that might appear in the North Atlantic or in the Gulf.

At the same time we agreed to take an area that, as I recall the limits, ran along the fifth degree of south latitude to some distance off the Brazilian coast, then paralleling the coast down off the mouth of the Rio de la Plata. We sent a force down there for that purpose.

In addition, the British asked us to send two destroyers to the other side, principally for the moral effect, as showing the flag of the United States with the Allies.

The CHAIRMAN. That was about what date?

Admiral BENSON. That was, I think, on the 11th of April, five days after we had declared war.

The CHAIRMAN. And on substantially the same date you received a telegram from Admiral Sims showing the opinion on the other side, did you not?

Admiral BENSON. He sent one about that time—the 13th, I think.

The CHAIRMAN. Direct from the British?

Admiral BENSON. From the British headquarters; yes.

The CHAIRMAN. So that it was evident that the people on the other side did not take the view taken by Admiral Browning at this meeting, which was that we should keep up a defensive on this side principally?

Admiral BENSON. I did not get that view.

The CHAIRMAN. You said we were told to send a couple of destroyers over for the moral effect?

Admiral BENSON. Yes; but we only got this message from Sims. I did not assume that that was the combined intelligence of the British Admiralty, by any means, sir.

The CHAIRMAN. It was the general result of the findings of our representative over there, who was right in touch with the British admiral.

Admiral BENSON. He had only been there a few days, I think; not over 48 hours, sir.

The CHAIRMAN (continuing). Saying that it was a very acute opinion over there?

Admiral BENSON. I did not so accept it, and I still do not, sir. I differ with you in regard to that.

The CHAIRMAN. Well, we will come to that later on. I will have some further questions about that. But you do think that in warfare it is important to assume the offensive rather than the defensive?

Admiral BENSON. Absolutely.

The CHAIRMAN. And defending an area over on our own east coast and down as far as the Caribbean would be really a form of defensive warfare, would it not?

Admiral BENSON. That would.

The CHAIRMAN. Assuming that there were no German vessels there at the time?

Admiral BENSON. That was defensive warfare.

The CHAIRMAN. And you were in favor of an offensive?

Admiral BENSON. I was in favor of the offensive as a principle.

The CHAIRMAN. Then do you not think it would have been strategic to assume the offensive rather than the other kind?

Admiral BENSON. Not under those conditions; no, sir. I think we did exactly what was the right thing to do at the time, with what we had. As a principle in warfare, I believe in active offensive warfare. This was not altogether our war. The Allies had been in it for some years, and they had, or should have had, very definite policies and plans upon which they were conducting war, and we were going in there to join with them, and I do not think we made any mistake at the time. I think we did exactly the right thing under the circumstances.

The CHAIRMAN. Then you would say we were justified in assuming the defensive?

Admiral BENSON. As we did.

The CHAIRMAN. Practically, instead of the offensive?

Admiral BENSON. Under all the circumstances, the defensive measures we took I think were quite necessary and quite proper.

The CHAIRMAN. And that we should pay the principal attention to the defensive outlined by Admiral Browning and the French admiral?

Admiral BENSON. No, sir; exactly, I do not think that.

The CHAIRMAN. I asked your——

Admiral BENSON. I say, we should have complied with their request as we did, except that they asked us for two destroyers to be sent to the other side, and we sent six instead of two.

The CHAIRMAN. Yes; but you also got their instructions from them besides that, or suggestions——

Admiral BENSON. No; we did not get instructions from them.

The CHAIRMAN. No; you could not get instructions, but you did get suggestions. And that is what Admiral Sims was over there to get, to find out and send you.

Admiral BENSON. He was sent over there to get information for our consideration, and such action as we thought best to take.

The CHAIRMAN. Yes; and the information that he got was fairly authoritative, was it not?

Admiral BENSON. I assumed that it was.

The CHAIRMAN. And he was sent over for the purpose of getting authoritative information?

Admiral BENSON. Of getting information; exactly.

The CHAIRMAN. Then your reasons for assuming the attitude that we did were that we had to patrol this coast, had to hold this coast as against possible attacks by submarines, and had to comply with British requests for patrolling everything west of 50; is that right?

Admiral BENSON. Yes; that we should comply with their requests, which we did.

The CHAIRMAN. Do you think that Germany would have been so short-sighted as to send more than a very few submarines over here at the beginning of the war, 3,500 miles from her coast?

Admiral BENSON. As I say, she might have sent half a dozen, and I think it would have been a wise thing for her to do.

The CHAIRMAN. Was it not her policy to make the best expenditure of her ammunition by keeping her submarines as near home as possible?

Admiral BENSON. I think she would have gotten much better results, or under ordinary circumstances she would, if she had sent half a dozen over to operate on our coast. Of course when she did send them, it had very little effect, because it did not slow up the movement of our troops or any others of our vessels.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Wednesday, May 5, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

WEDNESDAY, MAY 5, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235 Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

TESTIMONY OF ADMIRAL W. S. BENSON—Resumed.

The CHAIRMAN. The committee will come to order. Admiral Benson, what was the date when the first German submarine came to our coast after the commencement of the war?

Admiral BENSON. I think it was the 21st or the 25th of May.

The CHAIRMAN. That is the date when it was first sighted on this side?

Admiral BENSON. Yes, when it first appeared off the mouth of the Delaware.

The CHAIRMAN. Were we not warned; did we not receive a considerable warning before it came?

Admiral BENSON. We got a message from Admiral Sims that one would appear off the coast in that vicinity about that time.

The CHAIRMAN. And how long before it appeared did you get the message from Admiral Sims?

Admiral BENSON. I could not say as to that.

The CHAIRMAN. Several weeks?

Admiral BENSON. It was several weeks; possibly three weeks.

The CHAIRMAN. Would we have been justified in keeping a large number of our Navy in home waters for fear of having submarines or a few raiders, when the situation was as critical on the other side as it was at the beginning of the war?

Admiral BENSON. Only a sufficient number to safeguard the situation.

The CHAIRMAN. And you have already stated, have you not, that our first duty was to protect our own coast?

Admiral BENSON. I say to safeguard the situation on this side. I except the fleet from that, of course—the main fleet. I think the main fleet should have been kept here, whether it was necessary to safeguard the coast or not.

The CHAIRMAN. You do think that the main fleet should have been kept here?

Admiral BENSON. I do.

The CHAIRMAN. In its entirety?

Admiral BENSON. Yes; practically in its entirety.

The CHAIRMAN. Could not the second-line battleships, with nets, mines, and a few patrol vessels properly distributed have protected us from grave danger from sudden attack?

Admiral BENSON. The object in keeping the fleet on this side was not primarily to protect the coast from a fleet attack. It was primarily to hold a proper reserve, which was not needed elsewhere, in case it should become necessary later on.

The CHAIRMAN. For instance, do you mean in case a German raider should break through the English fleet?

Admiral BENSON. In case the German should have defeated or driven off the sea the British fleet.

The CHAIRMAN. Was there much prospect of that?

Admiral BENSON. There was not much, but there was some—sufficient to warrant the action taken.

The CHAIRMAN. Even if they could have helped greatly on the other side you felt in view of this possibility of the German fleet coming over that we were justified in keeping our main battle fleet over here?

Admiral BENSON. It would depend on the extent to which they were needed on the other side. The situation was such that it was not felt that they were needed, but that the older battleships might have been of service in attacking some of the enemy's ports in the North Sea and the British Channel. We would have readily acceded to something of that kind.

The CHAIRMAN. The older battleships?

Admiral BENSON. The older battleships.

The CHAIRMAN. But not the dreadnaughts?

Admiral BENSON. But not the dreadnaughts.

The CHAIRMAN. And you felt they were in a better position based over here than based over on the other side, if, for instance, they were needed to go?

Admiral BENSON. Absolutely better. There was absolutely every reason that they should remain on this side. The logistics of the situations made it almost absolutely necessary that they should remain on this side.

The CHAIRMAN. And if the British fleet was to have another engagement with the German fleet you felt that it was of more value to have our fleet in these waters in case the British fleet was beaten by the German fleet than it would have been to have had them over there to participate in the action on the other side?

Admiral BENSON. Taking the situation as it was, I think it would have been better.

The CHAIRMAN. Why?

Admiral BENSON. Well, because in any problem of that kind you have got to weigh all of the various elements and the conditions and draw your conclusions as to what would be the best solution of the problem and act accordingly. As I said just now, the logistics of the situation made it absolutely ill-advised to send any of our battleships to the other side unless they were absolutely necessary.

The CHAIRMAN. The committee, Admiral, is not made up of technical naval experts, and I do not think we understand exactly what you mean by the logistics of the situation.

Admiral BENSON. Why, supplying them with fuel and with provisions and keeping them in proper condition of repair, and in addition to that it would have been necessary to safeguard them with destroyers and craft of that kind; to put them where they would have been properly looked out for.

The CHAIRMAN. Do you not think that the moral effect on Germany would have been very great if we had sent our fleet over at the very beginning of the war?

Admiral BENSON. I do not; no, sir.

The CHAIRMAN. Do you think that the moral effect on the Germans of sending our troops over was very great?

Admiral BENSON. Yes.

The CHAIRMAN. Then why would not the moral effect have been great of sending the fleet over?

Admiral BENSON. It was an entirely different question. The relative force and conditions of the problems were entirely different.

The CHAIRMAN. Would it not have indicated to Germany that we were going very extensively into the war?

Admiral BENSON. I do not think Germany needed any greater proof than she had.

The CHAIRMAN. Not of having our troops go over?

Admiral BENSON. I mean of our troops going over, and what we were doing from day to day.

The CHAIRMAN. Very few of our troops were going in the first few months of the war.

Admiral BENSON. Simply because it was difficult to get them over; and they were not ready to go. But they knew they were coming; and then we were lending money to the Allies and we were giving them money and all the assistance that it was possible to give them under the circumstances. I do not think there was any question.

The CHAIRMAN. At the time it was difficult to get them over?

Admiral BENSON. I mean the shortage of vessels to carry them; but the principal reason was because the troops were not ready to go. When they were ready they were taken over practically as fast as they were ready.

The CHAIRMAN. There have been some discrepancies in the testimony of witnesses about that.

Admiral BENSON. There is not any question in my mind, Mr. Chairman, in regard to that.

The CHAIRMAN. Then you know all about the military situation in the summer of 1917?

Admiral BENSON. Not all about it, no; but I know a good deal.

The CHAIRMAN. Do you know just what troops were ready and what troops were not ready?

Admiral BENSON. No, but I know that as fast as we were called upon to take new troops over we took them over.

The CHAIRMAN. As fast as you were called upon to take them over?

Admiral BENSON. Yes, sir.

The CHAIRMAN. Called on by the War Department?

Admiral BENSON. Yes, by the War Department.

The CHAIRMAN. Was there any consultation with the Bureau of Operations or with the Navy Department, so far as you know, about this question of taking the troops over?

Admiral BENSON. There was quite a long—it took some time to settle the question as to whether the Navy would take them, and whether they would transport them themselves, and it was some little time, and it developed in settling that question. I had several conferences, I think, with Gen. Bliss, who was then Chief of Staff, and it was finally settled between Gen. Bliss and myself, as I recall it. I think Capt. Pratt in his testimony went over that subject pretty thoroughly, if I remember rightly.

The CHAIRMAN. And do you say that in all cases the Navy was ready as soon as the troops were ready?

Admiral BENSON. That is my recollection, that the troops were never kept waiting by the Navy.

The CHAIRMAN. That is, by the Navy as far as guarding ships were concerned.

Admiral BENSON. As far as taking them over when they were ready to go; they were taken over as fast as they were ready, to the capacity of every ship we had.

The CHAIRMAN. Was there not some delay about the Navy taking over the handling of the transports?

Admiral BENSON. There was some delay, caused by the discussion that went on between the two departments as to just who would handle the ships and who would not. Just how long that was I can not say. There was some delay. I do not think it was unusual, and I do not think that that delay materially interfered with the carrying of the troops over.

The CHAIRMAN. But you personally had no definite knowledge about when the troops were ready or were not? You were advised about their going over?

Admiral BENSON. Not definitely; no. Only in a general way, that as fast as the situation developed it was handled.

The CHAIRMAN. Considering the blockade of the main German fleet, was not the situation very favorable to an offensive campaign by us against the German submarine at its submarine base?

Admiral BENSON. I think that the bases should have been attacked, and I so urged while the war was in progress; and one of my conferences with the British Admiralty in London in 1917 was to urge more active operations against the bases of the submarines. But it was an operation that had to be not only a concerted action, but the principal part of it would have been necessary to have been taken by the Allies, we simply to add our part to it; and all during the summer I urged active operations of that kind and could never understand why we did not get definite plans, etc., from the other side as to how some such operation could be carried out. While in London I agreed with Admiral Jellicoe on a plan, a very confidential plan, that was to be carried out later on, in which I not only volunteered to place our ships but insisted that our ships should be placed there.

I found, for instance, when I went to the fleet in November, 1917, that there seemed to be some doubt in Admiral Beatty's mind particularly as to whether he could call on our ships that were over there. There was not apparently an understanding that he could call on our destroyers at Queenstown and any other vessels we had over there to assist him in case of a general engagement, if it became necessary. I was very much surprised to find that condition, and stated

to him that not only if he did not call for them we would be disappointed, but it would be, in my opinion, an unpardonable offense against the American Navy. But that was the condition that I actually found, that they were uncertain whether or not they could actually use them.

The CHAIRMAN. Why was there such uncertainty?

Admiral BENSON. I do not know. We had our representative there. I supposed that the relations were such that those questions had been settled; but they had not been settled.

The CHAIRMAN. You mean that they should have been able to call on our ships without our consent?

Admiral BENSON. He said he did not know, and he was a little anxious to have positive assurance that he could call on them.

The CHAIRMAN. Was there ever any question of his calling on our ships without our consent? Did he have the direct right to call on our ships to take part?

Admiral BENSON. Only through our representative in London, sir; until those that joined later on. When the battleship division joined, then, of course, they were placed under his orders.

The CHAIRMAN. When they joined they were actually under his orders?

Admiral BENSON. Yes; they were actually under his orders.

The CHAIRMAN. But until that time——

Admiral BENSON. If he had wanted to have the use of the destroyers at Queenstown he would have had to simply call on Admiral Sims through the Admiralty, to get them.

The CHAIRMAN. But he would have to call on Admiral Sims?

Admiral BENSON. Yes, sir.

The CHAIRMAN. Did he tell you that he had called on Admiral Sims?

Admiral BENSON. No, sir; he did not. He said that he did not exactly know what the situation was, whether he could do it or should do it.

The CHAIRMAN. That is, the point had not been explained?

Admiral BENSON. It had not been determined over there, as to just what the situation should be.

The CHAIRMAN. This is in the case of that particular plan you referred to?

Admiral BENSON. No, sir; I am not speaking of a particular plan.

The CHAIRMAN. You spoke of a very secret plan that you had for attacking the submarine bases.

Admiral BENSON. No, sir; this was not that plan. I only mentioned that——

The CHAIRMAN. Did you find any friction between our forces over there and the British forces?

Admiral BENSON. None at all.

The CHAIRMAN. Between our forces and the British forces as to cooperation?

Admiral BENSON. None at all.

The CHAIRMAN. Did you find that there was any fault being found with Admiral Sims as to the way that he was handling the American forces?

Admiral BENSON. None at all; on the contrary.

The CHAIRMAN. But you say——

Admiral BENSON. I say that I found that condition to exist.

The CHAIRMAN. That was when?

Admiral BENSON. In November, 1917.

The CHAIRMAN. That they were not able to tell just to what extent they could call on our forces?

Admiral BENSON. That he did not know to what extent he could call on our forces for the destroyers, etc., that were over there.

The CHAIRMAN. Was that because there had been no occasion to call on our forces for any such comprehensive plan?

Admiral BENSON. Whether that was the occasion or not, I can not say. As I remember the situation, there had been no particular occasion that required it, but the question came up in a general conference with Admiral Beatty, when I was with him with the Grand Fleet.

The CHAIRMAN. Would you say that it should have been thoroughly understood beforehand?

Admiral BENSON. I think it should have been.

The CHAIRMAN. Let me finish my question. Would you say that it should have been thoroughly understood beforehand that our forces would go in and cooperate on any plan that was put up, regardless of whether we approved the plan or not?

Admiral BENSON. Well, not at all, sir.

The CHAIRMAN. Then I can not see what——

Admiral BENSON. I do not wish to say anything of the kind. On the contrary, we instructed Admiral Sims that in case of any specific plans in which our forces were to be used, we must know what the plan was and have an opportunity to judge of it before our forces were put in it.

The CHAIRMAN. Precisely.

Admiral BENSON. Yes.

The CHAIRMAN. Then your instructions were really the cause of their not knowing just to what extent they could count on our forces.

Admiral BENSON. No, they were not.

The CHAIRMAN. Why not?

Admiral BENSON. Because this was not the question of a specific plan, but——

The CHAIRMAN. But you said there was a specific plan.

Admiral BENSON. No, I can not agree with you.

The CHAIRMAN. You referred to it in connection with Admiral Jellicoe; you said that you had with him a specific plan.

Admiral BENSON. I was speaking of the use of the vessels.

The CHAIRMAN. That is what brought the question up?

Admiral BENSON. That is what brought it up here.

The CHAIRMAN. That is what brought the question up over there?

Admiral BENSON. No, it was not what brought the question up over there.

The CHAIRMAN. What was it that brought it up?

Admiral BENSON. The general conference I had with Admiral Beatty. In discussing the general situation over there he brought up this question as to whether—I forget, now, whether I brought it up myself—if he felt satisfied with the condition generally, or whether he brought it up; but the question was discussed between us, and that situation developed.

The CHAIRMAN. And Admiral Beatty made a complaint to you? Admiral BENSON. Not a complaint, no; not a complaint, I do not—

The CHAIRMAN. Well, what was it about it?

Admiral BENSON. That he was uncertain in his mind as to whether he would be justified in calling on Sims for the use of the destroyers in the case of the German fleet coming out and an engagement being imminent, and he wanted their additional assistance.

The CHAIRMAN. In any event he would have had to have asked Admiral Sims, and Admiral Sims would have had to ask the department, would he not?

Admiral BENSON. No, I do not think Admiral Sims would have had to ask the department, under the situation, if that had been the case, where an engagement was imminent. Our forces were sent over there to take such part as they could, in cases where they were necessary.

The CHAIRMAN. Have you any doubt that Admiral Sims would have given him that assistance?

Admiral BENSON. I have not the slightest bit of doubt.

The CHAIRMAN. Then the fault that you find with Admiral Sims in the matter is that he had not specifically agreed that in the last crucial moment our forces would go right in with them regardless of any instructions at all?

Admiral BENSON. No, sir—

Senator PITTMAN. I object to that question.

The CHAIRMAN. I am putting that in the nature of a question.

Senator PITTMAN. And he is going to answer it directly, all right, but I am going to protest here against charging the Admiral with finding fault with Admiral Sims when there is absolutely no statement of that kind on his part.

The CHAIRMAN. Well, it is a criticism, is it not, Admiral?

Admiral BENSON. It was simply an explanation of the situation as I found it over there.

The CHAIRMAN. If there was a fault on the part of Admiral Sims in the matter, the committee would like to have explained what fault there was.

Admiral BENSON. I can not say whether it was Admiral Sims's fault or Admiral Beatty's. I am rather inclined to think that the British should have initiated the movement.

The CHAIRMAN. I will ask the stenographer to read my question, now.

(The question referred to was read by the stenographer as follows:)

The CHAIRMAN. Then the fault you find with Admiral Sims in the matter is that he had not specifically agreed that in the last crucial moment our forces would go right in with them regardless of any instructions at all?

The CHAIRMAN. Now will you answer that, Admiral?

Admiral BENSON. I have answered, to say that I have found no fault with Admiral Sims. I was simply explaining to the committee, or attempting to, the condition that I found, and as I stated, the fault was, I think, that there should have been an understanding in regard to that matter; but whether it should have been initiated by Admiral Sims or by the British Admiral, my own opinion is that it should have been initiated by the British.

The CHAIRMAN. Regardless of whether you are finding fault with Admiral Sims or not, will you answer that question?

Admiral BENSON. I thought I did answer it.

The CHAIRMAN. I asked you whether it specifically referred to the action that our Navy abroad would take in a very critical moment. In ordinary matters I take it that there was proper cooperation, was there not?

Admiral BENSON. Yes.

The CHAIRMAN. And they knew what they could count on from us.

Admiral BENSON. That is my complaint, that there was quite a cooperation——

The CHAIRMAN. But there was only a question in Admiral Beatty's mind as to what action the Navy would take in a case such as that to which you have referred?

Admiral BENSON. Yes. That is the point, as I understand it; if I catch your question.

The CHAIRMAN. Now, what was the reason for the British having this feeling of doubt about what we would do?

Admiral BENSON. I do not know of any reason.

The CHAIRMAN. Did they make any complaint to you about the lack of cooperation that we had shown, or about the small number of ships we had sent over?

Admiral BENSON. They did not. On the contrary, the information I got was the opposite. They thought that we had done very well indeed to send as many as we had sent, and they were delighted with the cooperation. Of course they wanted as many as they could get, but they thought that we had responded very generously.

The CHAIRMAN. What was the reason that they should have any question about what we would do in case of an engagement such as that to which you refer?

Admiral BENSON. Why, no; but it was a very natural thing that in going over the whole situation, the Admiral should have said, very naturally, "Well, now suppose"—as I said just now, I do not know just what brought it up, but suppose we were discussing destroyers and the shortage of destroyers; he might have said, "Now, in case the Germans should come out and we needed a great many more destroyers to go with the fleet, I am a little uncertain as to whether or not I should or could call on Sims for the destroyers at Queens-town." I think that is no complaint; it is a very natural question that should have come up, as many other questions came up during the conference we had, so as to have a full and clear understanding of the whole situation, and the forces engaged.

The CHAIRMAN. But you found no cases on the other side where there was fault finding with Admiral Sims and with the way in which he was conducting our forces over there, as far as cooperation was concerned?

Admiral BENSON. I found none in Great Britain; no.

The CHAIRMAN. You say that you found a feeling on the other side that we had sent over everything that was possible to send over.

Admiral BENSON. That was the impression I got.

The CHAIRMAN. I do not recall your exact words. That was the impression you got?

Admiral BENSON. Yes.

The CHAIRMAN. Who gave you that impression?

Admiral BENSON. I could not say. That would be impossible, Mr. Chairman, at this time. I talked with the various lords of the British Admiralty, with the first sea lord; I talked with a great many of their principal officers. We held a conference with the whole British cabinet in which Mr. Lloyd-George addressed the commission, of which at the time I happened to be the ranking member, and to whose address I had to respond, and the impression made on my mind—I can not quote the words, but that was the impression made on my mind, they felt that we had been very generous in the help we had sent.

The CHAIRMAN. It was a general impression made on your mind?

Admiral BENSON. Yes, sir.

The CHAIRMAN. You can not substantiate it by quoting any particular authority on this side.

Admiral BENSON. No; I can not.

The CHAIRMAN. What was the date that you went over?

Admiral BENSON. I reached there on the 7th of November; I reached the British port.

The CHAIRMAN. Prior to that time had Admiral Sims, at the request of the British Admiralty, or acting in conjunction with the British Admiralty, asked for some battleships to be sent over?

Admiral BENSON. Yes.

The CHAIRMAN. When was that?

Admiral BENSON. I can not give the date, as to when this request was made. It was made sometime before that. It was quite a good while before that. I have an idea that it was in July, but that is merely a guess.

The CHAIRMAN. It was first suggested, I believe, in his cable of the 11th, was it not?

Admiral BENSON. About the battleships? I do not think so, but I could not be certain.

The CHAIRMAN. I think the telegram of April 11 referred to certain battleships to be based on Brest.

Admiral BENSON. Yes; possibly so.

The CHAIRMAN. After you had reached the other side you found that it was advisable to send those ships over?

Admiral BENSON. Yes; I thought it was.

The CHAIRMAN. And you ordered the ships to be sent over?

Admiral BENSON. I then cabled home for them.

The CHAIRMAN. In view of the fact that you state that the authorities on the other side were well satisfied with the number of ships that we had sent over, and the kinds of ships that we had sent over, why did you give that order?

Admiral BENSON. Mr. Chairman, it is pretty hard to answer a question of that kind. I must say that I am trying my very best to give you honest answers to the questions you are putting to me, and I insist that the answers I have given have been such; and this thing of the battleships I do not think is one that differs from the reply that I have made.

The CHAIRMAN. Well, they wanted the ships over there?

Admiral BENSON. And I thought it would be advisable; and that, I do not think invalidates in any way the statement I have made, sir.

The CHAIRMAN. Well, they wanted the ships; Admiral Sims had recommended the ships; the ships had not been sent over; and yet

you state that they were satisfied and very much pleased with what we had done.

Admiral BENSON. I stated that they thought we had been very generous in the contribution that we had made.

The CHAIRMAN. Not as to battleships?

Admiral BENSON. I do think they were satisfied. I will go further and say, if I have not used the word, that they were satisfied; but they wanted some of them, and I do not think there is any inconsistency in the language I am using. I do not wish to make that distinction.

The CHAIRMAN. Do you think that they were satisfied with the battleships that we had not sent over?

Admiral BENSON. It is hard for me—

Senator PITTMAN. We would like to know when the date was when they asked for the battleships?

Admiral BENSON. April 14.

The CHAIRMAN. As I recall the testimony, it was first alluded to on April 11, and first requested in July.

Admiral BENSON. Yes; April 14.

The CHAIRMAN. April 14?

Admiral BENSON. On the 14th. [Reading:]

At present our battleships can serve no useful purpose in this area except that two divisions of dreadnaughts might be based on Brest for morale effect, against anticipated raids by heavy enemy ships in the Channel out of reach of the British main fleet.

That, I think, was the first suggestion about the matter at all, and it was not definitely recommended until July; July 21. [Reading:]

(Cablegram sent July 21, 1917. Serial No. 120.)

To Secretary of the Navy (Operations).

No. 120. Visited Grand Fleet 19th with Admiral Jellicoe for consultation with commander in chief. The result is that Admiralty requests that the four strongest coal-burning battleships with six destroyers be sent join Grand Fleet now Firth of Forth. Also that our submarines could be very usefully employed in antisubmarine campaign.

The reasons for this request is that five *King Edward* class must be placed out of commission and their place taken by four dreadnaughts to provide officers and gunnery and torpedo ratings for light cruisers, destroyers, submarines, etc., to be commissioned. Shortage of officers will be 400 after advancing reserve officers from motor boats, etc., to fleet. Our oil-burning battleships could not be supplied, and more than four would unduly increase burden on coal supply, and would necessitate additional screening vessels not now available.

The conference agreed that moral effect would be very great; also mutual benefit of exchange of ideas and methods. The intelligence service thereby created between the two fleets would be superior to any service which exists or could be established. Carefully selected expert staff should be sent. Also recommend temporary detail representative our commander in chief on Admiral Beatty's staff.

Sms.

The CHAIRMAN. Then you would not say that they were entirely satisfied with what we had done about the battleships?

Admiral BENSON. To that extent. In addition to what we had sent they wanted the battleships. There can be no question about that, sir.

The CHAIRMAN. Did we have an adequate air service in 1917?

Admiral BENSON. No; we did not.

The CHAIRMAN. Had not Admiral Fiske and the General Board advocated a division of aeronautics in 1913?

Admiral BENSON. Admiral Fiske had had a good deal to say about it. I forget whether or not he had advocated a division or not; I could not say.

The CHAIRMAN. Was such a division ever established?

Admiral BENSON. Hardly a division. Well, under our organization it was a division. There was an officer in charge of it who had direct charge, and for that purpose sums were allotted; especially appropriated and allotted.

The CHAIRMAN. When was it first established?

Admiral BENSON. That I can not say, because I found it there when I came to Washington.

The CHAIRMAN. Was it later abolished?

Admiral BENSON. The division?

The CHAIRMAN. Yes.

Admiral BENSON. I do not think the division has ever been abolished. It was taken in hand——

The CHAIRMAN. You do not recall that it was established at one time and later abolished?

Admiral BENSON. I found it in existence when I went there.

The CHAIRMAN. In existence?

Admiral BENSON. Yes.

The CHAIRMAN. You do not know whether it had been abolished and then recreated?

Admiral BENSON. No, sir; I do not know.

The CHAIRMAN. Was it in operation after you came into the department?

Admiral BENSON. Yes; it was in operation, but in not a very large sense or a very efficient way. It was a very difficult situation to handle.

The CHAIRMAN. It had not been doing any effective work up to the time you came into the department?

Admiral BENSON. No; I would not say that it had not been. I think they had been making progress slowly, and we had, for instance, established a station then at Pensacola and there was an officer in charge of it, Capt. Bristol. I think he was in charge of it when I came to Washington and I think he was very energetic and tried to push the situation, and an effort was made generally to carry on the development that had already begun before I took charge of the office.

The CHAIRMAN. Do you know if that division had been in constant operation from the date when it was first started in the department up to the time you came in?

Admiral BENSON. No; I do not.

The CHAIRMAN. You had no knowledge whatever about that?

Admiral BENSON. Very little; not enough to answer your question satisfactorily; no.

The CHAIRMAN. Do you know whether they had prepared plans and data up to the time that you came in that were of value?

Admiral BENSON. I do not recall anything except the general estimates for the appropriations for building certain numbers, and I think the idea of the catapult had also been suggested, and the establishing, as I say, of a station at Pensacola; and the *North Carolina*, I think, was assigned to this particular purpose after I took charge of the office. But with the many problems that came up just

at that time it is really a little difficult for me to state just what was in existence and what was not, because I naturally attempted to connect everything up as soon as I could, and it was impossible for me to state just where that began or what I found in connection with this particular branch. The detailed history, if you want it, could be supplied, I take it, from the Office of Operations.

The CHAIRMAN. Will you refresh your memory on that matter, so that to-morrow morning you can give me some further information about it?

Admiral BENSON. If you will be good enough to tell me just what you want it to cover, Mr. Chairman.

The CHAIRMAN. I want to know the history of that division of aeronautics that was recommended by Admiral Fiske in 1913.

Admiral BENSON. Admiral McKean informs me that it is already in the record, and whatever is in the department I can get, if you wish me to do it.

The CHAIRMAN. Can you tell me on what pages of this record it is dealt with it?

Admiral McKEAN. I can get it for you. It is books 43 and 44 of the typewritten evidence. I think the history of aeronautics is in 44. I will have it up to-morrow morning, the whole business. A memorandum shows the history of that office from the day it was established.

The CHAIRMAN. Perhaps Admiral McKean can answer my question.

Admiral McKEAN. I can.

The CHAIRMAN. It was recommended by Admiral Fiske in 1913, was it not, to the General Board?

Admiral McKEAN. I do not know how complete the recommendation Admiral Fiske made was and what organization he recommended.

The CHAIRMAN. Admiral Fiske and the joint board, I mean.

Admiral McKEAN. I do not recall that they recommended an organization, but there was an organization with a director of aeronautics, Capt. Briscoe, and that functioned until early in March, 1916, when the director of aeronautics was sent to sea on the *North Carolina*, and aeronautics for the time being was put under my charge in material, by Admiral Benson. There was not any director during that time. The office was absorbed into material, temporarily. As soon as we got another officer trained, and as soon as we got a new organization shaped up, Capt. Irwin became again director of aeronautics, and the office was divided from material and given a separate existence.

The CHAIRMAN. But was it not in continuous operation from the time it started until 1916?

Admiral McKEAN. It was not under a director, no. It was operated in that way from March until about July, I think, when it was divorced from material again.

The CHAIRMAN. When was that?

Admiral McKEAN. March, 1916.

The CHAIRMAN. I am talking about before 1916. I asked you if it was not in continuous operation from the time of its creation up to that time?

Admiral McKEAN. Oh, yes; up to the spring of 1916 it was in continuous operation.

The CHAIRMAN. That was the information I wanted.

Admiral BENSON. Then you do not wish me to get anything, Mr. Chairman?

The CHAIRMAN. No; it is not necessary. Admiral Benson, you do not, however, know what stage of perfection it had reached prior to your coming in, at the date when you came into the office of the Chief of Operations?

Admiral BENSON. Not in detail. We had a certain number of machines, and flying was going on at Pensacola, and they were training flyers down there, and as I say, the *North Carolina* was assigned; but that was afterwards. I think she was assigned after I took the office. We tried to develop the catapult, that is to have it arranged so that the flyers could get away from the ships. I think I witnessed the first attempt, at Pensacola, myself.

The CHAIRMAN. In 1915 Capt. Bristol's estimates were cut from \$13,000,000 to \$2,000,000, were they not?

Admiral BENSON. I think it was from \$13,000,000 to \$2,000,000.

Admiral McKEAN. \$13,500,000.

The CHAIRMAN. From \$13,000,000 to \$2,000,000?

Admiral BENSON. Yes.

The CHAIRMAN. That was while you were Chief of Operations?

Admiral BENSON. Yes.

The CHAIRMAN. Who was it that cut these estimates, you or the Secretary?

Admiral BENSON. It was done at my recommendation.

The CHAIRMAN. At your recommendation?

Admiral BENSON. At my recommendation, yes.

The CHAIRMAN. What was the occasion for your recommending such a cut?

Admiral BENSON. Because I felt that with the facilities we had to work with, and the number of people that we had, that we could devote intelligently to that kind of work, we could not properly expend more than \$2,000,000 of the public funds; and because I felt that to increase the appropriations to that extent would be ill-advised—I mean, to the extent of thirteen and a half millions.

The CHAIRMAN. \$13,000,000, I thought it was, was it not?

Admiral BENSON. Or \$13,000,000; whichever it was. As a matter of fact, the General Board recommended \$5,000,000, and I think we got \$3,500,000.

The CHAIRMAN. Congress raised it to \$3,500,000?

Admiral BENSON. That is my recollection.

The CHAIRMAN. Did the Secretary pare down your estimate to \$2,000,000?

Admiral BENSON. That is my recollection, that he made the estimate of \$2,000,000.

The CHAIRMAN. That was in the fall of 1915?

Admiral BENSON. Yes; 1915, as I recall it.

The CHAIRMAN. At that time was it not evident that aeroplanes were bearing and would bear a considerable part in the war?

Admiral BENSON. Not as evident as it became later.

The CHAIRMAN. But still, evident, was it not?

Admiral BENSON. Yes; there was evidence that they might bear a decided part in it; but I do not think it was conclusive.

The CHAIRMAN. If that whole \$13,000,000 had been appropriated and if Capt. Bristol had been authorized to hasten preparations, would we not have had a larger air force in 1917?

Admiral BENSON. I doubt it. I think that the principal part as I recall, of that appropriation, was to go for two aircraft vessels. I did not think that we had reached the stage where we needed those vessels or where it was necessary to build new ships for that purpose; and as I recall it now, the major part of that appropriation was to build and equip two aircraft ships.

The CHAIRMAN. What were those two aircraft ships; what sort of ships were they?

Admiral BENSON. They were two large ships that would carry aircraft with appliances on board from which they could depart and to which they could return, with storage of aircraft on board.

The CHAIRMAN. And \$11,000,000 of the appropriation was to be used for that purpose?

Admiral BENSON. I said the major part of it.

The CHAIRMAN. I am asking you a question.

Admiral BENSON. I said the major part. Just how much, I could not say, now.

The CHAIRMAN. Were there any other plans made by Capt. Bristol except for those two aircraft ships?

Admiral BENSON. No. I think he had other plans, but as I recall it, the major part of it was to build these two ships. What the other part of it was for I could not possibly recall now.

The CHAIRMAN. Were there not other plans made by Capt. Bristol that could not be carried out on account of the failure to give him the appropriation then asked?

Admiral BENSON. That I could not say. I am informed by Admiral McKean that the full recommendations of Capt. Bristol as made at that time are in the record already.

The CHAIRMAN. But you are not familiar with those recommendations?

Admiral BENSON. No; I am not familiar with them.

The CHAIRMAN. Will you cite the page, if you find it out, on which those full recommendations are given?

Admiral MCKEAN. I can not give the page, but it is under the head of my testimony on aviation, and I submitted the originals, or a copy of the originals.

The CHAIRMAN. In any event, Admiral, do you not feel that if we had made specific preparations in regard to aircraft and extensive appropriations at that time, it would have been useful in 1917, after we had entered the war?

Admiral BENSON. Well, in the light of subsequent events it would unquestionably have been well to have devoted more time and more money to that particular phase of the question; but in view of the situation as it was then—and that is what we had to go upon—in my judgment, who had charge of this whole business and all, I felt that that was the best thing to do in the light of what we then had; that that was the best thing to do, and I did it. I would do it again under the same circumstances. As time went on we got the money, and we developed it, and I think that our service made a very creditable showing, and was of material assistance in a way, as far as it could be used on the other side.

The CHAIRMAN. Did we have any aeroplanes over there in the first six months of war?

Admiral BENSON. I do not think we did.

The CHAIRMAN. If we had had some ready and could have sent them over, would they not have been of assistance?

Admiral BENSON. Well, I do not think it was possible to get them. We were making every effort to develop motors, and it was not really until the Liberty motor was developed that it was practically possible to produce aircraft in large quantities. And besides, it was a question, and it is only within a very recent time that it has not been, whether aircraft for naval purposes would ever have been very useful except for the purpose of obtaining information, as guards, and in fleet operations, and so on.

The CHAIRMAN. Would they not have been of use in protecting our coasts over here, and thereby relieving vessels that might have been sent over there?

Admiral BENSON. Exactly; they were useful, and they were very efficiently used on our coast, for obtaining information.

The CHAIRMAN. Would they not have been useful in dropping bombs on submarines?

Admiral BENSON. As I say, that was later. I do not think the bomb proposition had been developed in 1915.

The CHAIRMAN. I am talking about 1917, if we had had them?

Admiral BENSON. Well, 1917.

The CHAIRMAN. If we had had the planes, would they not have been of use on our own coast, and thereby have released vessels that could have gone over to the other side?

Admiral BENSON. They might have; yes.

The CHAIRMAN. Then would you not say that it would have been a good thing if we had developed our air service in 1915, so as to have been better prepared?

Admiral BENSON. It would have been a good thing.

The CHAIRMAN. If we had had an air service with plenty of aircraft and plenty of personnel?

Admiral BENSON. It would have been an excellent thing.

The CHAIRMAN. Yet under the circumstances you say you would do the same thing again?

Admiral BENSON. Yes; without the light of subsequent events, I mean with the same plan and under the same circumstances. I am willing to admit that I made a mistake, if you like; but that is what I say.

The CHAIRMAN. You mean that you would make a mistake again?

Admiral BENSON. Yes; if I did not have the experience I have now I would probably make the same mistake, if you call it one.

The CHAIRMAN. But you are willing to admit that in view of what has happened since, it would have been a great deal better if we had had them?

Admiral BENSON. Yes; I am willing to admit that.

The CHAIRMAN. Admiral Mayo, I think, has testified that a certain number of the personnel of his battle fleet were withdrawn from the fleet to act as armed guards on merchant ships?

Admiral BENSON. Yes.

The CHAIRMAN. A certain number of officers and men.

Admiral BENSON. Yes.

The CHAIRMAN. That was both in the spring and in the summer of 1917?

Admiral BENSON. Yes.

The CHAIRMAN. After these men were withdrawn, would you say that our battleship force was ready for battle?

Admiral BENSON. Not as ready as it should be; no. It was short of personnel; short at times of personnel completely, and at almost all times of experienced, well trained personnel.

The CHAIRMAN. And that was the existing state of affairs on April 6, 1917, was it not?

Admiral BENSON. Yes; we were short of personnel. We were decidedly short of personnel.

The CHAIRMAN. That is for the battle fleet?

Admiral BENSON. The battle fleet was short of officers and men for battle purposes.

The CHAIRMAN. Was the organization of the Office of Operations fully prepared for before our entrance into the World War?

Admiral BENSON. I would like to know exactly what you mean. I want to know what is coming after, so that I can answer the question.

The CHAIRMAN. I would like you to comment on the organization of the Office of Operations at the time that we went into the war.

Admiral BENSON. The Office of Operations, so far as the organization was concerned—I mean by that the different divisions, etc.—was more or less in skeleton form. We were short of necessary personnel, and we had to build up; for instance, as I stated yesterday, increase our communication service, our force for coding and decoding, and generally for the fully efficient working of the office we were decidedly short on personnel, if I understand that phase of the question you want me to discuss. If you want me to discuss the law, or anything it was acting under, that is a different matter.

The CHAIRMAN. I would like you to discuss the matter in detail, if you will.

Admiral BENSON. That would involve my opinion of how the Office of Operations should—what authority would be given it and what its organization should be.

The CHAIRMAN. I would like to have that.

Admiral BENSON. Well, my opinion is that the office of the Chief of Naval Operations should have the responsibility for the preparation of the Navy as a whole. He should be held strictly responsible for that, but he should have the authority that enables him to discharge that; all, of course, under a civilian Secretary of the Navy.

The CHAIRMAN. But he should have the authority?

Admiral BENSON. He should have the authority to coordinate all of the technical activities of the Navy Department, and he should be held responsible for their efficient coordination and cooperation.

The CHAIRMAN. And, having that authority and that responsibility, he should be free to give his views to Congress, should he not?

Admiral BENSON. He should, in that position, and there should be some arrangement by which he should be kept fully informed as to the policies of the Government—I mean the political policies of the Government; what international problems were pending, what the international policy of the administration is at the time, any changes that might involve the distribution of forces. But he

should be particularly held responsible for the proper and efficient coordination of all the naval activities. But he should have the authority, and it should be so understood. For instance, he should be able to give directions to all the bureau chiefs. In addition to Material and Operations, he should particularly have directly under him the question of personnel. I think he should have a voice in the selection, and be almost responsible for the selection of all officers for prominent positions, both in the Navy Department and in the fleet.

The CHAIRMAN. How do you mean, almost?

Admiral BENSON. Of course I do not want to sidetrack the Secretary. He, as the head of the department, of course, is held responsible to the country for the department. But it should be so well established that he has this right that the Secretary would not go counter to it unless there were most excellent reasons. You might possibly get a Chief of Naval Operations that was not efficient, or he might have prejudices, and he might have all kinds of things, and there should be some check on him, and the Secretary should have that authority, because in the last analysis the Secretary is responsible. But I do think that in order to have the organization what it ought to be that change should be made.

I think I can illustrate my point. If you will remember, the administration came into power on the 4th of March, 1917, and we went to war on the 6th of April. If you had had an entirely new Secretary come in on the 4th of March, with the old organization before the Office of Operations was established, you would practically have had nothing to coordinate the technical activities of the department except a new Secretary of the Navy.

The CHAIRMAN. And is that true of your organization you now have?

Admiral BENSON. It is not true now; but we have not gone far enough, in my opinion. I think we saved the day—I dislike to refer to it, as I happened to hold the position, but I have a firm conviction in my own mind that what saved the day in this whole war, certainly so far as we are concerned, was the establishment of the Office of Operations in the work it did during the war; but I think it ought to go further and go along the lines that I have stated.

The CHAIRMAN. You say that the Chief of Operations should have practically the power of appointing his subordinates in Operations?

Admiral BENSON. For instance, the chief of a bureau—I think he should have a decided say in who should be chiefs of bureaus.

The CHAIRMAN. But always subject to the approval of the Secretary?

Admiral BENSON. Always subject to the approval of the Secretary, yes.

The CHAIRMAN. Of course if the Secretary did not approve he would not appoint the men that were indorsed by the Chief of Operations, and how would you get anywhere in such a case? I take it that at the present time the Chief of Operations advises with the Secretary about appointment, does he not?

Admiral BENSON. Not always. I was not always consulted. But I will say this. My experience in the Navy has been this, that if an officer will conscientiously and firmly and properly present his views, and they are sound, there is not anybody, the Secretary of the

Navy or Congress or anybody else, that has the interest of the country at heart, that is going counter to it; and where it has not been done it has been because, in my opinion, they either did not have the authority or did not properly perform it.

The CHAIRMAN. Then would you go so far as to say that the Chief of Operations should make the appointments and the Secretary should have the right, after they are made, simply to turn them down?

Admiral BENSON. No; that he should have the right to recommend them.

The CHAIRMAN. He has that right now, if he wants to.

Admiral BENSON. Well, but he has not the responsibility and the authority which I have recommended, that go together.

The CHAIRMAN. Under the clause giving him the responsibility, you would give him the right to make plain his case to the Congress?

Admiral BENSON. Yes; and it should be understood that he should have that, and that it should carry the proper weight.

The CHAIRMAN. But in the same way would he give to the Congress the men that he had appointed or had advised for appointment to these various offices?

Admiral BENSON. No; there is an element of the situation, Mr. Chairman, that can readily be understood. It is very difficult to explain. What I mean is that if it was a well-understood fact that the Chief of Naval Operations had the responsibility and the authority which I have outlined, and that it was incumbent upon him to see that the proper people were recommended to the Secretary to hold these various positions, it is my opinion that the Secretary would always listen to it and be guided by it except in very exceptional circumstances; and even if he went counter to the recommendations, which undoubtedly would often happen—it does often happen—influences are brought to bear and therefore they have to deal with questions of that kind, and it is very difficult to overcome; and therefore, with any system we may have, we can hardly make it absolutely cut and dried and hard and fast.

The CHAIRMAN. But unless you do in some way make it hard and fast, the Chief of Operations might make any recommendations he saw fit, and they might all of them be turned down.

Admiral BENSON. That might be.

The CHAIRMAN. I can not see that that would change matters very materially from the condition that they are in at the present time.

Admiral BENSON. I think it would, sir. I think it would make a very decided difference.

The CHAIRMAN. You state that the Chief of Operations should be informed about the foreign policies of the Government?

Admiral BENSON. Yes, sir.

The CHAIRMAN. Why?

Admiral BENSON. In order that he may know whether or not the Navy is properly prepared to carry out those policies.

The CHAIRMAN. Should not the Navy at all times be prepared practically to carry out the policies?

Admiral BENSON. Yes; but it might be necessary to make certain changes. It might be necessary to increase the forces then existing. What they have, it is up to the Chief of Naval Operations to see that

what is already provided is always ready; but a change in foreign policy might make it desirable to increase a certain force, or to move it from one part of the world to another, or something of that kind, to be prepared to carry out the policy.

The CHAIRMAN. It is conceivable, is it not, that the foreign policy of the administration and the foreign policy of Congress might differ?

Admiral BENSON. Of course.

The CHAIRMAN. Which policy should the Chief of Operations be acquainted with?

Admiral BENSON. I think he should be kept informed of the policies of the administration.

The CHAIRMAN. Of the administration?

Admiral BENSON. Yes, sir. He can easily keep track of the policies of the Congress from the discussions that go on; and that is a thing he has to do. But, primarily, he is an official of the administration, and he should be kept informed of its foreign policies, and be kept——

The CHAIRMAN. Before Congress is so informed?

Admiral BENSON. No; I did not say that. But I say he should be kept informed. Just what the details of it should be I have not stated.

The CHAIRMAN. If it is not before Congress is informed, can he not get from the messages of the President to Congress the same information now?

Admiral BENSON. Certain questions might come up from time to time. Congress might not be in session. I do not see that I can express it, Mr. Chairman, in any different language than saying that he should be kept informed.

The CHAIRMAN. I am looking for information, Admiral.

Admiral BENSON. That he should be kept informed of the foreign policies of the administration.

Senator PITTMAN. We would like a lecture on international law.

The CHAIRMAN. We would like your ideas on the matter, concretely put, so that there can not be any mistake about them.

Senator BALL. May I ask a question here?

The CHAIRMAN. Yes.

Senator BALL. He would be a part of the administration?

Admiral BENSON. Yes; but as he is now I understand he is not necessarily kept informed of all the different policies.

The CHAIRMAN. Is the Secretary?

Admiral BENSON. I assume, of course, being a member of the Cabinet, that he is.

The CHAIRMAN. Is not that sufficient, then, if the Secretary of the Navy is kept informed?

Admiral BENSON. If the Secretary always keeps the Chief of Naval Operations fully informed, however he may get it. That is a detail, as to how he should get it, but it should certainly be understood that the Chief of Naval Operations is kept informed.

The CHAIRMAN. If the President has private plans about foreign policies and he does communicate them to the Secretary of the Navy, do you think that he should also be required to communicate them to the Chief of Operations, or through the Secretary to the Chief of Operations?

Admiral BENSON. I think if there is any question at all, sir, that the Chief of Naval Operations is not being kept fully informed, he should have the privilege of being informed by the President of the United States, if necessary, and he should attend Cabinet meetings where policies of that kind are discussed.

The CHAIRMAN. That would be an innovation, would it not, in our form of Government?

Admiral BENSON. I do not know that it would. I am not sufficiently familiar with the details to say. Nevertheless, I think it would be a good thing for the country. I thought that you wanted my views, and that is what I think would be a good idea. It might not be necessary for him to attend those meetings; but, at any rate, some means should be devised by which he is kept fully informed of the foreign policies of the administration that would involve the preparation of the fleet. I think it very important that he should be kept fully informed. He could hardly be held responsible unless he was fully informed.

The CHAIRMAN. You may be right, but he would get a great deal of information that the Senate has not been able to get.

Senator PITTMAN. The Senate has not used the information they got very actively, has it, Admiral?

The CHAIRMAN. Well, we will see about that later.

Would you say that the office of Operations as it was organized at the commencement of the war, in April, 1917, was so adequately prepared for carrying on the war as it should have been or as it could have been?

Admiral BENSON. No; it was not; and I would like to add, if I may, that it did carry it on, and very successfully.

The CHAIRMAN. You mean that the war was won?

Admiral BENSON. Yes; the war was won; and I do not think any serious mistakes were made.

Senator BALL. May I ask him some questions?

The CHAIRMAN. Certainly.

Senator BALL. It would have been carried on just as successfully and at a much less cost, probably, if we had been adequately prepared?

Admiral BENSON. At a very much less cost; yes, Senator; very much.

Senator PITTMAN. May I ask a question there?

The CHAIRMAN. Well——

Senator PITTMAN. Did not your preparation depend primarily upon Congress being willing to appropriate the necessary money——

The CHAIRMAN. Wait a moment.

Senator PITTMAN. Do I understand that the majority of the committee may break the rule, by permission of the chairman, and the minority can not?

The CHAIRMAN. I think it is better to observe the rule.

Senator PITTMAN. I respect it, if that is the ruling of the chair, but——

Senator BALL. I am sorry that I asked the question, but I felt that I was bringing out a point there. Strike it all out, Strike my question out.

The CHAIRMAN. Let it go.

(Informal discussion between members of the committee followed.)

The CHAIRMAN. Then you think that changes might have been made that would have been of advantage?

Admiral BENSON. Yes. We needed more personnel and a larger trained force for that purpose, and it would have helped materially to have had a greater force.

The CHAIRMAN. But you would not say that the office was fully prepared at our own entrance into the war? Other witnesses have testified about that.

Admiral BENSON. Well, it is a little difficult to answer. With what we had, I think we would have made the best of it, if that will answer your question. I think that with what we had we were making the very best of it; but, as I have said, I think the office should have been differently organized, and at least had more authority.

The CHAIRMAN. Did you have a complete planning section?

Admiral BENSON. Not what you would call a complete planning section, no; we did not, Senator.

The CHAIRMAN. The law required you, did it not, to make plans to be in readiness for war?

Admiral BENSON. I was charged with the preparation of plans, yes; and, as I stated yesterday, I felt that plans, as far as it was possible, were either drawn up or in preparation.

The CHAIRMAN. The law provided for 15 assistants in the planning section, did it not?

Admiral BENSON. Not in the planning section. That was altogether in my office.

The CHAIRMAN. Not in the planning section?

Admiral BENSON. Not in the planning section. The law, I am quite sure, does not say anything about a planning section; but that I was charged, as Chief of Naval Operations, with the preparation of plans.

The CHAIRMAN. One of the plans, I think, that was made out by Admiral Fiske, did provide for 15 assistants in the planning section, did it not?

Admiral BENSON. I really do not know, Mr. Chairman, what Admiral Fiske had prepared. As I told you yesterday, I found nothing in the office except an old dirty chart hanging from the wall and one or two other small details. I found nothing of that character that I know of. If it was in the files in the office, I do not recall it. I do not wish to make a statement that might be found inaccurate in that there was some little detail in the office later; but to the best of my recollection that was the condition in which I found the office. Do you wish me to read what there is in regard to the 15 officers? I have it right here.

The CHAIRMAN. Yes; what is that from?

Admiral BENSON. This is from the regulations of the Navy Department, and it quotes the law in regard to the office. [Reading:]

To assist the Chief of Naval Operations in the performance of the duties of his office there shall be assigned for this exclusive duty not less than 15 officers of and above the rank of lieutenant commander of the Navy or major of the Marine Corps.

That was added in the bill of 1916.

The CHAIRMAN. That was in the law?

Admiral BENSON. That was put in the law, in the appropriation bill that passed Congress in 1916.

The CHAIRMAN. And did you have the 15 that the law provided for?

Admiral BENSON. At the time, in 1917?

The CHAIRMAN. At the outbreak of the war?

Admiral BENSON. In 1917 I think I had; but at times I did not have it. There was such a shortage of officers that it was almost impossible to get the number; and that was understood, but I was making every effort to get the officers in and to put them in their places as fast as possible. The office had to be developed from nothing; the various divisions had to be organized.

The CHAIRMAN. What time was that?

Admiral BENSON. August, 1916.

The CHAIRMAN. At any time between August, 1916, and April, 1917, did you comply with the terms of the law?

Admiral BENSON. I did not at all times; no.

The CHAIRMAN. Did you at any time?

Admiral BENSON. Yes; at times, part of the time.

The CHAIRMAN. Part of the time you did have 15?

Admiral BENSON. Part of the time I did have 15.

The CHAIRMAN. When?

Admiral BENSON. I would have to consult the files of the office, Mr. Chairman, to give you that. It is a detail that it would be utterly impossible for me, handling such a tremendous proposition, to remember. You see, I had the whole situation to develop, and I had to leave the details very largely to my subordinates, and it kept me busy thinking out policies and outlining them so that the details could be developed.

The CHAIRMAN. Well, considering that the law required you to have plans, to make plans, in readiness for war, and that the planning department of Operations was one of the most important parts of that bureau, should you not have had a department properly equipped, according to the law?

Admiral BENSON. The law does not require a planning section, but I should have had officers there, and there were some officers there. I do not know just when they came to the office, but it was quite well understood by those who were immediately interested in the office, in Congress, that it was a development.

The CHAIRMAN. What you read was not a quotation from the law? It was a regulation of the department?

Admiral BENSON. No; that was a quotation from the law. That 15 officers is a law of Congress.

The CHAIRMAN. It is law?

Admiral BENSON. It is a law of Congress passed in the act of 1916; August 29, 1916.

The CHAIRMAN (after examining law). These 15 officers referred to need not necessarily be in the planning section?

Admiral BENSON. No, sir; that depended entirely on the Chief of Naval Operations, as to where he would detail them and to what duty.

The CHAIRMAN. Is there any regulation in the department about the planning section?

Admiral BENSON. Well, a planning section was developed, and a well-organized one, before I left the office.

The CHAIRMAN. That is at a later period, during the war?

Admiral BENSON. That is later. The regular planning section, as I recall it, was not normally as such, as a definite division of the office; was not established until after my return from Europe last summer.

The CHAIRMAN. Did you not have a planning section before that?

Admiral BENSON. A so-called planning section, but not recognized as a division of the office; no; I did not.

The CHAIRMAN. Then, the Bureau of Operations, which was responsible for making plans for readiness for war—how did you make your plans?

Admiral BENSON. We had two or three officers who were detailed. I think Capt. Pratt had charge of that for a while; in fact, all the time, practically. Those officers, with the aid of the General Board, which was practically, in a way, under the office—you might say an adjunct to it—got out such plans as were gotten out. Such plans as were gotten out were gotten out by these officers and by the General Board.

The CHAIRMAN. However excellent may have been the services of Capt. Pratt, you would not say that that was a sufficient planning section?

Admiral BENSON. I would not; but I say under the situation, with the shortage of officers and the situation we were facing, it was the best we could do, and that we got out sufficient plans or memoranda, or whatever you wish to call it, to meet the situation.

The CHAIRMAN. But the planning section is really one of the most vital and important sections of the bureau, especially in time of war, is it not?

Admiral BENSON. It is very important; yes. Of course you must have plans to operate with, or policies.

The CHAIRMAN. And you would not say that two or three officers working on plans would really be sufficient, would you?

Admiral BENSON. I do say that they met the situation, Mr. Chairman, as we found it. In a well-completed organization, under different conditions, I would insist; and as soon as it was possible to organize a planning section we did organize it, and it did function.

The CHAIRMAN. But you did not have at the outbreak of the war a planning section at all?

Admiral BENSON. I do not think that at the outbreak of the war we had any organized planning section.

The CHAIRMAN. Did you, as Chief of Operations, have the necessary authority in all respects over the bureaus and other agencies of the Navy Department to enable you to make all plans and preparations for war?

Admiral BENSON. No, I did not say that I had; but I want to say that I had complete cooperation with the bureaus.

The CHAIRMAN. That is a complete personal cooperation?

Admiral BENSON. Personal cooperation; but I did not have the authority over them.

The CHAIRMAN. Did you at any time direct all the bureaus to make preparations for, or to anticipate, war in accordance with any well-considered plan, previous to February, 1917?

Admiral BENSON. The order was sent to all the bureaus, signed, I think, by the Secretary, and I think it was drawn up in my office, and it went out on the 20th of May, 1915, to report the conditions

of their bureaus and offices in relation to the particular subject of readiness for war, and to report any deficiencies that might exist, and from time to time thereafter at regular stated periods to inform the office as to the progress they were making in supplying the deficiencies. That was the 28th of May, I think, 1915.

The CHAIRMAN. That was information that you asked from the bureaus?

Admiral BENSON. From the bureaus, yes. But, as I remember it, the order was signed by the Secretary.

The CHAIRMAN. What I asked you was if at any time you directed all the bureaus to make preparations for, or to anticipate, war in accordance with any well considered plan, previous to February, 1917; and if so, when?

Admiral BENSON. I can not recall any such order.

The CHAIRMAN. You can not recall such an order?

Admiral BENSON. I can not; no, sir.

The CHAIRMAN. Did you receive instructions to give any such order?

Admiral BENSON. I do not think so. If I had, I should have carried it out, sir.

The CHAIRMAN. Did you have any plans, any specific plans?

Admiral BENSON. Only such as I described yesterday, sir.

The CHAIRMAN. No specific plans so far as the bureaus were concerned?

Admiral BENSON. Not a regularly drawn up plan; no, Mr. Chairman.

The CHAIRMAN. Did you have any direct or explicit instructions from the Secretary of the Navy that authorized you to make thorough preparations for war, even as regards plans?

Admiral BENSON. I do not recall any.

The CHAIRMAN. Did the policies or the instructions of the Secretary encourage or discourage plans and preparations of the fleet for actual war as regards personnel, material, or organization?

Admiral BENSON. The general policy of the Secretary was that what we had, as he repeatedly insisted on, must be kept up 100 per cent ready in every way. That was his general announced policy.

The CHAIRMAN. Nothing to do with any war?

Admiral BENSON. No; I do not think war was specifically mentioned; but as I stated yesterday, the policy is that the Navy should always be ready with what it has, 100 per cent; and that was the Secretary's announced policy, that he wanted everything 100 per cent.

The CHAIRMAN. And of course he did not get it. You have testified that, yourself, that it was not 100 per cent.

Admiral BENSON. Well, sir, if I testified, my testimony stands, that is all.

The CHAIRMAN. Would you not say that now?

Admiral BENSON. It was not 100 per cent ready, no.

The CHAIRMAN. You think that the Chief of Operations should have some authority over the bureaus and other agencies, always subject to the supreme authority of the Secretary?

Admiral BENSON. I do.

The CHAIRMAN. That is to coordinate and make plans and preparations for war?

Admiral BENSON. Yes; it is absolutely necessary for the efficient working of a technical department like the Navy Department that there must be some technical head to coordinate the activities of all, to secure efficiency.

The CHAIRMAN. And you would like to see that brought about.

Admiral BENSON. I would. I think it absolutely necessary for efficient functioning, and preparation of the Navy for war.

The CHAIRMAN. What would have been the result if we had had no Office of Operations and no Planning Section in 1917?

Admiral BENSON. The good Lord only knows!

The CHAIRMAN. Chaos?

Admiral BENSON. No, I do not think we would have had chaos, exactly, but I think you would have had a very different story to tell.

The CHAIRMAN. Do you know who was responsible for initiating or establishing the Office of Operations?

Admiral BENSON. No, I do not.

The CHAIRMAN. Are you familiar with the general principles of the organization proposed by the Mahan-Moody commission and confirmed by the Swift board?

Admiral BENSON. No, sir; I am not.

The CHAIRMAN. So that you do not consider the present organization of the Navy Department all that could be desired, as you have stated in your testimony?

Admiral BENSON. As I have stated, and what I thought ought to be done. I would not change the bureau system or anything of that kind. I would simply give what I have stated there, to the Office of Operations.

The CHAIRMAN. You stated yesterday that there was some action taken by the department in preparing and inspecting and listing vessels, yachts and merchant vessels, in the United States that might be needed in case of war?

Admiral BENSON. Yes.

The CHAIRMAN. How was that done? Through what organization was it done?

Admiral BENSON. It was under my office. The board of inspection was increased, I think, by two or three members, and the General Board made a study of all the requirements of different types of vessels that might be used as auxiliaries in regard to all particulars, the equipment that would be necessary for them, the fleet, etc. Then that list of requirements for the different types was turned over to the inspection board. The board was directed to inspect all the vessels in the country and, after comparing the requirements for each type, to assign the vessel inspected to the particular type for which it was best suited, and to report the necessary changes that would be desirable and the equipment that would be needed. Those reports came to my office and were gone over and then referred to the General Board and a careful list of them kept. I think copies of them were also sent to the various bureaus concerned. The bureaus were directed to make the necessary drawings and plans for the alterations and a list of the supplies and the equipment necessary, and they were sent to the yards to which the particular vessel would be directed to go in case it was taken over, and the yards were directed to make all possible preparations they could for meeting

that particular situation, and those things were all on record, and as far as possible the equipment was provided out of the appropriations that were on hand, and every possible effort that could have been made was made, so that in case of war we kept track of the vessels, where they were operating, so that we would know just where they were and when we could take them over, and all that was followed out during the period before the war, and that information was utilized as soon as we went into the war. I do not think there was any one detail that could have been anticipated before we entered the war with what we had that was not considered and prepared for; not one single thing. I can not recall now, as I look back upon it, a single thing that we could have anticipated that we did not.

The CHAIRMAN. So that after the declaration of war and after the department had the authority to commandeer these vessels they could have been immediately taken over?

Admiral BENSON. Yes, sir; most of them were taken over—a great many of them—as fast as they were needed. They were turned over, with the exception of certain vessels that we felt were needed more for some other purposes. For instance, take the ocean-going tugs. We did not take them over, naturally, for a very good reason.

The CHAIRMAN. And in all cases where you took them over, were supplies immediately on hand, and was personnel ready to put on them, so that it was only a question of a day or two after you had the authority to take them over?

Admiral BENSON. That depends. I do not imagine they were all ready, and I question very materially whether they were in personnel. Each one would have to be taken up separately to answer that. I think that in every case they were not ready.

The CHAIRMAN. You do not think that everything was ready?

Admiral BENSON. No, sir; not in all respects. I do not think it was. Of course, in taking over ships the whole crew, the officers and crew, were taken in, often; and in that way many of them were ready to operate right away, with a little additional personnel.

The CHAIRMAN. Was there any scheme to designate gun installations, assign batteries, and decide upon the necessary personnel to quickly fit such vessels for naval service?

Admiral BENSON. Yes, sir; a very definite scheme. Every detail was worked out, and we knew, beforehand.

The CHAIRMAN. The details were all worked out beforehand, and carried out?

Admiral BENSON. They were carried out also.

The CHAIRMAN. You have just stated that you did not think everything was ready in all respects.

Admiral BENSON. I thought you referred to guns.

The CHAIRMAN. My question covered more.

Admiral BENSON. I can not say about that; but the question was as to the matter of guns and the placing of guns.

The CHAIRMAN. My question was, was there any scheme to designate gun installations, assign batteries, and decide upon the necessary personnel to quickly fit such vessels for naval service.

Admiral BENSON. Those were all in the plans I spoke of that the General Board supplied for each ship or vessel that we took. Those details were all worked out. I thought you referred to the delay in getting the personnel on board, and preparing.

The CHAIRMAN. The details were worked out, but the question of getting the personnel ready and the supplies and other matters that would be needed on the ship, you state were not ready.

Admiral BENSON. I do not think that they were always ready, in every detail.

The CHAIRMAN. It was a very important matter that they should be ready, was it not?

Admiral BENSON. Necessarily.

The CHAIRMAN. Now, if the ships, large and small, of the Regular Navy had been systematically prepared and made ready as regards material in the years 1914, 1915, and 1916, would not our navy yards have been cleared and more free to undertake new construction, and to quickly prepare yachts and merchant ships for war?

Admiral BENSON. Well, that is equivalent, as I understand—well, yes.

The CHAIRMAN. Had the above policy been in force, could we not have had a large force of destroyers, gunboats, yachts, and small vessels ready to throw into the war zone in the first month of the war?

Admiral BENSON. Not without special appropriations and provisions for destroyers and yachts, we could not have had; that is, for the new ones. I am talking about those we had on hand.

The CHAIRMAN. And if we had the immediate right to commandeer immediately on our entrance into the war, we could have had the yachts, too, could we not?

Admiral BENSON. Necessarily, if we had had the vessels there and they had been all ready, they could have been gotten over sooner.

The CHAIRMAN. They could have been gotten over sooner?

Admiral BENSON. Yes.

The CHAIRMAN. They could have been gotten over the first month of the war, could they not?

Admiral BENSON. If we had had the vessels and they were ready, we could have sent them over.

The CHAIRMAN. If we had prepared all our plans beforehand in regard to it?

Admiral BENSON. Not plans. We had to have something else besides plans.

The CHAIRMAN. I say if we had had prepared all our plans for getting ready the personnel and material before the war, and then immediately on the declaration of war had asked Congress to authorize the commandeering of the vessels, we could have sent them over within a day or two, could we not, or a few days?

Admiral BENSON. Oh, I do not think so.

The CHAIRMAN. Why not?

Admiral BENSON. Why, the question is too involved, Mr. Chairman. This is a tremendous proposition of handling the Navy and keeping it going, and every little detail of that kind. You can not possibly ship over and send a large force across that way to meet the enemy.

The CHAIRMAN. It was a question of war. We had many tremendous propositions.

Admiral BENSON. We could not do it immediately. It was impossible.

The CHAIRMAN. I am asking you why not; why could you not?

Senator PITTMAN. Let the Admiral finish his answer. He should be treated with courtesy.

Admiral BENSON. To begin with we did not have the vessels.

The CHAIRMAN. There is no discourtesy. That is not what I asked you, Admiral. I asked you if you had made your plans in regard to these things, and you said you had lists of vessels all prepared, and materials procured, and so on.

Now, I ask you if, with these means all prepared, and if everything had been prepared to be put on these vessels as soon as you could take them over, and then the Secretary had gone to Congress and asked for the right to commandeer them at once, why could not they have been all ready within a few days?

Admiral BENSON. Well, sir, I can only answer by saying that if we had had the vessels and they had all been ready we could have sent them over.

The CHAIRMAN. As far as the appropriation is concerned, the emergency appropriation that was passed some time in March covered that, did it not?

Admiral BENSON. In February, I think it was, sir.

Admiral McKEAN. In February; \$115,000,000.

Admiral BENSON. As I understand, your question is if it had been determined in February or March that we were going into war——

The CHAIRMAN. That we were pretty sure to go into the war, and if everything had been gotten absolutely ready in case we should go into war; yes.

Admiral BENSON (continuing). If we had done that, and taken all these vessels and put them in the yards and gotten them absolutely ready, and decided to send them over there in the first month of war, it could have been done.

The CHAIRMAN. Would not this have been a wise and comparatively inexpensive policy?

Admiral BENSON. Judging from subsequent events, it would.

The CHAIRMAN. Would not the moral and material effect of such quick and determined action have been greatly to encourage our Allies and greatly to discourage Germany?

Admiral BENSON. From my experience with the representatives of the Allies, I think we did more than they really expected us to do, and I doubt if it would have added very much to the moral effect.

The CHAIRMAN. They did not expect us to send any troops over there at all to fight, did they?

Admiral BENSON. I do not think they did, in the beginning.

The CHAIRMAN. And if we had shown them by a very quick naval offensive that we were going to do our part in the war, would not that have had a great moral effect?

Admiral BENSON. I do not think it would. I think we did so much, we did more than they asked for.

The CHAIRMAN. Did we show it in April, particularly?

Admiral BENSON. I think we did show it.

The CHAIRMAN. How; by sending six destroyers?

Admiral BENSON. When they only asked for two.

The CHAIRMAN. That shows that they did not expect very much from us; that they only expected two, does it not?

Admiral BENSON. I do not know what they expected. I am only talking about what they had asked for.

The CHAIRMAN. You think if they asked for only two destroyers and we sent them six, that it had a tremendous moral effect, do you?

Admiral BENSON. No; I do not think it had a tremendous moral effect, but I think we were giving them more than they asked for or expected.

The CHAIRMAN. If we had sent 100 or 75, do you not think that it would have had a greater moral effect?

Admiral BENSON. It would have had a greater moral effect; but they did not ask for anything of the kind. That does not mean that they did not want it.

The CHAIRMAN. Oh, no; that does not mean that they did not want it.

Admiral BENSON. I say they did not say they wanted it.

The CHAIRMAN. Did you not know that they had sent word through Admiral Sims that they wanted them?

Admiral BENSON. Not that I remember.

The CHAIRMAN. Did he not say that they wanted all the ships that we could possibly send over?

Admiral BENSON. Something of that kind; but they knew that we could not send any one hundred and thirty odd destroyers.

The CHAIRMAN. Certainly not; but they had asked us to send over vessels.

Admiral BENSON. What would they have done with them?

The CHAIRMAN. What?

Admiral BENSON. What would they have done with them? Suppose we had sent cruisers and other things over there, what would they have done with them?

The CHAIRMAN. I am asking you now about these gunboats and yachts and vessels that they wanted for fighting submarines.

Admiral BENSON. They could not fight submarines with gunboats and yachts, very well.

The CHAIRMAN. Were they not of some value?

Admiral BENSON. They were of some value, yes; because the German submarines were depending on the destruction of merchant ships by using bombs instead of torpedoes; and to that extent they were of some service; but otherwise they were not.

The CHAIRMAN. I thought you spoke of them as of very considerable service in this country, in defending our coasts.

Admiral BENSON. They were, to that extent, getting information and protection.

The CHAIRMAN. Would they not have been of some use there?

Admiral BENSON. Of some use, but not very great use.

The CHAIRMAN. They were sent over there?

Admiral BENSON. They were sent over, and were used for convoy and escort work; and they were used for bombs and to help in every way they could.

The CHAIRMAN. Even the fact that they were sending them over and taking that much part in the war would have had a moral effect, would it not?

Admiral BENSON. To a certain extent; but I think there was never any question in any of the Allies' minds as to the attitude of the United States in regard to the question, as I recall it, at any time.

The CHAIRMAN. There never was what?

Admiral BENSON. Any question in the minds of the Allies as to the whole-souled part that the United States was taking in the war, and would take.

The CHAIRMAN. I thought you said they did not expect us to send troops over.

Admiral BENSON. I do not think they did in the beginning.

The CHAIRMAN. Would it be whole souled if we were not going to send troops over?

Admiral BENSON. That was their attitude at the time, and I do not think there was any question of that. I do not think that the Allies thought at any time that we would not send troops if they wanted us to. I think the idea was that we would send troops when they could be properly utilized, and they were prepared for it. That is as I remember the situation.

The CHAIRMAN. You do not think that at the outbreak of the war they wanted us to send troops?

Admiral BENSON. I do not think it was generally expected, and it was not well decided—just as I remember. Of course, I was not kept informed as to that phase of it. I am only speaking from memory, from the impression on my mind.

The CHAIRMAN. They may not have expected us to, but at least they would have wanted us to?

Admiral BENSON. I could not say from my knowledge that they did. I would imagine that they would, but I could not say so. I should imagine they would be glad to get anybody to help them.

The CHAIRMAN. The hour of 12 having arrived, we will adjourn until 10 o'clock to-morrow morning.

Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Thursday, May 6, 1920, at 10 o'clock a. m.

NAVAL INVESTIGATION.

THURSDAY, MAY 6, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235 Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present, Senators Hale (chairman), Ball, and Pittman.

TESTIMONY OF ADMIRAL W. S. BENSON—Resumed.

The CHAIRMAN. The committee will come to order. Admiral, after we declared war should we have waited for the Allies to ask us, or should we have waited to find out, what they wanted before sending all available forces to the war zone?

Admiral BENSON. We should have gotten in touch with them and found out what conditions were and under what conditions they wanted us to cooperate with them before we sent them over.

The CHAIRMAN. You said yesterday, because we sent six destroyers over when they asked for two, that you thought we were doing very well, did you not?

Admiral BENSON. In comparison with their request; yes.

The CHAIRMAN. Admiral Mahan says, in the matter of preparation for war:

One clear idea should be observed first by everyone who recognizes that war is still a possibility and desires to see his country ready. However defensive in origin or character a war may be, the assumption of a simple defensive in war is ruin. War, once declared, must be waged offensively and aggressively. The enemy must not be fended off, but smitten down.

Do you believe in Mahan's principle, not to fend off but to smite down an enemy, once war is started?

Senator PITTMAN. Just a second, please. Has the chairman that work in his possession from which that extract is taken? The reason that I ask is this, that in the cross-examination of a witness, particularly by long prepared questions of that kind, there should be opportunity to ask him further from that same work.

The CHAIRMAN. I have not the work here, but I have the quotation, and I can get it.

Senator PITTMAN. Very well.

Admiral BENSON. Why, of course I agree with the general principle expressed there by Mahan.

The CHAIRMAN. You do agree with the general principle expressed?

Admiral BENSON. I do agree with the general principle.

The CHAIRMAN. Do you think, then, that waiting until we were advised just what ships or men were needed on the other side was a very aggressive policy for us to follow?

Admiral BENSON. I do not think it was aggressive, but I think it was in absolute keeping with the actual conditions which confronted the country.

The CHAIRMAN. So that Mahan's principle as laid down there would not have applied at the beginning of this war, in your opinion?

Admiral BENSON. Any principle has to be modified by actual conditions. Those are only general principles, which are carried out as far as the conditions warrant.

The CHAIRMAN. When did you first anticipate that we would become involved in this war?

Admiral BENSON. Well, as I stated in the beginning of my testimony, I felt—had felt for some years—that eventually we would be involved in war with Germany. Just when I felt that we must be involved with the Allies it is difficult and really impossible for me to state. In fact, I do not know that I ever fully came to that conclusion, but I felt that, as I stated, I had very serious doubts as to the ultimate outcome of the war between the Central Powers and the Allies, and that when we would become involved would depend very largely on when that question would be settled.

The CHAIRMAN. What question?

Admiral BENSON. The war between the Central Powers and the Allies.

The CHAIRMAN. That is, you thought that we would not go in until either the Allies had whipped Germany or Germany had whipped the Allies?

Admiral BENSON. I thought that would be the possible outcome: yes.

The CHAIRMAN. You did not think that we would go into the war after the Allies had whipped Germany, did you?

Admiral BENSON. I had very serious doubts as to the Allies whipping Germany.

The CHAIRMAN. Well, but that was one of the questions. I asked you whether you thought we would get in after the Allies had whipped Germany or Germany had whipped the Allies.

Admiral BENSON. Oh, I did not understand. After Germany had whipped the Allies.

The CHAIRMAN. After Germany had whipped the Allies?

Admiral BENSON. Yes; that was one of the possibilities that I looked forward to.

The CHAIRMAN. And you did not think there was much chance of our getting in with the Allies so as to avoid having them whipped by Germany?

Admiral BENSON. I thought there was a chance, but just how great it was I can not say now. I can not go back and analyze just what my feelings were at the time.

The CHAIRMAN. You did not think at the time that it would be a good thing for us to wait until Germany had whipped the Allies, did you?

Admiral BENSON. I thought it would be a good idea for us to be prepared as well as we could for whatever course events might take.

The CHAIRMAN. But you would not have considered it a good policy for us to wait until that event, would you?

Admiral BENSON. It depends entirely on the development of the situation. We might not have been warranted in going to war with Germany until she had committed some act that made it absolutely necessary for Congress to declare war in response to the feeling of the people of the country.

The CHAIRMAN. And you do not think that prior to April 6, 1917, Germany had committed a number of such acts?

Admiral BENSON. She had committed a number of such acts, but I do not think that it is for me to criticize or to express an opinion as to the course followed by my Government, sir.

The CHAIRMAN. In any event, you considered that war was a very probable thing, did you not?, for us?

Admiral BENSON. Yes; I did in 1917.

The CHAIRMAN. Did you ever have any doubt as to which side we should fight on?

Admiral BENSON. Never. Well, I might put it in this way: I thought that there were certain things going on that we ought to be prepared for in emergency. Our ships were being held up and certain things were going on that might make it necessary for us to take a definite stand. I never had any idea that we would have to fight any other country; no.

The CHAIRMAN. Did you ever have any idea that we could possibly fight on the side of Germany?

Admiral BENSON. No, sir.

The CHAIRMAN. Or that we could fight with any of the Allies against any of the Allies; that there was any danger of any such thing?

Admiral BENSON. I do not think any such idea ever crossed my mind.

The CHAIRMAN. What instructions did you personally give to Admiral Sims before he went abroad?

Admiral BENSON. The only particular instructions—I can not recall what instructions I gave him. I cautioned him to be very careful in his conduct in regard to how he conducted himself, and called to his attention the very delicate situation that existed. War had not been declared, and that we were directed to maintain a strictly neutral position; to keep it in mind. I gave him very earnest instructions along that line.

The CHAIRMAN. The admiral has stated that you said to him, "Do not let the British pull the wool over your eyes. It is none of our business, pulling their chestnuts out of the fire. We would as soon fight the British as the Germans." Do you recall having made such a statement?

Admiral BENSON. I do not. It would be impossible for me to repeat the language that I used to Admiral Sims. As I recall it, the conversation that I had with Admiral Sims took place in Admiral Palmer's office. Admiral Palmer was the chief of the Bureau of Navigation and our personnel division, and the question of definite instructions to Admiral Sims—they were given by the Secretary, or someone else, not by me. As I recall it, he did not even come to my office. When I was asked as to his being selected, I strongly approved of it, and the conversation that he refers to must have been that one, because I can not recall any other. Just what language I used it would be impossible for me to say. I will say, however, that I felt very strongly on the situation, and I probably used very forcible

language, and impressed upon him the seriousness of the situation and the importance of being very careful that his feelings toward the British did not lead him into any indiscretion. The language I used I can not recall. If Admiral Sims states positively that I used that language, why, it will have to go at that.

The CHAIRMAN. You do not deny that you used that language?

Admiral BENSON. I can not deny it, Mr. Chairman. I can deny most strongly, and do, that I ever intended that it should be interpreted as it has been, by the interpretation which has been attempted to give to it. I deny that most strongly. I think my record will indicate that I am not stupid, and that I understand the international situation; I understand that Congress alone can declare war; and it was language that was used under the circumstances, used only in the presence of the Bureau of Personnel, where the question of sending Admiral Sims abroad was discussed, and I considered that it was done in the most confidential and earnest and officerlike manner. I do not think anything could have been more confidential or more earnestly gone into than my conversation with Admiral Sims.

The CHAIRMAN. How could you say at that time that we would as soon fight the British as the Germans?

Admiral BENSON. Merely as a figure of speech, Mr. Chairman, to impress upon him the delicacy of the situation and the importance of conducting himself with great care.

The CHAIRMAN. Did you repeat these instructions, or at least a part of them, at a later period to Admiral Sims?

Admiral BENSON. The only other thing that I can recall was that when I went to London in 1917, and before I left this side, there was a feeling that through some influence or other Admiral Sims was being persuaded to give too much attention to British shipping, and that our destroyers were being used too much for that and too little for our own vessels. I do not mean to say that that feeling was justified, but I knew that it existed, and when I went to London I had always been, as I considered myself a very strong personal friend of Admiral Sims, I had had great admiration for him and for the work that he had done in the target practice work, and in addition to my official position and the obligations that I owed to the situation, I had a friendly feeling; and I had a talk with him and told him what the feeling over here was; that this feeling was growing up, and that there was a feeling that he was being influenced unduly by the British, and that I would advise him as a friend to be more careful about it, for his own sake as well as for the sake of the duty he was performing, and that it was so. That is the only conversation I can recall, and I am as positive as I can be, at this length of time, that it was the only time I referred to anything that was similar. That I repeated that language or anything of that particular kind I think is absolutely untrue, sir.

The CHAIRMAN. No; I do not think there is any question of repeating the latter part of the language, that to the effect that we would as soon fight the British as the Germans, at the second interview.

Admiral BENSON. Then you asked me about another case. In 1918 Admiral Sims had made certain remarks, I think, to different people who had gone over, and there were certain things in the press in which he had made remarks that were not considered quite proper with reference to the part that we were playing in the war, and the

preponderating effort, and so forth, of the British as compared with the American effort; and I realized I heard that commented on here before I went over, so that when I met Admiral Sims in Paris in 1918, the first private conversation I had with him I called his attention to that. I said that this feeling was growing up here in the country at home. I said, "You have not been home for some time, and simply as a friendly act to you I want to tell you what the feeling is at home, that you are gradually creating an impression with the people at home that you are entirely too favorable to the British, and I simply advise you as a friend to be more careful with your remarks, with your speeches, and things of that kind, because if you are not I am afraid you will create a prejudice that will do you harm in the future." And that was the only way I did it. I did it, as I say, with regard to my official position and with my feeling as a brother officer; and never had I any intention of conveying to him or anyone else any such impression as that language intimates there. And I would like to say to the committee that I feel I have been done a most grievous injustice by its being brought out.

The CHAIRMAN. Being brought out, you mean, by Admiral Sims?

Admiral BENSON. By Admiral Sims, yes, sir; by Admiral Sims.

The CHAIRMAN. But you do not deny that you used the language that is quoted by Admiral Sims?

Admiral BENSON. I can not deny it, Mr. Chairman.

Senator PITTMAN. At what time, in the first conversation, or in his conversation in London?

Admiral BENSON. I can not deny that I used it in the first conversation. I do deny that I used that language in any other.

The CHAIRMAN. But in the second conversation you do not deny that you used the words that the Admiral should not allow the British to pull the wool over his eyes?

Admiral BENSON. I can not deny that I did use that language at that time. It is possible. I do not believe that I did, but I will not deny it. Under oath, I can not deny that I did use it. Time is too long. My time was taken up—

The CHAIRMAN. There has never been any accusation that you used the language about that we would as soon fight the British as the Germans, at any time after we entered the war?

Admiral BENSON. I could not, sir, say about that language at this time. It is impossible for me. You must realize the tremendous task that I had. I simply gave my whole attention to each day's duty as it came to me. I had, as I felt, a perfect grasp of the whole field, and the bearing of one part of it to another, and I had very definite ideas in my own mind as to how best to carry on that duty, and I went ahead with it. I did not anticipate any future action, to myself or anybody else, and I did not take note and burden my memory with details with reference to what the future consequences might be.

The CHAIRMAN. Did you wish, or seek, to impress Admiral Sims with the importance of energetic action on our part?

Admiral BENSON. No; I do not recall that I did.

Senator PITTMAN. Mr. Chairman, before you leave that I just suggest to you—because otherwise I can bring it out later—that your questions there confuse his denial as to the conversation before Admiral Sims left here, and his denial with regard to what conversa-

tion he had with Admiral Sims over there. As I understand the Admiral—and if it is not true I think the chairman might develop it further—he does not remember whether he used this language charged by Admiral Sims as having been used by him, before Admiral Sims went over there, because he does not remember it. He does not deny it. He does deny emphatically that he used any of the language attributed to him by Admiral Sims in any conversation after the war commenced.

The CHAIRMAN. I do not think you are right, Senator.

Senator PITTMAN. I say that is the impression I get, and I suggest it, so that you can bring it out further.

The CHAIRMAN. You do not deny that at the second interview referred to, you did advise Admiral Sims not to let the British pull the wool over his eyes?

Admiral BENSON. I say I could not deny that, any more than any other. I do not believe I did, Senator, but under oath I could not say and would not say that I did not use it; but I do not believe I did. I can not imagine why, except the fact that it was felt that he was being influenced. It is possible that I might have used that language. I will not say, as I analyze it now, in my own mind. It is possible that I might have used that language, but I do not believe I did. And I want to say here that I have never had any unkindly feeling or anything of the kind that that quotation would indicate. The reason given, as I remember the testimony, that he knew that I was strongly anti-British—I do not think I have ever had a conversation with Admiral Sims on the question of how I felt toward the British. The feeling that I had at that time was one of enthusiastic cooperation and a feeling of pride.

The CHAIRMAN. Have you ever had conversations with other officers about your attitude toward the British?

Admiral BENSON. I have, in certain respects. I often speak, and, for instance, since the war particularly, I have had very decided feelings with regard to the question of our commercial competition. Not otherwise. And I deny now any unfriendly feeling.

The CHAIRMAN. You had no unfriendly feeling—

Admiral BENSON. No, sir; I did not.

The CHAIRMAN (continuing). At any time during the war?

Admiral BENSON. No, sir; absolutely not. To the contrary, and I state that it places me in this embarrassing situation. In my conversation with the British high officials it was, I said, a source of personal gratification to me that the two services were fighting side by side for the betterment of mankind, and so on.

The CHAIRMAN. The committee does not want to treat you in any way unfairly, Admiral. We want to give you every opportunity to answer.

Admiral BENSON. I wanted that brought out, that it has embarrassed me. It makes it practically impossible for me to ever visit Great Britain again in the way that I would like to. I have some very intimate and very dear friends there. The British Government has seen fit to decorate me with one of its principal decorations. And I hope that it will be appreciated, the position that I have been placed in.

The CHAIRMAN. Were your instructions to Admiral Sims calculated to impress him with the fact that we would fight against Ger-

many, and that we would hit hard and quickly as soon as we entered the war?

Admiral BENSON. I did not consider that necessary. I do not think I gave him any such instructions, Mr. Chairman.

The CHAIRMAN. Was the condition of the Navy as to personnel at the time of our entrance into the war satisfactory?

Admiral BENSON. No, sir.

The CHAIRMAN. From your knowledge of the Navy and of naval affairs, do you think that the Secretary of the Navy, in the years just before we entered the war, made the representations to Congress that he should have made concerning the condition of the Navy as to personnel?

Admiral BENSON. No, I do not think he did.

The CHAIRMAN. In submitting plans preparing the Navy for war, did you ever find difficulty in getting the Secretary to take favorable action?

Admiral BENSON. Well, that is a rather sweeping question, Mr. Chairman. I think this, that the Secretary sometimes took a good deal of time in his deliberations, and there were times when he did not approve of all of the recommendations that were made to him; but just what they were now I would have to refer to the records to determine, and I do not think that even then I could tell just which ones he did not approve and which ones there was delay on. I always felt, however, that the Secretary was weighing the questions carefully, and I can say very decidedly that I believe that in any delay or declination to approve plans or policies or whatnot, he was carefully weighing the whole situation, and that he acted in accord with what he thought was in keeping with the general policy that was to be pursued at the time. I will add that there was never—I do not believe there was ever—any intentional or deliberate delay or refusal.

The CHAIRMAN. Then would you say that the Secretary always acted promptly in approving the plans and policies that your office submitted to him?

Admiral BENSON. I would not say so, and I do not think he did, always.

The CHAIRMAN. Some of the witnesses have testified that in dealing with the Secretary they found a disposition on his part to procrastinate. The other day Senator Pittman objected to that form of question, and I put in the record statements of witnesses to which I assumed I had referred.

Senator PITTMAN. I will state also, since you call attention to what I protested against, that the cases you put in the record were in regard to certain particular instances, and not with regard to his general action. I still contend that it does not in any sense prove the contention you were trying to establish, that the Secretary was guilty of general procrastination.

The CHAIRMAN. Would you like to have me put the same references in the record at this point? It seems to me it would be simply encumbering the record.

Senator PITTMAN. It would. I have only stated you were drawing certain conclusions, as a foundation for the question, and I deny the conclusion.

The CHAIRMAN. I will ask the stenographer to read the question I asked the admiral.

(Part of the last question by the chairman was read by the stenographer as follows:)

The CHAIRMAN. Some of the witnesses have testified that in dealing with the Secretary they found a disposition upon his part to procrastinate.

The CHAIRMAN. Did you find any such disposition in your dealings with the Secretary?

Admiral BENSON. I do not think you could put it in the way of a procrastination. I do think that the Secretary frequently delayed action on matters that were put before him; but I think it was almost invariably due to desire to give it careful consideration, and probably to consult with other people as to the best way he should act on the particular thing. Undoubtedly he was given to a certain extent to that method of operation, just as one man differs from another in the methods that he pursues, whether he is of quick decision or slow, and so on. But, as I have said, I do not think it was ever prompted by any deliberate intention to delay action or to deliberately block any effort that was being made for the best interests of the service or the country.

The CHAIRMAN. You never, in your dealings with the Secretary, found a disposition to pigeonhole certain matters and put off dealing with them?

Admiral BENSON. Certain matters were put off—were pigeon-holed; yes, they were.

The CHAIRMAN. Certain matters that it would have been much better to have taken up promptly?

Admiral BENSON. In my opinion; yes.

The CHAIRMAN. And you were not given the reasons for the pigeon-holing of these matters—any satisfactory reason?

Admiral BENSON. Not always; no. I always assumed that he had his own reasons for it, and as he was the responsible head of the Navy, I did not always seek reasons for it, sir.

The CHAIRMAN. But did it not occur to you that in some cases they were simply being let slide?

Admiral BENSON. I think in some cases they were let slide; yes.

The CHAIRMAN. Was there a sound, complete, and well-defined plan for conducting this particular war ever drawn up before war was declared, so far as you know?

Admiral BENSON. For this particular war, I do not think so; only such general plans or policies as I have already outlined.

The CHAIRMAN. When was it?

Admiral BENSON. There was a plan submitted to the General Board, the one that has been referred to in the evidence of some of the other witnesses as having been lost, and as I said yesterday, Mr. Chairman, my duties covered the whole field, and when a certain line of policy was to be pursued, I discussed it with my aides and others, and left the question of plans to be drawn up by them, and as there were certain phases of it that it was almost impracticable to draw up very definite plans, and the people concerned were kept sufficiently well informed as to what we were doing and our policies, the weekly conferences with the Secretary of the Navy in his office and the chiefs of bureaus and heads of offices kept everybody well posted up to date, as to just what our policies were and what we were doing, so that there never was any question as to what our policies and ideas were, and there was no question in carrying them out.

The CHAIRMAN. But there was no definite war plan drawn up? Admiral BENSON. No definite war plan drawn up on paper; no, Mr. Chairman; there was not.

The CHAIRMAN. There was later on, was there not?

Admiral BENSON. I can not say whether there was or not?

The CHAIRMAN. Did not Capt. Laning draw up such a plan?

Admiral BENSON. I could not say, now, whether he did or not.

The CHAIRMAN. Was not that in your office?

Admiral BENSON. He was in my office at the time; yes, sir. I have read the evidence, and it states that he did submit one, but I can not recall it now. It would be impossible for me to recall it.

The CHAIRMAN. Was it ever used?

Admiral BENSON. That I can not say, either. As I said just now, I had charge of the general field and gave orders to carry out such plans as were drawn up as were material, to execute the policies and ideas that I had and intended to carry out, and were carried out. Whether they were carried out exactly along the line of the plan drawn up by Capt. Laning or anyone else, I could not state at this time.

The CHAIRMAN. As Chief of Operations you know what plans were used, do you not?

Admiral BENSON. I could not tell you now, Mr. Chairman, just what plans were drawn up. All I can say is that I had charge of the general field of operations, and I kept in close touch with every movement, and gave the necessary orders to carry out those policies, and to execute what would have been a plan if it was drawn up; but as to whether it was drawn up on paper or not, I could not say. All I can say is that we accomplished the results we started out to accomplish.

The CHAIRMAN. And you are not familiar with the details of Capt. Laning's plan?

Admiral BENSON. I am not, sir.

The CHAIRMAN. And you do not know whether or not it was the plan adopted by the department?

Admiral BENSON. No, sir; I do not.

The CHAIRMAN. Did the Secretary of the Navy direct that a well defined plan be drawn up before the war started?

Admiral BENSON. I do not think he did. I can not recall his having done so.

The CHAIRMAN. You feel that the Secretary of the Navy by every test, and by the energy and foresight he displayed, had a tendency to put a push and drive into the Navy that it should have to win a war?

Admiral BENSON. I think from that particular viewpoint, he did all that could have been expected of him.

The CHAIRMAN. Before the commencement of the war and during the war?

Admiral BENSON. I think he showed efficiency, and always pushed everything as much as he could; that is towards the spirit of trying to do the right thing. As I said in the beginning, I had a free hand except in certain minor things and questions involving appropriations, and things of that kind; but so far as the operations were concerned, there was no interference.

On the other hand, more than once the Secretary sent for me and spoke in regard to various operations and insisted that he must use every effort to carry them out successfully and energetically, and I believe that he did do in that respect everything that could have been expected of him.

The CHAIRMAN. This was after we had gone into the war.

Admiral BENSON. After we had gone into the war, yes.

The CHAIRMAN. You do not feel that he took such an attitude before the war, do you?

Admiral BENSON. I think he took the attitude that everything we had should be as nearly as we could keep up to the proper standard of efficiency and preparedness as the circumstances would permit.

The CHAIRMAN. That is in general, not with respect to this particular war?

Admiral BENSON. In general and not with regard to this particular war, no; I can not say that he did.

The CHAIRMAN. And after the war started, you felt that he did everything in his power to drive us to an offensive war, do you?

Admiral BENSON. I do not know just how you want to use that word "offensive," there, Mr. Chairman. You discussed the question that our attitude was defensive, and I would like to be a little careful.

The CHAIRMAN. Did he not advocate an offensive war?

Senator PITTMAN. I suggest that the writer of those questions ought to be more definite.

Admiral BENSON. I will state that in this way; he did everything he could to carry out the policies that we decided to carry out. Now, whether you consider that an offensive war——

The CHAIRMAN. What push and drive did he put into all of his actions; whether he tried to drive the Navy along toward an offensive war rather than a defensive war?

Admiral BENSON. I can probably answer that in this way; that I felt that the Allies were not making a sufficiently active offensive against the enemy, as far as the Navy was concerned. We felt that the enemy's seaports should be attacked, and we felt that very strongly, and tried to impress it in various ways on him, and I do know that the Secretary was heartily in sympathy with that and often referred to it. He sent for me more than once to know if it was not possible for us to do something in a more active way to send our ships over there; if we could not send some of our older battleships to attack the ports where the German submarines were coming out of. More than once he spoke to me on that subject; that I can recall very distinctly.

The CHAIRMAN. That was directly against the Allies?

Admiral BENSON. That was directly against the enemy.

The CHAIRMAN. I say, that was directly against the plans of the Allies?

Admiral BENSON. We never had any plans from the Allies at that time. I do not think we ever got any plans from the Allies whatever, that I recall, until we sent our planning section over there, which I arranged for when I was in London in 1917.

The CHAIRMAN. It was directly against the recommendations which were made by Admiral Sims after his consultation with the British Admiralty, was it not?

Admiral BENSON. You mean against his recommendations?

The CHAIRMAN. Yes; this plan of attacking the enemy's ports.

Admiral BENSON. They did not think it practicable. We did not agree with them about that. We did not agree with Admiral Sims, or with the British, in that matter; never did fully agree.

The CHAIRMAN. And later on you, I think, acknowledged that you had been wrong on that, did you not?

Admiral BENSON. When I went to London, as I stated yesterday, I had a conference with Admiral Jellicoe, the First Sea Lord, and then he told me of a plan that they had, which he went over very carefully, to carry out this. I told him how we felt. For instance, I think they may have felt that I was carrying the point too far in urging offensive operations before I went over there. I could not understand why we did not take more offensive action, and when I went to London he showed me this very secret and confidential plan which we went over, and in which I agreed a certain element of our forces should be utilized in carrying it out.

The CHAIRMAN. That plan was not carried out, was it?

Admiral BENSON. I do not think it ever was fully carried out. Things developed later on, particularly with regard to certain schemes that they had for aircraft, that practically made it impracticable.

The CHAIRMAN. So that the ideas of the Secretary, as you have given them, about attacking the enemy ports, were not directly in line with the recommendations made by the British through Admiral Sims, and which were afterwards——

Admiral BENSON. No, sir; on the contrary they are decidedly more active and decidedly more offensive.

The CHAIRMAN. That is, they are not in line with the ideas of the French or the British?

Admiral BENSON. No, sir; they were decidedly more active and more offensive.

The CHAIRMAN. And they were dropped?

Admiral BENSON. Well, they were never carried out. Of course in the spring—in 1918 Admiral Keyes later on attacked Zebbrugge. That was a long time later, though.

The CHAIRMAN. In the first few months after the war, did you find any difficulty in getting the Secretary to ask Congress for funds to provide certain types of vessels needed in the war?

Admiral BENSON. I do not think there was any difficulty at all. I think that the only question that there was much delay about—and I do not think that was caused by anything except a final decision as to just what type would be best suited for the purpose, whether destroyers or chasers and other types, and there were recommendations made with regard to destroyers, for quantity production—I think Admiral McKean suggested one plan about getting them more quickly. But when that matter was referred to the technical bureau chiefs, the question of machinery and also the fact that we felt that only certain yards could do that work satisfactorily, were considered, and the Secretary after consultation with me and with the bureau chiefs, decided on the type that we would build, and then when that decision was made, the construction, as I feel, was pushed with all possible energy.

The CHAIRMAN. Do you recall a letter to the Speaker of the House about this matter?

Admiral BENSON. No, sir.

The CHAIRMAN. Written by the department, in any way?

Admiral BENSON. I do not, sir.

Senator PITTMAN. Have you the letter there, Mr. Chairman?

The CHAIRMAN. No.

Senator PITTMAN. If you have, I suggest that the proper way to examine the witness is to show him the letter.

The CHAIRMAN. I have not the letter. You do not recall any such letter?

Admiral BENSON. No, sir.

Senator PITTMAN. Have you ever seen that letter, Mr. Chairman?

The CHAIRMAN. I have not. I am not saying there was such a letter. I am simply asking the Admiral if he knows anything about it.

Senator PITTMAN. I would like to know if the committee knows anything about it.

The CHAIRMAN. Yes.

Senator PITTMAN. I think the person who is preparing those questions ought to be fair with the committee and give the committee the information, themselves.

The CHAIRMAN. I think the committee can handle that matter without outside help.

Senator PITTMAN. I of course realize that I am on the outside, but I am speaking of the right to put the question. I realize I am trying to get the information, and the Admiral who is writing those questions probably has some purpose in it.

The CHAIRMAN. If the Senator will recall the debate in Congress at an early stage in the hearings, he will remember that the committee asked for counsel to assist in prosecuting this investigation, and he will recall that the Senate did not allow counsel. Under the circumstance, I think it is very proper for the committee to get all of the assistance that it can get in framing questions to be put to the witnesses; and unless I am entirely wrong, the Senator has also asked questions in the framing of which he has been assisted by outside parties. Possibly I may be wrong.

Senator PITTMAN. I will state to the chairman that there are very few questions that I have ever asked that have been framed by any outside party. In fact, I have never asked a question that has been framed by an outside party. Not that they have not been submitted to me, but I have felt that the information that I desired to get could better be deduced by the interrogations that I put.

Now, the Senate did refuse this committee counsel, for the obvious reason that this was an investigating committee, or supposed to be, and not a prosecution. The will of the Senate has been avoided, apparently, by the committee not having counsel to prepare its questions but an admiral or some one of that type to prepare these questions, which the chairman is laboriously reading every day, and has been for a long period of time.

The CHAIRMAN. I think if the Senator will read the record he will see that most of the questions are not in any way prepared.

Senator PITTMAN. What I am objecting to is the repetition, the long delay, and the tremendous expense that is being involved in the reading of questions that are fired up here by messengers every day; and it is apparently not to get any information, because it is a duplication of what has been gone over.

The CHAIRMAN. I will ask the Senator if there is not a representative of the Navy Department sitting near him at this time, prepared to assist him with questions to be asked?

Senator PITTMAN. Undoubtedly, prepared to assist me; but I do not remember ever having asked a question that he ever prepared; because I feel as competent to propound questions as any one that happens to be here.

The CHAIRMAN. Then does the Senator think that the department should go to the enormous expense of keeping this man here to assist him with perfectly useless questions?

Senator PITTMAN. I do not think he is here for the purpose of assisting the Senator from Nevada with questions. He is here possibly for the purpose of ascertaining what testimony might be given here, as the Secretary may possibly be required to answer a great many questions, and it certainly will facilitate the examination to know what matters have come out in this manner.

The CHAIRMAN. Are there not certain officers of the Navy who have already testified as witnesses, who are being kept here in Washington at the present time to assist in this investigation?

Senator PITTMAN. Undoubtedly. It happens that the admiral and the captain who have been here the whole time have a more general knowledge of the facts than anyone else around here; and if our object was to bring out information, we would be delighted to have them here at all times.

The CHAIRMAN. I am not making any complaint about their being here, but I do not think the Senator can make complaint about our getting assistance from outside sources in carrying on the investigation, and we propose to do so.

Senator PITTMAN. The idea is this, Mr. Chairman, that this hearing has been dragging on three or four months, and I am satisfied that neither the chairman nor any other member of this committee would pursue this policy of asking over and over and over again the same questions if he was conducting it himself, and if he were not simply reading questions prepared by somebody.

The CHAIRMAN. The Senator knows very well we are not conducting it in that way. There have been a number of questions suggested by outside parties, and there will be from now on. That is simply used as a guide in asking questions, as the Senator will find if he reads the record. I do not know whether he does so or not.

Senator PITTMAN. I hear enough without reading any more of it.

The CHAIRMAN. Then you have no recollection, Admiral, of any such letter to the Speaker of the House?

Admiral BENSON. No particular letter. A number of letters were written, and I can not recall any particular one.

The CHAIRMAN. Did the Secretary at any time delay action or refuse to take action on matters that you considered essential for preparing for war?

Admiral BENSON. I do not believe so, sir.

The CHAIRMAN. Do you know anything about the difficulties with the 14-inch shell?

Admiral BENSON. I do not recall in detail. There was some delay. I think it was finally approved.

The CHAIRMAN. That is what I asked you, if there was delay.

Admiral BENSON. As I said just now, he did delay, in a way, to go into the subject thoroughly. I understood you to mean a determined delay or refusal, in that sense, of trying to retard the accomplishment of a desirable end. That is what I thought you meant, Mr. Chairman, when I said he did not.

The CHAIRMAN. Then there was a considerable delay in regard to the 14-inch shell?

Admiral BENSON. I think there was, and it was in order to thoroughly investigate the question. As I remember it involved some contracts abroad and also in regard to price, but I am now simply speaking from memory and giving the impression that I have, and not otherwise.

The CHAIRMAN. And you do admit that there was a considerable delay?

Admiral BENSON. I think there was. I appreciate the fact that I am under oath, sir, and I want to be as particular as I can that I do not make a statement that is too positive, and my memory is not too clear.

The CHAIRMAN. In your long association with the Secretary of the Navy did you ever see him when he could not grasp the idea of war or understand the responsibility or the duty of the Secretary of the Navy in preparing for war?

Admiral BENSON. Is it necessary for me to answer that question, Mr. Chairman? It seems to me that is a criticism of the character, and of the head of the service, and of a member of the Cabinet, of a kind that, as a naval officer, it is hardly proper to express my views on.

The CHAIRMAN. Of course the committee has a right to require you to answer any questions, but we do not insist on it.

Admiral BENSON. If you require me to answer it, I will have to answer it, but I would beg to be excused from doing so.

The CHAIRMAN. I will not. Could the Secretary at any time have given you more assistance and support in carrying out the plans of your office for war?

Admiral BENSON. I think if he had felt differently he could; that is, before the war particularly. I think the Secretary entered as whole-heartedly and as conscientiously and energetically into everything connected with the war, after it was declared, as could possibly be desired.

The CHAIRMAN. Is it not your opinion that the Secretary could and should have presented to Congress the condition of the Navy in the years just before we entered the war, in a different way from the way he did present it, in order that Congress might be more fully and correctly informed as to the conditions in the Navy?

Admiral BENSON. My opinion is, Mr. Chairman, that he did remarkably well, very much better than had been done in the previous years; and he kept in close touch with the naval committees of the House and the Senate, and while he did not always ask what was recommended by the General Board and by others, I think he usually recommended and secured everything that he could possibly have secured from the Congress.

The CHAIRMAN. Then you do not feel that he could have presented it more fully to the Congress?

Admiral BENSON. He could have presented it more fully; yes, sir.

The CHAIRMAN. Do you not feel that he should have presented the question of personnel more fully?

Admiral BENSON. Yes; I think the question of personnel should have been. I think he could have. And as I said just now, I think it should have been done.

The CHAIRMAN. Then, on the whole, you think he could have kept Congress more correctly informed of conditions than he did?

Admiral BENSON. Well, that is a question that is a little hard to answer—just what could have been done and so on. As I said, if he had wanted to, if it had been consistent with his views, and policies, he could have.

The CHAIRMAN. He could have recommended a great deal more, and that there could be no question about? Certainly he could have made fuller recommendations about personnel?

Admiral BENSON. Certainly; there is no question about that. Any one can make more than they do.

The CHAIRMAN. But do you not think he should have made more?

Admiral BENSON. I think he should have made more in regard to personnel, Senator; yes. I do not believe I could conscientiously say that he should have made fuller recommendations in regard to material. There may have been some questions in regard to bases or things of that kind, that I think ought to have been urged more strongly—storehouses and matters of that kind; but as I say, he was in close touch with the committees of Congress, and was following a definite policy.

The CHAIRMAN. Now, Admiral, what was the general policy governing the Navy Department in regard to participation in the war at the time of our entry into the war?

Admiral BENSON. It was to do everything we possibly could to assist the Allies.

The CHAIRMAN. That is, to cooperate with the Allies?

Admiral BENSON. To cooperate with the Allies to the fullest that our facilities would permit.

The CHAIRMAN. There were no plans, you say, in existence, other than ordinary prewar mobilization plans?

Admiral BENSON. None other than what I have stated, sir.

The CHAIRMAN. And after the war had started and we were to cooperate with the Allies, what was the machinery by which plans of cooperation could be carried out?

Admiral BENSON. I do not exactly understand the Chairman's question, as the question of plans has been frequently referred to.

The CHAIRMAN. I am referring to plans for cooperation with the Allies after war had been started. Through what organization, through what machinery in the department, were these plans for cooperation drawn up?

Admiral BENSON. You mean definite plans written down on paper?

The CHAIRMAN. Definite plans for cooperation with the Allies.

Admiral BENSON. As I understand it, you want to know just who drew up definite plans and put them on paper, covering all the different details.

The CHAIRMAN. Yes; for cooperation with the Allies.

Admiral BENSON. In my office, the Office of Operations, the policies and general way—call it a plan or what you may—that was drawn up in my office, and the information given out to the people concerned,

for their execution. If you remember, we sent Admiral Sims abroad to get information as to how best to cooperate in case we went into war, and to get the idea of the actual conditions; and in addition to that there was a mission that came here, sent by the British Government, in the early part of April.

Then later on, when Mr. Balfour came and the British and French sent their missions over here with their naval and military representatives.

They had their naval attachés here. We gave the attachés of the Allies offices in the department, gave them free access to all, and had daily conferences with them, and we were seeking information from every possible source. We had our attachés abroad in addition to Admiral Sims in London, and our actions and operations were governed by the situation as it developed from day to day, with the determined and most earnest effort on the part of everybody to cooperate to the very fullest with the Allies in the prosecution of the war.

The CHAIRMAN. Did the planning section have anything to do with the plans for cooperation?

Admiral BENSON. As I stated yesterday, Mr. Chairman, there was no regular planning section in the Office of Operations until very much later. We had one or two officers there to try and gradually build up a planning section. We were so short of officers that it was almost impossible to organize a planning section. We were so very hard up for officers and the demand for them in other places was so great that, as I stated yesterday, I did not carry out the law of Congress in regard to my office. I did not feel that I could, because the situation was so urgent and so necessary in every direction that I did what I thought was best for the situation as it developed.

The members of the Senate and House Naval Committees knew the conditions, and that I was not carrying out the law of Congress fully in that respect, but that I was building up an organization as rapidly as possible, and as rapidly as I could get officers to take the various duties. I tried to replace the regular officers with reserve officers as fast as I could, so that every regular officer could be detailed for active duty with the fleet or in training reserves or in other places. I feel, Mr. Chairman, that a great deal of emphasis has been laid on the question of plans simply because the situation as it existed and as it was developed and carried out is not understood, and that this question of plans which, to the ordinary mind, is rather more or less indefinite, has been unduly emphasized by Admiral Sims in his letter.

The CHAIRMAN. There was an emergency appropriation made immediately, or shortly, prior to our entrance into the war, was there not?

Admiral BENSON. In February, I think, sir.

The CHAIRMAN. Did you give any instructions in March, 1917, for the preparation of a plan for the utilization of this emergency appropriation?

Admiral BENSON. I can not recall whether I did or not.

The CHAIRMAN. You do not know whether you did?

Admiral BENSON. I do not, sir.

The CHAIRMAN. If you did give any such instructions, are they not available in the department?

Admiral BENSON. I do not think I gave any written instructions.

The CHAIRMAN. And you do not recall giving any instructions?

Admiral BENSON. I do not, sir.

The CHAIRMAN. Was not something done about utilizing this emergency appropriation?

Admiral BENSON. The question was always under discussion, and we were carrying out the policies and ideas—call it plans or whatever you may. But as I understand a plan and its use, I can not recall definitely. We had, as I said before, memoranda. We had frequent conferences and discussions, and my assistants were constantly submitting recommendations—I suppose would cover your idea of a plan to mean—and all that. But to say that just at any definite time I gave any order for a definite plan or anything of that kind, I simply can not recall it. I do know that everything was moving along uniformly, and that when the war broke we were prepared to carry out the part we could fully with all we had, and did carry it out.

The CHAIRMAN. I assume that when this appropriation was made and you were informed that it was made, you laid out some plan, did you not, on which to expend it?

Admiral BENSON. Yes; we had very definite policies; but whether we just simply drew up a plan, as I understand, Mr. Chairman, I can not say just now whether it was all written out and spread out where everyone could see. We did know what we were going to do and how to do it, and everyone concerned with the policy was properly informed.

The CHAIRMAN. Do you recall what arrangements you made for utilizing this emergency appropriation?

Admiral BENSON. No, I can not.

The CHAIRMAN. Have you any way of getting the information so that you could give it to us?

Admiral BENSON. I do not think I could, sir. I do not think I could.

The CHAIRMAN. Did you give any instructions before or immediately after our entry into the war for the preparation of plans for antisubmarine warfare?

Admiral BENSON. I think we had a very definite plan as to what would be done at all of our ports. For instance, as I stated yesterday with regard to defensive areas, and how we would station our different guns, where we would place nets, and everything of that kind; all of those details were carefully attended to, Mr. Chairman, and carried out.

The CHAIRMAN. Did you give instructions to anyone to prepare such plans?

Admiral BENSON. I do not know as I gave instructions to prepare such plans; but I gave instructions as to what to do, and those who were intrusted with the execution of those policies, I take it, prepared plans.

The CHAIRMAN. But you say you gave instructions what to do. Did you not have to have some plan before you did that?

Admiral BENSON. I left that to my subordinates, sir.

The CHAIRMAN. You left it to them to do or not to do. Did you not draw up some plans for taking care of that matter? It was certainly a very critical matter.

Admiral BENSON. As I say, as I understand plans, I can not tell you whether I gave them definite instructions or not. I kept them informed as to what my policies were, and left them to carry out the details of it. But to say that I directed them positively to definitely prepare plans, I can not possibly say.

The CHAIRMAN. Then was it purely a haphazard proposition on your part?

Admiral BENSON. No, it was not.

The CHAIRMAN. Was it not your duty as Chief of Operations to tell them to draw up some plans?

Admiral BENSON. It was my duty to handle the situation and to see that it was properly handled, and that the proper steps were taken to meet the situation, which I did.

The CHAIRMAN. Would not that involve a direction to them to draw up plans for meeting the submarine situation?

Admiral BENSON. Certainly it would, and I believe plans were drawn up to deal with it; but to tell you that I gave the direct order to do it, I can not.

The CHAIRMAN. If you did give such a direct order, would it not be in the records of the department?

Admiral BENSON. Not necessarily. I might have given a verbal order to Admiral McKean or to Capt. Pratt.

The CHAIRMAN. You do not remember whether you gave such an order?

Admiral BENSON. I do not.

The CHAIRMAN. Written or verbal?

Admiral BENSON. I do not. I do know the situation was properly and efficiently handled.

The CHAIRMAN. Were such plans prepared?

Admiral BENSON. I can not recall whether they were or not. I could not state that, whether they were in the form that I understand you want plans.

The CHAIRMAN. I would like to know whether there was any tangible, definite plan?

Admiral BENSON. All that I can tell you is that we had very definite policies. We knew what we had to accomplish. The instructions were given to the subordinates as to what we were going to accomplish, and how we were going to handle all the forces and all the facilities we had, and they were properly and efficiently carried out, and the purpose for which they were prepared was accomplished, and that was my duty; but as to going into the details—

The CHAIRMAN. But it is not giving the committee any information to state that it was properly and efficiently carried out. We want to know how it was properly and efficiently carried out.

Admiral BENSON. All I can say is to refer you to the results.

The CHAIRMAN. I do not think that always shows.

Admiral BENSON. That is the limit to which I can go.

The CHAIRMAN. Do you not think that the committee are entitled to information as to how it was done?

Admiral BENSON. That is all I have.

The CHAIRMAN. As Chief of the Bureau of Operations you must have all the records available, have you not?

Admiral BENSON. They are in the department, or should be.

The CHAIRMAN. Can you give the committee the plan, if any such there was?

Admiral BENSON. I will ask Capt. Pratt, if I may, because he was really in charge of that particular thing. May I ask to refer the matter to Capt. Pratt, because he was the one?

The CHAIRMAN. I will ask you to submit the plan to the committee if you can find it, and if not please inform the committee of that fact.

Admiral BENSON. I would like to say that I think all the necessary steps were taken. Whether plans were prepared or not, that I can not state definitely, under oath, that I gave any definite instruction in a definite way at a definite time, at this length of time. It would be impossible.

The CHAIRMAN. What definite plans were ever drawn up?

Admiral BENSON. I can not give you that information. I can not tell you that now. I assume that there were. I know that all that was necessary was done, and that is all I do know.

The CHAIRMAN. You do not know if such plans were drawn up whether they were ever put into execution or not?

Admiral BENSON. The purposes that any plan would have accomplished, were accomplished. I assume that as they went out, as the policies went out to my subordinates, what we had of a planning section drew up the necessary plans or memoranda or instructions, or whatever you wish to call them. I do know that the object for which we were struggling, was accomplished.

The CHAIRMAN. But without any initiative on your part or any information about whether it was accomplished?

Admiral BENSON. Mr. Chairman, all the policies of the operations were directed and initiated practically by me.

The CHAIRMAN. I am asking you how they were directed and initiated, and you do not give me any information about it.

Admiral BENSON. By instructions to my assistants and subordinates; and I can not give it in any further detail. I am sorry that I can not, but my memory is such, and the task that I had to perform was such, that I can not go into detail and give you these exact facts, under oath, and I have gone as far as I feel that I can.

The CHAIRMAN. What agreement did you reach with the British and French commanders in the western Atlantic during the early days of April, 1917?

Admiral BENSON. That we would be responsible for an area, I think it was from 50 degrees west longitude, covering the North Atlantic, taking in the Virgin Islands, and going then westward into the Caribbean, and then down to the north boundary of Columbia, including the Gulf of Mexico, of course; and then that we would hold cruisers in readiness to pursue raiders; in case one appeared in the North Atlantic, particularly in that area; that we would look out for an area on the east coast of Brazil, extending from 5 degrees south latitude and off the coast some distance—I have forgotten how far—and extending down parallel with the coast as far as the latitude of the mouth of the Rio de la Plata. And I also, as I recall it, agreed to send some submarines or vessels to Halifax in case they were needed. We agreed to send some small craft to the west coast of France, and also to send two colliers, I think it was, loaded with wheat and other material for the French government; and as I recall it, we agreed to let both governments have certain guns. The French, I think, we gave 100 6-pounders, or guns of small caliber, for their fishing fleet.

As I say, they requested two destroyers to be sent over, and we sent six, which left, I think, on the 24th of April, and got over there on the 4th of May. Whether we had any understanding about the conditions in the Pacific, I think there was some understanding, whether it is in the written memoranda or not I can not recall, as to the helping out in the Pacific. As you know, the British had a force—an antiraiding force, you might call it—operating on the west coast of South America particularly.

The CHAIRMAN. Did you comply with all the requests of these admirals?

Admiral BENSON. I think so; we did eventually. There was some delay in getting the small craft over to the French coast, and I do not think the submarines were sent to Halifax until some time later. In fact, I can not recall all the details about the submarines, because the understanding was that they would always be kept there in case of need, as I now recall it.

The CHAIRMAN. Did they take up the question of fighting the submarine menace?

Admiral BENSON. I do not think so, as I remember. I do not think that phase of it was brought up.

The CHAIRMAN. Admiral Mayo stated that they did.

Admiral BENSON. Well, maybe they did. I am simply giving you the best of my memory, sir.

The CHAIRMAN. You do not recall that from this meeting anything in particular was done about the submarine menace?

Admiral BENSON. We were doing everything we could to get small craft ready for them, and we were at that time practically using all of the small craft that were available to guard our own coast.

The CHAIRMAN. I say that from what happened at this meeting you do not feel that they made any particular recommendations about the submarine menace?

Admiral BENSON. The French were very urgent in their recommendations about our helping them out over there; and whether the question was broached as to whether we would later on send more destroyers or not, I mean whether they asked it or not, I do not know; but I do know that the decision was arrived at that we would send over destroyers as fast as they were ready to go over, which we did.

The CHAIRMAN. But you do not recall that any special stress was laid on the critical submarine situation that existed at the time?

Admiral BENSON. I think it was discussed, as to just what further action we were requested to take. I can not answer that, no. That was always uppermost, and I can not recall just when and where it was discussed. That was always uppermost, and was always being discussed by everybody.

The CHAIRMAN. Was it your impression that these allied admirals were prepared for the full measure of cooperation that the United States was prepared to give in fighting the submarines?

Admiral BENSON. I think so; but those things seemed to be most urgent then, as far as they were concerned, and the full and final policy of cooperation had not been decided on. We were approaching the subject as rapidly as we could, and that was one of the steps in the development.

The CHAIRMAN. Was Admiral Sims notified of the results of this conference?

Admiral BENSON. I think he was. I know that Admiral Browning sent a cablegram to the British Admiralty, and whether we sent one or not I would be unable to recall now, but Admiral Sims must have known of it.

The CHAIRMAN. But you do not recall giving him special information about it yourself?

Admiral BENSON. That I do not know. I can not recall those details.

The CHAIRMAN. Was he given any specific information about the department's plans during the first three or four months of the war?

Admiral BENSON. I think all those records have been submitted, Mr. Chairman, and I will simply have to go over the records to refresh my memory.

I feel this, that Admiral Sims was given all the information that it was necessary for him to have to properly perform his duties. He was sent over there to obtain information and to keep the department informed as far as he could, and naturally we would expect him to make such recommendations. Whether he was directly instructed to make recommendations, I could not say, because if Admiral Sims had any written instructions I never saw them. As I said earlier in this hearing, Admiral Sims was sent over more by the Secretary and not by me.

The CHAIRMAN. But in order to keep fully in touch with the situation, he should have been informed, should he not, of all the department's plans and policies?

Admiral BENSON. I think he got all the information he needed for the purpose for which he was sent over there.

The CHAIRMAN. But you do not know what information he got?

Admiral BENSON. Of course I could not tell just what information; but he was kept sufficiently informed; that is all I could say.

The CHAIRMAN. Did you give any general orders that he should be informed of every policy and plan that the department put out?

Admiral BENSON. No, sir; I do not think I ever did. What I said was this: Officers' messages were brought to me every morning, and it is possible I might have said, "Well, now, be careful that Admiral Sims is kept informed of whatever we do here as far as possible." It is very probable that I did. In the discharge of my duty I very probably did.

The CHAIRMAN. But you do not recall giving any such specific instructions?

Admiral BENSON. No, sir; I do not recall those things, Mr. Chairman.

The CHAIRMAN. Do you think he should have been kept in touch with the situation?

Admiral BENSON. Not any further than he was.

The CHAIRMAN. But you do not know just how far he was.

Admiral BENSON. He was sufficiently kept informed to satisfy the situation. I was the Chief of Naval Operations, and was responsible.

The CHAIRMAN. That is, in your opinion he was sufficiently informed, but just how much he was informed you do not know?

Admiral BENSON. Yes; but I was responsible for Operations and what was going on, and in my opinion as the responsible officer, with the responsibility which I had, I maintain that in my opinion he was sufficiently informed. It satisfied my requirements, and I think that was all that was necessary.

The CHAIRMAN. But how much that was you do not know?

Admiral BENSON. Just to what extent it was, I do not know. The details of it I can not say.

The CHAIRMAN. Simply, you felt that what you did was satisfactory?

Admiral BENSON. I feel perfectly satisfied of it; yes, sir; and I was the responsible party for it, and I assume and take all that responsibility.

The CHAIRMAN. A short time back you referred to plans for attacking enemy submarine bases. Does that refer to blockading the enemy's bases?

Admiral BENSON. I did not hear that last word.

The CHAIRMAN. Did that refer to blockading enemy bases?

Admiral BENSON. No; I referred more particularly to attacking them and trying to rake them out.

The CHAIRMAN. There was a department scheme, was there not, to blockade them by sending certain old battleships over and sinking them?

Admiral BENSON. That plan was submitted, I think, by Admiral Mayo when he went over. That was given up.

The CHAIRMAN. That was afterwards given up, was it not?

Admiral BENSON. Yes.

The CHAIRMAN. What was the general attitude of the department toward the recommendations made by Admiral Sims?

Admiral BENSON. To comply with them in as far as, in our judgment, they would accomplish the purpose we wanted to accomplish, consistent with the general plan or policy of aiding the Allies. He was given every possible assistance consistent with that policy.

The CHAIRMAN. Did he have the entire confidence of the department?

Admiral BENSON. He did. You said, "Did he have the entire confidence," did you not?

The CHAIRMAN. Yes.

Admiral BENSON. Yes.

The CHAIRMAN. Then why were the recommendations he made after conferring with the authorities on the other side not immediately adopted?

Admiral BENSON. Simply because the department did not consider that it was advisable and best to do it. Admiral Sims was not responsible for these things. He was only over there to get information and to give us the situation. He was not responsible for the final outcome of the situation, and we had a thousand and one problems here at home that we had to solve, and the whole field had to be gone over, and all the various elements had to be weighed, and the final conclusion arrived at; and in the final wind-up, the best distribution of material and personnel and everything else should be in accordance with that policy.

The CHAIRMAN. Were the home problems as important as the problems in the field?

Admiral BENSON. Whether they were as important or not, they had a decided bearing not only upon the home problems, but the home problems had a very direct bearing on the problems in the field.

The CHAIRMAN. Did you have any other information than that which you obtained from Admiral Sims about problems in the field?

Admiral BENSON. We got practically all of our information, except what may have come through the embassies and in different other ways; because Admiral Sims was in a position—well, we probably got some through attachés. When I went over in 1917, I put all of the attachés practically under Admiral Sims so that all information went through his office after that time.

The CHAIRMAN. Prior to that time was not the principal information you got about matters in the field gotten from Admiral Sims?

Admiral BENSON. That was our principal source, although we got some from the French and some also from the Italians. They had attachés in Washington, and we got some from them.

The CHAIRMAN. But the admiral was the principal source from which you derived your information, was he not?

Admiral BENSON. Oh, yes.

The CHAIRMAN. And he had your full confidence?

Admiral BENSON. Yes.

The CHAIRMAN. And in spite of that, some of his recommendations were not immediately followed?

Admiral BENSON. No; decidedly not.

The CHAIRMAN. They were, however, in almost all instances followed at a later period, were they not?

Admiral BENSON. I do not think all of them were.

The CHAIRMAN. The ones, at least, to which he has referred in his letter of January 7, 1920, were followed at a later period, were they not?

Admiral BENSON. Take the question of personnel; that was followed later on, because, as time went on and we got in trained reserves, for instance, we were able to give him more, but for the time being he did not get more because, in my opinion, I did not think that the distribution of officers could be very well changed then from what it was. Those things came to me, and I weighed the situation carefully, and I felt that the distribution of personnel that was made was for the purpose, for the cause that we had. The duties that were expected of Admiral Sims could relatively be performed with what personnel he had just as we were performing our duties here in Washington and elsewhere, in the battleships, and everywhere else, with reduced personnel. That was my opinion. That was my decision, and that was the action that was taken, and I am responsible for it.

The CHAIRMAN. You do not think that the admiral was furnished with sufficient assistance over there at the beginning?

Admiral BENSON. He was not supplied with all the assistance that it would have been desirable for him to have had, had we had a full complement of officers, and complete personnel. Under the circumstances I think he had all that we could give him.

The CHAIRMAN. Do you think that one assistant at the start was sufficient for him?

Admiral BENSON. As I say, I think under the circumstances, and for the purpose for which he was sent over there. Admiral Sims was

not sent over there to command a big force, or anything of the kind. He was sent over there to get information, and he being a flag officer, an aid was sent along with him, which is ordinarily the case. He had an attaché over there with the regularly organized force and office, and for the purposes for which he was sent over there I did consider that, for the time being, he had ample facilities.

The CHAIRMAN. In spite of his cables and letters of protest saying that he did not have sufficient?

Admiral BENSON. Absolutely. I do not admit that Admiral Sims had any right to insist on the department varying from its policies and decisions. All he had to do was to give us the information, and it was the department's function, which it exercised, to use that information to the best advantage, and that we did.

The CHAIRMAN. Even if thereby you could get fuller information?

Admiral BENSON. That was for the department to decide, and the department did so decide. Not that it might not have been well for him to have had it; but on the basis of the force we had, it was the best thing to do.

The CHAIRMAN. Which depended largely on this information which Admiral Sims was to secure and did secure?

Admiral BENSON. As I say, I think we met the situation as best we could. That covers as far as I understand.

The CHAIRMAN. You do not feel that one or two or three more officers could have been sent over to him immediately when he made the request for them?

Admiral BENSON. They might have been; but as a rule Admiral Sims nearly always asked for particular officers. He was more insistent on the particular officers, as I recall it, than he was on some additional assistance. Capt. Pratt was one of the officers he wanted. He was in my office. I was already terribly handicapped with the problems I had to solve, and to control the whole situation, and I did not let him go.

There were other officers Admiral Sims always wanted; and he always named the officer. He did not leave it to me or the Bureau of Navigation to send him such assistance as might possibly have been given him.

And later on, I decided to send him other officers that he did not ask for, which I understand did not meet with Admiral Sims's approval; but as the responsible officer, I summed up the situation and took the action that I did, to best meet it.

The CHAIRMAN. But of course, if he could not have Capt. Pratt Admiral Sims would not have liked to have some one to take the place of Capt. Pratt?

Admiral BENSON. Just as fast as the situation would permit it.

The CHAIRMAN. And it would have been a good thing if you could have sent them over earlier?

Admiral BENSON. To a certain number; not too many. I would not have always sent as many as he asked for, Mr. Chairman.

The CHAIRMAN. Well, when he had one and asked to have one more, you would have sent that, would you not, if you could?

Admiral BENSON. I shall never forget the impression made on my mind when I went in his office in London, compared with my situation at home.

The CHAIRMAN. That was when?

Admiral BENSON. In 1917.

The CHAIRMAN. What date?

Admiral BENSON. In November, I think, sir.

The CHAIRMAN. Showing that the department——

Admiral BENSON. I think that for the situation at that time, he was very well supplied. That was my impression.

The CHAIRMAN. Showing that by that time the department had realized that he needed more men, and sent them over?

Admiral BENSON. The department at all times had a realization of the situation, and did everything they could to meet it. I can not admit, Mr. Chairman, that Admiral Sims had any just cause for criticism of the Navy Department. Had he been familiar with the situation——

The CHAIRMAN. You can not admit——

Senator PITTMAN. Please, Mr. Chairman, let the witness finish his answer.

The CHAIRMAN. I think the witness has finished his answer.

Senator PITTMAN. No; he was in the midst of a sentence there when you interrupted him.

The CHAIRMAN. I will be very glad to have him finish.

Senator PITTMAN. As one member of the committee I am more interested in the admiral's testimony than I am in the other admiral's questions.

The CHAIRMAN. I think if you will listen to the questions and the answers, you will find that they will bring out some valuable testimony.

Senator PITTMAN. I am sitting here listening, and several times the Admiral has been interrupted right in the middle of a sentence. I think the record will disclose that.

The CHAIRMAN. Admiral, Senator Pittman wants you to finish this statement that you were making. I had no idea that you had not finished it.

Admiral BENSON. I say that I can not admit and do not admit that Admiral Sims had any just cause——

The CHAIRMAN. You have already said that.

Admiral BENSON (continuing). For criticism of the Navy Department for not sending him the proper personnel over there, and I question in my own mind whether he would have done it had he been fully acquainted with the actual situation that existed.

The CHAIRMAN. Whether he would have asked for men enough to carry out the work which he had to carry out?

Admiral BENSON. He would have appreciated the situation, I think, and not have been so insistent.

The CHAIRMAN. And would have given you less information on that account?

Admiral BENSON. I think he gave us all the information that we needed.

The CHAIRMAN. But his letters repeatedly referred to the fact that he was short-handed, and could not get what he wanted.

Admiral BENSON. Exactly so; but I think with what he had, he gave us all the information we really could have wanted. For instance, we never got a plan from over there; they never submitted a definite plan of action in any way to us, until we got our planning section over there, which I arranged for when I was over there, with

the British Admiralty. The question of an inter-allied naval council was initiated by me, and it was practically under my advice, and all, that that was formed. Admiral Sims came to me. I think I asked him if he attended the daily meetings of the British Admiralty, and he said no, but he would like very much to. I arranged all those details for him. I could have arranged for Admiral Sims to have had an office; as Admiral Jellicoe said he would build additional offices to the Admiralty to get them closer together; and a lot of things were of that character. I think we got all the information we really needed or could properly use; and as I said, I was the responsible officer, and I sized up the situation and made my decisions, and I hope that if Admiral Sims had known and appreciated the situation on this side, a great deal of this that he has complained of would not have been done.

The CHAIRMAN. Do you feel that Admiral Sims's recommendation about the battleships was acted on at once?

Admiral BENSON. No, it was not. That was another case in which I had the responsibility, and I assumed it, and I acted on my own judgment in that matter, and I felt that the responsibility resting on me for our own national defense was first. That was my duty, to safeguard America's interests. That was my first duty, regardless of any other duty, of humanity or anything else, and that was always the underlying motive in all the actions that I took.

Another thing, we needed the battleships on this side for training purposes, and to put the armed guards on board merchant ships, and for the general expansion of the Navy, in addition to the strategic, and future reserves that I have already referred to; and I felt that we could aid the Allies, aid the general cause better, and at the same time safeguard America's interests, by the course that I pursued; and I can only refer to the results as to whether my judgment was right or not.

It has been referred to and taken as a matter of fact, that when I went over there I realized the necessity for sending them over, and immediately did it, implying that my judgment had been wrong in the beginning. That is not the case. In my position it was necessary for me to view the whole world situation, not only what was going on at the time, but what might take place after the war was over, and I had in view the possibilities that might come after the war, the conditions that our Navy might be left in, etc.; and I did not feel that I would be warranted in leaving our Navy in such position that it could not look out for America's interests, unless the situation over there was very desperate.

Another thing, I always had this thing in mind. We were gradually getting our troops in France, and if a forced peace had been brought on, or if a complete defeat of the Allies had been accomplished, and our troops had been left in France and we had not sufficient naval force to protect their return to America, that would be unpardonable in me as the responsible naval authority, to allow such a condition to arise.

That has another very important bearing on this question, and it was only when I went to London and had close and intimate conferences with the British Admiralty, in which I advanced my views and my reasons, and with which they as I recall it were heartily in sympathy, and all, that I agreed to let them come over. And it was

for that reason, determinedly, that I did not send them over in the beginning. To begin with, I said that I would not under any circumstances send them until I got a statement from them that they thought it was necessary, and it was with that idea. That covers the whole situation of the battleships.

The CHAIRMAN. But had not Admiral Sims been having these same questions under discussion in conversations with the British Admiralty, and did he not have the same information that you got?

Admiral BENSON. He may have had the same information——

The CHAIRMAN. Wait a minute, Admiral, until I finish my question, please.

Admiral BENSON. I beg your pardon.

The CHAIRMAN. And did he not convey the results of his finding to the department before you came over?

Admiral BENSON. I do not think he was very urgent in regard to the battleships, as I recall.

The CHAIRMAN. But he had already recommended sending them over?

Admiral BENSON. He had said that they would like to have them. One reason was, they wanted to put certain of their ships out of commission, as they were short of men and officers; and for other reasons. That, I think, was one of the principal reasons.

The CHAIRMAN. And you give as one of your principal reasons for not sending them over earlier, that you wanted to have them on this side to protect our troops and bring them back after the war?

Admiral BENSON. I simply tried to cover the whole field, Mr. Chairman, as to why I came to that conclusion.

The CHAIRMAN. Was not that a little premature?

Admiral BENSON. I do not think so.

The CHAIRMAN. Just what did it refer to? It referred to bringing them over after the war, after Germany had whipped the Allies?

Admiral BENSON. Suppose that a forced peace had been made, forced on the Allies, and we had not taken part in it; or suppose that they had been defeated, and the British fleet had been defeated, with our troops in France, what would have been the result?

The CHAIRMAN. How would a forced peace have been brought about?

Admiral BENSON. That I do not know.

The CHAIRMAN. By the defeat of the Allies?

Admiral BENSON. I do not know. Suppose the British fleet had been defeated?

The CHAIRMAN. I do not think there was very much chance of that, was there, after we entered the war?

Admiral BENSON. There was in my mind a possibility of it; and it was that possibility that I had to face. I was the responsible party, and I appreciated the responsibility very clearly.

The CHAIRMAN. But it was not enough, in your mind, to justify you in sending additional ships over so that the Allies should not be defeated, was it?

Admiral BENSON. Later on, when I had assurances, I was willing to do it; but not until I had personally investigated. I did not have sufficient confidence in Admiral Sims's judgment and in his decisions to warrant me in relieving myself of that grave responsibility; and in

saying that I do not mean to reflect on Admiral Sims's judgment, but I mean to say that I was the responsible head, and mine was the responsibility that I could not pass to anybody else until I had investigated and satisfied myself of it.

The CHAIRMAN. If a forced peace had come during the early months after our entry into the war, would it not probably have come rather from the success of the submarine warfare than from any other way?

Admiral BENSON. I do not think so, sir.

The CHAIRMAN. You do not think so?

Admiral BENSON. No, sir; I do not.

The CHAIRMAN. You think it would have been more likely to have come from the defeat of their fleet by the German fleet?

Admiral BENSON. It might have come from their defeat in the field.

The CHAIRMAN. And you do not think that there was much prospect of its coming from the success of the submarine?

Admiral BENSON. I do not, sir.

The CHAIRMAN. You did not regard that as a very critical matter at that time?

Admiral BENSON. I considered it as a very serious matter.

The CHAIRMAN. But not a very critical matter?

Admiral BENSON. Not very critical. You might say that it was critical, but not a very critical matter.

The CHAIRMAN. Not even after Mr. Hoover had returned to this country in April, 1917, and had given his views about it?

Admiral BENSON. I considered it a very serious question, but I did not think at any time that that was going to settle the war; that that was going to end it.

The CHAIRMAN. Do you not think if it had been successful and they had succeeded in preventing supplies from reaching England, it would have stopped the war?

Admiral BENSON. It might have in course of time; but it would have been a good long while before it did. I do not believe they ever could have done it, in my professional opinion I do not believe they ever would have been able to have forced a peace by the action of the submarine.

The CHAIRMAN. Were you not at least alarmed when you found that they were sinking 800,000 tons of shipping in April?

Admiral BENSON. I was alarmed, because the situation was a very serious one.

The CHAIRMAN. But not critical?

Admiral BENSON. I said that it was critical, but not very critical. I do not say it was very critical.

The CHAIRMAN. And that was the attitude of the department over here, was it?

Admiral BENSON. That it was a very serious, critical situation, but they did not feel that that was going to——

The CHAIRMAN. Not that it would endanger the success of the war?

Admiral BENSON. It would very seriously affect the war; but that alone would not force an end of the war. I never felt so.

The CHAIRMAN. And that was the attitude of the department, was it?

Admiral BENSON. As I represented it.

The CHAIRMAN. Was that the attitude of the Secretary?

Admiral BENSON. I do not know what the attitude of the Secretary was.

The CHAIRMAN. You do not?

Admiral BENSON. I do not.

The CHAIRMAN. I take it you were in conference with him on such matters?

Admiral BENSON. That may all be, sir; but I could not state to you what the Secretary's attitude was.

The CHAIRMAN. Mr. Hoover had given his views on his return to this country, about the criticalness of the situation, had he not?

Admiral BENSON. I believe he had. I remember being present at the Council of National Defense in which Mr. Hoover gave one hearing, but I do not recall just how much emphasis he laid on the submarine. It was more in regard to the conservation of food, as I recall it, and the composition of our flour, and the percentage of bran, and so on, as I recall his hearing.

The CHAIRMAN. I think his statement shows that he had laid the matter before the President?

Admiral BENSON. Yes.

The CHAIRMAN. And I think other officers have testified that the department was fully cognizant of Mr. Hoover's opinions?

Admiral BENSON. The department, I think, was sufficiently informed as to the seriousness of the situation; yes.

The CHAIRMAN. And Admiral Sims had fully informed you of the criticalness of the situation, had he not?

Admiral BENSON. I think he had. I think he had done everything that could possibly have been expected to try to emphasize and insist on it in every way possible. I think he fully discharged his duty in regard to that particular phase of it.

The CHAIRMAN. Do you think that all available antisubmarine craft was sent to Europe as soon as they could have been sent?

Admiral BENSON. Strictly speaking, I think they were. There were a great many that we had use for over here, but I think as fast as we could get them ready, and in my judgment they could be spared, they were sent. I do not think there is any question about that, sir.

The CHAIRMAN. But you do not feel that if all the vessels had been ready when the war broke out, that that would be the case, do you?

Admiral BENSON. We might have sent more destroyers—a few more; but I doubt if I would have sent more destroyers, because I felt very strongly the necessity of safeguarding the battleships; The battleships were brought north against my recommendation, and I felt I had to look out for them.

The CHAIRMAN. But you could have sent gunboats?

Admiral BENSON. A very few, sir.

The CHAIRMAN. Such as were asked for?

Admiral BENSON. Yes; several of the gunboats that we had, if they had been ready, could have been sent over to Gibraltar and the other places. I think I have stated that.

The CHAIRMAN. Can you tell me if these vessels were not ready, why they were not ready?

Admiral BENSON. No, sir; I could not go into that now; I do not think.

The CHAIRMAN. You could not go into it what?

Admiral BENSON. I do not think I could, sir.

The CHAIRMAN. Was it the policy of the department to send all available light craft over immediately on the outbreak of hostilities?

Admiral BENSON. All; as fast as we could spare them and get them over there. That was our policy.

The CHAIRMAN. As fast as you could spare them and get them over there?

Admiral BENSON. Yes.

The CHAIRMAN. But not to send everything that you had?

Admiral BENSON. Not everything that we had; no. For instance, take, as I said yesterday, the seagoing tugs, for one thing that a great deal has been said about. It would have absolutely crippled, as I believe, and I think the chairman will bear me out, our people here; and we could not send those seagoing tugs. It would have crippled out munition plants in New England and prevented our getting a proper supply along the coast of coal, and I would like to recall the fact that the Navy practically saved the fuel situation from Cape Hatteras to Eastport, Me., in 1918.

The CHAIRMAN. I recall that there was a coal famine at that time.

Admiral BENSON. I think those tugs and those other vessels were more needed here, and did more good for the Allies by performing the service that they did here, than by going abroad. There was great pressure brought to bear on me both to keep them and to send them abroad, and in my opinion the best thing to do was to keep them here and to do what they did; that in that way they were doing good to the cause by sending them abroad; and I did not feel that it was up to me to take Admiral Sims's advice simply because he sent it. I did not think so then, and I do not think so now.

The CHAIRMAN. Now, in regard to the convoy system; there was some delay, was there not, in fully entering into that?

Admiral BENSON. There was some delay, yes, and there was some difference of opinion. That was a very important question to decide; and I do not hesitate to state my professional opinion now that in the light of subsequent events, had all of the merchant ships been provided with guns and with armed crews—proper crews for manning those guns—whether in the long run we would not have accomplished just about as much by sending those single ships over as fast as we could, as we did by the convoy. There is a very serious question there, Mr. Chairman, and I still have some doubt in my mind about it. We did eventually do it because the weight of opinion was decidedly in favor of it, and that was possibly one reason why we delayed in it; and, as I said yesterday, one of the principal means the German submarines had of sinking ships was by the bomb instead of the torpedo.

The CHAIRMAN. And do you feel that the adoption of the convoy system was a mistake?

Admiral BENSON. No, I do not think it was a mistake; but I say it is a question in my mind still whether they—of course, the convoy as carried out was very successful, but when you are dealing with

questions of that kind, technical questions, technical men differ in their viewpoints, and are bound to.

The CHAIRMAN. Were there not a great number of vessels sunk that had armed guards on them?

Admiral BENSON. I do not think a great many of them. But I think most of those were sunk in convoy or with convoy—a great many of them, at any rate.

The CHAIRMAN. Did they not mostly go in convoy?

Admiral BENSON. Yes.

The CHAIRMAN. Of course, the armed guard was no protection from attack by the submarine torpedo, was it?

Admiral BENSON. Very little, if any. But torpedoes do not always strike, sir, and vessels going singly could have better speed and better maneuvering powers. It is a fair question for difference of opinion, Mr. Chairman, and, as I stated, I have stated mine as a professional man of forty-odd years of service.

The CHAIRMAN. Do you not feel, in view of the fact that the convoy system was adopted later on, that it would have been a good idea to have adopted it earlier than we did? Did we gain anything by putting off its adoption?

Admiral BENSON. We did not put it off very long. The delay was immaterial, practically.

The CHAIRMAN. When did we adopt it in full force?

Admiral BENSON. I think in July. I think that was about the time. I do not think it was suggested much before that. I do not think there was any material delay in adopting it.

The CHAIRMAN. I think it was suggested early in June or May, was it not?

Admiral BENSON. Well, in May; and it was adopted in July; and as vessels were regularly running, I do not think that is such a material loss, sir.

The CHAIRMAN. You feel that the recommendations to adopt it, in view of the fact that you did adopt it later on, were justified, do you not?

Admiral BENSON. Yes; I will admit that they were justified; but I do not admit that the Navy Department, or that I as the technical head of it, would have been justified in adopting that or any other recommendation of such vast importance, simply on the recommendation of Admiral Sims, or anybody else, without due consideration.

The CHAIRMAN. Were not the recommendations of Admiral Sims, in the main, adopted in the end after a certain amount of delay?

Admiral BENSON. I do not recall just how many were or how many were not. But I will repeat, Mr. Chairman, that the department would have been derelict in its duty, in my opinion, even admitting that they were all sound and right, to have adopted recommendations without due deliberation and careful consideration of all the conditions surrounding the situation.

The CHAIRMAN. Even if they were in great need of ships at a very critical time?

Admiral BENSON. Even if the recommendations were absolutely perfect, we would not have been justified in doing it.

The CHAIRMAN. Can you specify any of these recommendations that were not later adopted?

Admiral BENSON. I can not pick them out now, Mr. Chairman; no, I can not. You see, I had to deal more particularly with the principles involved and the policies. It is impossible for me to deal with the details.

The CHAIRMAN. The hour of 12 o'clock has arrived and we will adjourn until to-morrow.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Friday, May 7, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

FRIDAY, MAY 7, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met at 10 o'clock a. m., in room —, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Fall, Keyes, and Pittman.

The CHAIRMAN. Senator Pittman, I understand you have a statement to make about certain questions that were not inserted in the record of day before yesterday.

Senator PITTMAN. Yes. In the first place I notice that there are certain purported accounts of the discussion of the matter on yesterday contained in the afternoon papers and the morning papers. I will state that I gave no interview to the press on the subject at all, and whatever statement they made with regard to it came from certain members of the press who happened to be present yesterday, when we were discussing this matter. Only one of the representatives of the press has spoken to me about it—Mr. Smith—and I told him then that I did not care to discuss anything connected with this matter until this morning.

The particular item in itself has no very serious bearing on what I had in mind. The cause of the discussion, however, in my opinion, involves a very serious matter, and that is an absolute, full, and correct report of everything that transpires at this hearing. The committee agreed unanimously that there should be no changes whatever in the proceedings as actually taking place at this hearing, except by the full consent of the committee, and at various times when witnesses desired to correct their statements, either by eliminating certain things or adding thereto, the chairman and myself have in each case discussed whether or not it was simply a change in verbiage and construction or whether it might change the possible interpretation of the testimony, and wherever it might possibly change the interpretation of the testimony we have refused to agree to any such change.

There was a portion of the colloquy between the chairman of this committee and myself omitted from the printed record of the proceedings of May 5. I was not aware of that fact before or during the proceedings yesterday, or I would have called attention to it. The chairman is perfectly right in the conjecture that I do not read those hearings that I listen to.

Upon leaving the chamber yesterday, in walking along the hall, I overheard the reporter in effect state to the chairman, as I understood it, "Shall I leave out that portion of the colloquy to-day, as I

did yesterday?" I will state that that was my first intimation that there was any portion of the colloquy on the preceding day left out. I immediately turned and asked the reporter if he had left out any portion of the colloquy on the preceding day and he said yes, he had, and that that was noted in the printed record.

I stated that I thought he had no authority, as an official reporter of hearings of the United States Senate, to leave anything out of the record. He stated that in these matters he had to take his orders from the chairman, or depend upon what the chairman desired in the matter. The chairman said, "I desire everything to go in the record"; whereupon the reporter said, "Well, I asked Mr. Henretty, your secretary, about it, and he said, 'Leave out that colloquy between the chairman and yourself,' and I did so, and noted it."

That was practically all that took place, except that I protested against anything being left out of the printed record, and denied the authority of the chairman to determine what is and what is not material to the proceedings.

I simply wish to say this, in repetition of what I said yesterday in the hall, that in my opinion it is not within the authority of any member of the committee to eliminate from the printed record any of the proceedings of this committee, whether it be considered material or not. There are other reasons for it than its materiality, as far as it affects this committee, that the press comments on whatever takes place here—

Senator BALL. May I ask you one question?

Senator PITTMAN. Wait until I finish this sentence. The press comments on what takes place here, and it would seem to be unfair to those who are reporting a hearing to report something that they may consider of interest, although it might not be very material, and then subsequently find that it was not available in the printed record. Personally I do not consider that the particular incident that brought up this discussion is very material one way or the other. It is not that at all; but we have simply got to establish as a committee whether or not the full proceedings are going to be accurately and truthfully transcribed by the reporter, or whether he is going to delete certain portions of it by instruction of the chairman or the secretary of the chairman or anyone else. I do not think it should be possible to do that.

The CHAIRMAN. I would like to make a statement.

Senator PITTMAN. I am willing to answer Senator Ball's question. I simply wanted to finish my statement in that connection, that was all.

Senator BALL. I will not interrupt.

Senator PITTMAN. No; I have finished.

The CHAIRMAN. I think, Senator Pittman, that if a majority of the committee should take the view that certain matters were to be cut out of the testimony they would have the right to see that that was done. This committee, however, has not done that.

Senator PITTMAN. I deny that right. I deny that the majority of this committee has the right to cut out any of the proceedings.

The CHAIRMAN. As I say, that is a question that it is not necessary to decide. This committee has no intention of doing anything of the sort and has not done it. As far as Mr. Johnson, the shorthand reporter, is concerned, I think he is quite justified in taking orders from the chairman of the committee.

In regard to this particular matter, at the adjournment of the meeting on Tuesday, Mr. Johnson asked me whether the colloquy between Senators, which has been referred to, was to go into the record. I told him that it was to go into the record. Later on, late in the afternoon, Mr. Henretty called me up, or rather my secretary called me up—I had left the Capitol—and told me that Secretary Daniels wanted to talk to me, and for me to call him up, and at the same time Mr. Henretty, who was in the office, spoke to me about this particular matter and asked me whether the colloquy was to go in. Yesterday when I was talking with you, Senator, I did not recall this talk with Mr. Henretty, as it did not seem of any particular importance. I told him to put in your questions, but as far as the subsequent colloquy was concerned, which was between you and Senator Ball and myself, which I had understood at the time was informal, that that should be left out. It did not seem to me to be of any material importance. It had not anything to do with any testimony given by any witness. It was simply a conversation between ourselves, and as I say, it did not strike me as of any particular importance. The record shows that there was such a colloquy, and the record, of course, is open to anyone to read. If anyone had objected or should object, it was open to him to get the testimony from the shorthand reporter and have it put in the record.

As the Senator knows, we have always talked over anything, and have not made any changes without general consent, and that could have been done. It simply did not strike me as a matter of any particular consequence. I do not think any such case has occurred in the course of the hearings, and there is certainly no chance for any such thing occurring again. It was possibly a mistake on my part, but it was simply because I looked upon it as of no particular importance.

Senator PITTMAN. I have no doubt at all that the chairman considered it of no particular importance.

The CHAIRMAN. I do not think you yourself considered it of any great importance—the actual matter.

Senator PITTMAN. Only to the extent that I have stated.

The CHAIRMAN. And I think it will be well to put it in the record.

Senator PITTMAN. But there is one thing, I think we should hold to our policy of compelling the reporter, as far as he is concerned, to transcribe whatever takes place, and then if there are any matters that we want to agree on eliminating from the record, that would be a matter for the committee.

The CHAIRMAN. I am entirely willing to subscribe to that, and I think it is a very good idea to do that. I think Mr. Johnson was justified in not doing so where I had told him to leave it out, and if there is any blame, it is entirely on my shoulders and not on his in any possible way.

STATEMENT OF MR. GRIFFITH L. JOHNSON.

Mr. JOHNSON. Senator, before you pass from that, may I make a little statement? Perhaps my view of it might be considered important.

The CHAIRMAN. I do not think it is necessary, unless you would like to.

Mr. JOHNSON. I would like to. You three gentlemen were sitting there, a majority of the committee. Senator Henretty called me up, or rather my secretary called me up—I had left the Capitol—and told me that Secretary Daniels wanted to talk to me and for me to call him up, and at the same time Mr. Henretty, who was in the office, spoke to me about this particular matter and asked me whether the colloquy was to go in. Yesterday when I was talking with you, Senator, I did not recall this talk with Mr. Henretty, as it did not seem of any particular importance. I told him to put in your questions, but as far as the subsequent colloquy was concerned, which was between you and Senator Ball and myself, which I had understood at the time was informal, that that should be left out. It did not seem to me to be of any material importance. It had not anything to do with any testimony given by any witness. It was simply a conversation between ourselves, and, as I say, it did not strike me as of any particular importance. The record shows that there was such a colloquy, and the record, of course, is open to anyone to read. If anyone had objected or should object, it was open to him to get the testimony from the shorthand reporter and have it put in the record.

As the Senator knows, we have always talked over anything and have not made any changes without general consent, and that could have been done. It simply did not strike me as a matter of any particular consequence. I do not think any such case has occurred in the course of the hearings, and there is certainly no chance for any such thing occurring again. It was possibly a mistake on my part but it was simply because I looked upon it as of no

Senator BALL. Senator Pittman, do you mean that where a question is asked and the Senator who asks it realizes that it is not a proper question, that he can not then withdraw that question and have it stricken from the record?

Senator PITTMAN. That would depend entirely upon whether or not the committee would consent to that proposition.

The CHAIRMAN. I think the committee could take action on it at the time.

Senator PITTMAN. Certainly, but we did not take any action. In fact, I wrote a note and handed it across the table to Senator Ball. He wrote to ask me whether it should be stricken out, and I wrote a note and said "No; I do not like to have it stricken out after the question had been submitted and answered," and that ended it.

The CHAIRMAN. We will proceed with the hearing.

TESTIMONY OF REAR ADMIRAL WILLIAM S. BENSON—Continued.

The CHAIRMAN. Admiral, are you in accord with Admiral Sims's statement that the services of the United States Navy were of great value to the Allies in overcoming the submarine menace?

Admiral BENSON. I think they were of considerable value; yes, Mr. Chairman.

The CHAIRMAN. In what way?

Admiral BENSON. Why, by escorting our ships through the submarine zone—that was the principal way—and by our patrol along the west coast of France, and also by the force operating in the Adriatic and Mediterranean, around Gibraltar; and not only the

destroyers and chasers, but other small craft that we sent over, and later on by the submarines that we sent over. They were all of material assistance in overcoming that menace.

The CHAIRMAN. Then you feel that the services of the naval vessels which we sent abroad did assist in putting down the submarine menace.

Admiral BENSON. Very materially, if not putting it down, at least in curbing its efforts.

The CHAIRMAN. Do you feel that they in any way materially assisted in shortening the war?

Admiral BENSON. No; except in so far as they safeguarded the transport of troops and munitions and things of that character, and except in the North Sea barrage. I think that had possibly an effect on the general situation, but I do not believe anything tended to shorten the war except—that is rather putting it a little strong—what I mean to say is that I think what really affected the length of the war was the getting of American troops onto the western front, and anything that tended to assist in getting them there and keeping them supplied with the proper munitions and other necessities were the elements that really affected the final determination of the war.

The CHAIRMAN. Do you not feel that controlling the submarine menace had anything to do with making it possible for us to supply our army?

Admiral BENSON. I think I stated already that that was the work that they did, that they protected our vessels in taking over the troops and supplies, and of course that was necessary. Otherwise we would not have been able to have gotten our troops safely on the other side.

The CHAIRMAN. So it was a very material help in that respect?

Admiral BENSON. In that respect, very material.

The CHAIRMAN. And anything that we could have done to put down the submarine menace, so that we could get out troops and supplies over, would naturally tend to help shorten the war, would it not?

Admiral BENSON. So far as it would have increased the taking over of troops it would, but as a matter of fact we took over the troops without any harm to any of them. The Navy did not lose a single American soldier on their way over to France as I recall it.

The CHAIRMAN. Do you not feel that we did so, and that we took care of the supplying of those troops—

Admiral BENSON. I do.

The CHAIRMAN. Largely because we did have the submarine menace in hand?

Admiral BENSON. That is a matter of record, that we did.

The CHAIRMAN. And that we contributed largely to getting the submarine menace in hand?

Admiral BENSON. We did. In that particular respect I think we contributed very largely to it; but I would like to emphasize the fact that I think that is the only way in which we did contribute to the final ending of the war.

The CHAIRMAN. But you say they were of definite value—the vessels that we sent over?

Admiral BENSON. In that direction; yes.

The CHAIRMAN. But of what value were they if they did not help shorten the war?

Admiral BENSON. I say only in that direction.

The CHAIRMAN. But in that direction they were of definite value?

Admiral BENSON. They were of definite value, yes.

The CHAIRMAN. And the sooner we had the submarine menace under control, the sooner we could send our troops over, and the sooner we could supply them.

Admiral BENSON. No; I think we sent our troops over quite as fast as it was possible to do so, regardless of the submarine menace.

The CHAIRMAN. How about feeding them?

Admiral BENSON. We got the supplies to them also.

The CHAIRMAN. Because we had control of the submarine menace.

Admiral BENSON. In other words, I do not think that the getting of our troops onto the western front of France and keeping them supplied was in any way delayed by the submarine menace. I will put it that way.

The CHAIRMAN. And you do not think the assistance that was given in putting down the submarine menace had anything to do with getting our troops to France and keeping them supplied?

Admiral BENSON. I have said as plainly as I could, Mr. Chairman, that I thought we did very materially assist in that. We escorted our troop ships and supply ships, and got them over there, got the ships over there.

The CHAIRMAN. Did the checking of the submarine menace directly affect the getting of the troops and supplies for the troops over there?

Admiral BENSON. It was necessary in order to keep them down, and to protect the ships, and get them over there.

The CHAIRMAN. I did not quite hear that.

Admiral BENSON. I say it was quite necessary that we should protect the ships and keep the submarines down to the extent that we could get the ships over there safely, as we did.

The CHAIRMAN. And the fact that we had put down the submarine menace to a certain extent was what enabled us to do so, was it not?

Admiral BENSON. Yes; it was necessary to do that, but I do not admit that by what we did we by any means—that the end of the war would have been shortened if we had not done what we did do.

The CHAIRMAN. That is, if we had not gone in at all, or done anything to check the submarine menace?

Admiral BENSON. No, I do not say that. I do not think my words can be construed in that way.

The CHAIRMAN. I ask you the question.

Admiral BENSON. No, I do not think so.

The CHAIRMAN. I do not quite understand your point. You do think, do you, that if we had not gone in and done what we could against the submarine menace, we could not have gotten our troops over and supplied them as we did?

Admiral BENSON. I do not think we could, if we had not done what we did.

The CHAIRMAN. But if we had been able to do it at an earlier period, would not that have been of advantage?

Admiral BENSON. I do not think it would have affected getting our troops over.

The CHAIRMAN. Did we get all of our troops over ourselves?

Admiral BENSON. We did not.

The CHAIRMAN. During the first six months what proportion of our troops that were taken over to the other side did we carry over?

Admiral BENSON. That is a matter of record, I think. The table of the rates at which the troops were sent over, I think that is a matter of record.

The CHAIRMAN. Substantially what proportion of our troops during the first six months did we carry over ourselves?

Admiral BENSON. I think probably during the first six months the larger percentage were taken over by foreign ships, principally by the British.

The CHAIRMAN. The British?

Admiral BENSON. Yes.

The CHAIRMAN. During the whole war what percentage were taken over by our own people and what by the Allies?

Admiral BENSON. I think we took over about 900,000, as I remember, and altogether there were 2,300,000 taken over. That is my recollection of the figures.

The CHAIRMAN. Do you recall that Admiral Sims made recommendations about an advance headquarters of the department on the other side?

Admiral BENSON. Yes.

The CHAIRMAN. What was your attitude toward that recommendation?

Admiral BENSON. As I recall it, that we could not comply with that request. I felt and I still feel that Admiral Sims's interpretation of his mission was not in accord with the mission that the department intended him to perform or fulfill, and I think a great deal of Admiral Sims's feeling in this matter has been due to his failure to appreciate what his mission was.

Admiral Sims at first, as has been stated, was sent over to obtain information upon which the department could act. After that he was put in command of our forces over there, but at all times Admiral Sims was an assistant to the Chief of Naval Operations, with an office in London, simply coordinating and keeping a general supervision of the forces over there, seeing that the policies that the department decided on were properly executed, and as far as possible keeping in thorough touch with the whole situation in Europe and keeping the department informed in order that it might be able to formulate policies and give proper instructions; but it was never intended, nor did the situation permit, of Admiral Sims occupying any such position as he felt that he should occupy and seems to indicate in his letter to the department that he did occupy.

I feel that as Chief of Naval Operations I was responsible for the policies carried out in all parts of the world, in Europe as well as elsewhere, and I looked upon Admiral Sims simply as my representative to carry out those policies in European waters.

As is well known, our destroyers that were operating from Queens-town, while under the command and general supervision of Admiral Sims, the details were carried out by the British admiral, principally through our captain of the flagship there, Capt. Pringle, and I imagine that he, in close cooperation with Admiral Bailey, attended to those matters until the principal activity of our destroyers and small craft was shifted to Brest, on the French coast, when Admiral Wilson at

Brest, though nominally under Admiral Sims, directly carried out the management and general direction of our forces on the coast of France.

I did not get to Queenstown to go over the details, but that is my understanding of that situation, and I will say that when I was in France in 1917 I inspected the west coast of France, and not being satisfied with the conditions that I found there, and knowing that it would probably be decided to send our troops over in large numbers, prepared an organization for the west coast of France, in fact, our naval affairs generally in France, which as soon as I got back to the United States I cabled over, and it was that organization that was carried on throughout the rest of the war.

So that at all times Admiral Sims was as a rule, except from time to time when he may have visited the various stations, and went to Paris for consultation, was living in London, and the forces were being operated in the field in a manner very similar to the way in which they were being operated by my orders through others from Washington.

The CHAIRMAN. Was not Admiral Sims commander in chief of the forces on the other side?

Admiral BENSON. No, sir; he was not.

The CHAIRMAN. At any time?

Admiral BENSON. No, sir.

The CHAIRMAN. Who was?

Admiral BENSON. The commander in chief was Admiral Mayo, the commander in chief of the fleet. All of our naval forces were under Admiral Mayo, the commander in chief of the fleet, and he was acting under the Chief of Naval Operations, who was acting under the Secretary of the Navy.

The CHAIRMAN. Did he give orders direct to Admiral Sims?

Admiral BENSON. Just what orders he gave I do not know, but the situation was such that as a rule the orders were given directly from Washington to Admiral Sims by me, and as far as we could, I think we kept Admiral Mayo informed of those orders. Admiral Sims requested that he be given an independent command, and that was denied him, for the reason, which I think was explained to him, that it was intended to keep the fleet ready for fleet action, and it was therefore necessary for the commander in chief to be familiar at all times with the various elements of the fleet, their readiness for battle, and any service which they might be called on to perform.

The CHAIRMAN. Is it not true that Admiral Sims did not take his orders from Admiral Mayo?

Admiral BENSON. He would have to take any orders that Admiral Mayo gave him, sir.

The CHAIRMAN. But Admiral Mayo gave him practically no orders during the war?

Admiral BENSON. I doubt if he gave him many orders. As I say, the situation was a peculiar one, like this whole war was a peculiar one, and we had to meet the situation that confronted us.

The CHAIRMAN. I take it that Admiral Sims, if he was not commander in chief over on the other side, must have been subordinate to some one else. Now, to whom was he subordinate?

Admiral BENSON. He was subordinate to Admiral Mayo.

The CHAIRMAN. But you say that Admiral Mayo did not give him orders. He did not have to go to him for orders?

Admiral BENSON. He did not have to go to him. He had to take any orders that Admiral Mayo gave him.

The CHAIRMAN. But practically none were given?

Admiral BENSON. I do not believe very many were given, because the situation did not warrant it; but that is often the case in handling matters of this kind, as we did in many other cases during the war, where orders were sent out directly to one subordinate and then inform the immediate commander of that subordinate just what instructions were being given, so that he would be informed fully of the situation. That was done not only in the case of Admiral Sims and Admiral Mayo, but it was done with the convoying force; it was done with the forces under Admiral Caperton, and possibly with the forces under Admiral Fullam in the Pacific, and the Admiral in China, and everybody else. I did not hesitate to give orders directly to anybody, subordinate to one commander or another, where I felt it was necessary, and then inform the immediate commander of that subordinate what action had been taken.

The CHAIRMAN. If Admiral Sims was not commander in chief of the forces on the other side, what was his rank?

Admiral BENSON. His title was commander of the naval forces in European waters.

The CHAIRMAN. In what particular way was that different from being commander in chief of the naval forces on the other side?

Admiral BENSON. The commander in chief, by regulations and authority and act of Congress, and every other way, has certain functions and prerogatives that a commanding officer has not. He is practically supreme in his command except for the Navy Department; and I will say this, that in the strict sense the title of commanding officer of the naval forces in Europe in this particular case was almost a misnomer, but it was the best term that at the time seemed to fit the situation; but Admiral Sims, as a naval officer, as a technical man, should have appreciated and understood fully the situation. While it may not be possible for me to go into all the little details to explain them, he should have known, and undoubtedly did know, exactly what his position was.

The CHAIRMAN. Then he was commander of the forces?

Admiral BENSON. He was commanding the naval forces in European waters; yes.

The CHAIRMAN. And when our forces were sent over there they were placed under Admiral Sims, were they not?

Admiral BENSON. They were placed under Admiral Sims with the understanding that they would be distributed where they would do best. Later, when the battleships were sent, as I recall it was clearly understood before they left that they would be placed in the Grand Fleet and under the command of the commander in chief of the Grand Fleet.

The CHAIRMAN. But were they not also under Admiral Sims?

Admiral BENSON. There were in a supervisory way, yes, but not for active operations. They acted with the fleet, maneuvered with the fleet, and Admiral Rodman took his orders in regard to the active operations of his forces from Admiral Beattie, just as the destroyers took their orders for active operations, etc., from Queens-town, from Admiral Bayley, and in Brest Admiral Wilson managed and controlled his forces there directly, without any intermediate

foreign officer. He always kept the French Vice Admiral in command at Brest fully informed as to what he was doing, but he did not take his orders from him in any other way.

The CHAIRMAN. Was not Admiral Wilson obliged to keep in communication with Admiral Sims?

Admiral BENSON. He was and did keep in close communication with Admiral Sims, and a great deal of the information upon which he acted came from London, through the information that was gotten from the British Admiralty.

The CHAIRMAN. Was he not subordinate to Admiral Sims?

Admiral BENSON. He was.

The CHAIRMAN. When forces are sent out, ordinarily they report, do they not, to the commander in chief?

Admiral BENSON. They report to the senior naval officer in the vicinity where they arrive.

The CHAIRMAN. And from that time on they are under the commander in chief, are they not?

Admiral BENSON. Under his orders—not necessarily the commander in chief. Of course they would be under the orders of the immediate superior who was in that locality, that immediate superior being under the orders of some higher superior, finally up to the commander in chief.

The CHAIRMAN. Did Admiral Wilson, Niblack, Strauss, and Rodman report to Admiral Mayo?

Admiral BENSON. Only through Admiral Sims. That is the regular hierarchy of authority in naval and military organizations.

The CHAIRMAN. And Admiral Sims reported, did he not, direct to the department?

Admiral BENSON. He reported direct to the department. He was also directed to report to the commander in chief, Admiral Mayo, particularly with reference to the condition of his command, and it was supposed he would keep him informed of any general movements, etc., that he carried on.

The CHAIRMAN. But that was rather a small part of his duty, was it not?

Admiral BENSON. Reporting to Admiral Mayo?

The CHAIRMAN. Yes.

Admiral BENSON. Yes; that was a small part of it.

The CHAIRMAN. In most cases he reported to the department?

Admiral BENSON. In most cases he reported directly to the department and received his orders directly from the department.

The CHAIRMAN. Now, Admiral, you state that you were responsible for the policies that were carried out by the department during the war?

Admiral BENSON. Yes; that is regarding naval operations.

The CHAIRMAN. Were not those policies in regard to naval operations on the other side based largely, almost entirely, on the representations made to you by Admiral Sims?

Admiral BENSON. On the information that we got from there; yes.

The CHAIRMAN. And the recommendations?

Admiral BENSON. Yes; very largely on the recommendations.

The CHAIRMAN. How did you happen to approve of the establishment of a planning section on the other side?

Admiral BENSON. When I was in the British Admiralty I went through their whole organization, and at that time one of the admirals connected with the Admiralty—I think he was the aide to the first sea lord, Admiral Weems—was intrusted with that particular branch of the Admiralty, and in discussing the situation as to the method of planning, etc., with him it may have been that the question was brought up by Admiral Sims, or some of his office, and it was a question that was always uppermost in our minds, to complete our arrangements as far as we could, but the desire was to get in closer touch with the force on the other side and with the British Admiralty, and this question was discussed. Who initiated it or suggested it I am unable to say just now, but after going over the question I know I decided that it would be much better if we could establish a joint planning section—that is, to have two or three of our best officers, most fitted for that duty, to go to London and go right into the planning section of the British Admiralty, and I decided on that, and cabled home, mentioning by name some of the officers that were in my office here in Washington to be sent over to establish that planning section in conjunction with the one in the British Admiralty.

Just who suggested it I could not say just now, but I know that as soon as the subject occurred to me, or was presented to me, I took it up actively, just as I did the question of allowing Admiral Sims to attend the daily meetings of the lords of the Admiralty, which Admiral Sims said he would like very much to do, and I immediately took it up with Admiral Jellicoe and Sir Eric Geddes, and they not only were willing but very glad indeed to have it done. So that was established.

Then, as I said yesterday, there was the question of the interallied naval council. I feel that I initiated that and the rules by which it should be governed were settled by us in London with the understanding that as I could not be present at the meetings on account of the long distance, Admiral Sims would represent me and the Navy Department on that council when I could not be there. Whenever I could be there I was there, representing the United States Government on that council.

The CHAIRMAN. You say you initiated the idea for the interallied naval council?

Admiral BENSON. That is my recollection of it, sir.

The CHAIRMAN. Before you initiated the international allied naval council, how did they get along?

Admiral BENSON. They had conferences between them. The leading naval authorities got together. For instance, when Admiral Mayo went over, as he did in August or September, I think, 1917, there was quite a conference held there between the different allied powers; but as to the regular allied naval council, it was suggested, as I recall it now, by me along the lines of the supreme war council, which was established, I think, while we were over there, due to the debacle in Italy, and the fall of the French Government, and the situation that developed.

This supreme war council was established, and along with it it occurred to me that it would be necessary to have this interallied naval council, and it was put before the interallied conference that was held in Paris, where there were, I think, 22 different nationalities represented, and the idea was adopted and became a permanent

part of the interallied method of carrying on the war. That is my recollection of the situation.

The CHAIRMAN. And Admiral Sims was made a member of that council?

Admiral BENSON. It was understood that on account of the distance of the United States and of Japan from London and Paris and Rome that Admiral Sims, who was our senior naval representative in Europe, would represent me and the Navy Department when I could not be there, and I think the same understanding was come to as far as Japan was concerned, that their naval attaché would represent the chief of the naval staff of Japan.

The CHAIRMAN. When you were there in person did Admiral Sims attend the meetings of the council?

Admiral BENSON. As a rule he did attend, but not as the representative of the United States; simply as my aide and adviser.

The CHAIRMAN. Did he take any part in the meetings?

Admiral BENSON. Yes; he always had the privilege, and availed himself of it, of expressing his views.

The CHAIRMAN. And taking part with the others?

Admiral BENSON. Taking part and expressing his views, yes; but simply as my assistant and adviser.

The CHAIRMAN. And did matters come up occasionally in the interallied council in which you had to come to a vote?

Admiral BENSON. I think they frequently did.

The CHAIRMAN. Did they while you were there?

Admiral BENSON. Yes. The question that I remember particularly was in regard to the terms to be submitted for the armistice.

The CHAIRMAN. Did you and Admiral Sims differ in any way as to what should be done in any action that was taken?

Admiral BENSON. There were some differences of opinion in regard to the terms that should be submitted to the Germans for the armistice, as I recall it, in regard to whether the vessels should be surrendered outright or whether they should be interned. I think he differed with me on that question, and possibly a number, though that I can not recall just now.

The CHAIRMAN. In such cases, where you were present, you voted?

Admiral BENSON. I voted. I do not think Admiral Sims could have voted, as I recall the situation, because I was the representative.

The CHAIRMAN. And you do not recall any of the matters which came up in which you voted differently?

Admiral BENSON. Only just that one that I do recall now; that I differed with him on that question. The British insisted that they should be surrendered and I took a different viewpoint.

The CHAIRMAN. Do you think that the information sent to the Navy Department by Admiral Sims after he had an adequate staff on the other side was of value to the department?

Admiral BENSON. I do.

The CHAIRMAN. He was able to give more information after his staff was increased than before, I assume, was he not?

Admiral BENSON. Yes; I suppose he was. Yes; naturally, he would be able to get it more in detail, and possibly more; and then another thing, as I said yesterday, all of the attachés were ordered to send all of their information to him.

Then another thing, the organization was increasing from day to day, our forces were increasing, and the question of aircraft and the location of aircraft stations, and a place for the men to be accommodated, and all of those details, made it necessary that his staff should be materially increased. Whether it added so very much to the information we got from him along the lines on which we really needed it, except in connection with these new activities which were developing as the war progressed, I do not know that there was so very much difference.

The CHAIRMAN. Did you have available in Washington in the early months of the war such full and complete and full information regarding operations in the war zone that you could formulate operation plans in Washington?

Admiral BENSON. I think we had sufficient information to lay down our general plan of operations.

The CHAIRMAN. Specific operational plans on the other side?

Admiral BENSON. Our plan in general was to send vessels over as fast as we could, to get them ready, and so on, to act, to cooperate, with the Allies in any plans that they had. That was our general plan. We, as I recall it, never got a definite plan from Admiral Sims as to what operations the British or the Allies were acting on. That is my recollection, and I believe that is correct.

After we sent these officers over, to whom I referred, in the planning section, then we did get plans from over there of a definite character. Up to that time, as I understand it, we did not get definite plans. As I said, there was a very secret, definite confidential plan that Admiral Jellicoe showed me for operations against the submarine bases.

The CHAIRMAN. That was never put into effect?

Admiral BENSON. Only so far, I think, as Admiral Keyes carried it out later in 1918, when he attacked Zeebrugge. It was something along that line.

The CHAIRMAN. That was as to blockading German ports, was it?

Admiral BENSON. No; I think that plan, as I remember now, was for attacking certain bases.

The CHAIRMAN. But you did not have sufficient information to regulate the operational plans after the vessels had reached the other side, did you?

Admiral BENSON. I did not; because they had to cooperate with the Allies along plans which they would develop.

The CHAIRMAN. Did not the Allies have to know definitely what action we would take in regard to the recommendations made by Admiral Sims, with which, of course, they were familiar, in order successfully to make these plans?

Admiral BENSON. I do not think there was ever any question in their minds as to what we would do, sir.

The CHAIRMAN. I think Admiral Sims, for instance, on May 1, asked the department to assist in establishing a convoy system. He received no reply until June 20. Now, in between those times must there not have been considerable question in the minds of the Allies as to what our attitude was going to be in regard to the convoy system?

Admiral BENSON. I think, as I say, the Allies were kept informed of the development of any of our ideas or intentions. You will

recall that we had here, for instance, officers and attachés, and we communicated directly with those attachés and got information from them. They were receiving very full and confidential information daily, almost hourly, and those things were always communicated to us, and we communicated with them; so that a good deal of the information, while it might not have gone directly to Admiral Sims, we satisfied ourselves that the allied authorities—naval authorities—were kept sufficiently well informed in regard to the developments in the situation.

The CHAIRMAN. I assume that the allied authorities supposed that when they were dealing with Admiral Sims they were dealing with an authorized representative of the American nation, did they not?

Admiral BENSON. I think they understood perfectly well what Admiral Sims's position was, sir. I think, as I said just now, there is an exaggerated idea as to Admiral Sims's position that he occupied. I think the Allies understood that the operations in Europe were being directed from Washington.

The CHAIRMAN. Do you not think that when the Allies knew that Admiral Sims had made this request about the convoy system and this recommendation, and they knew that he did not receive any reply, as I assume they did know, for at least seven or eight weeks, they must have been somewhat in doubt as to his position over there?

Admiral BENSON. Very likely they did know all of that; but unquestionably they also must have taken into consideration that as Admiral Sims was not the responsible officer, and he did have to take his instructions from Washington, it was a logical supposition that Washington, before it adopted a policy of such tremendous import as that, would give it very careful and thoughtful consideration before they adopted it, and when they were ready to adopt it they would be informed either directly or through Admiral Sims. They are quite as familiar with the ordinary methods of developing a situation of that kind as we were, and our general methods and ideas are very similar in the British Navy and in the American Navy; so that there was not any question in their minds at any time, as I believe, in regard to what we were doing. As I say, we had this daily, constant conference with their representatives who were over here.

The CHAIRMAN. As I recall the matter, the situation on the 1st of May was somewhat critical in regard to the submarine menace, and time had a good deal to do with it. Now, you say they were familiar with what we were doing over here.

Admiral BENSON. I believe they were.

The CHAIRMAN. Did you communicate direct with the British Admiralty through other means than through Admiral Sims, about this question of convoy? If so, I would like to know where.

Admiral BENSON. I do not think we did. We undoubtedly were in daily, intimate conference with their attaché, who knew what was going on—our discussions, and so forth—and undoubtedly he did.

The CHAIRMAN. Were you in daily conference with their attaché about the convoy system?

Admiral BENSON. Not I personally, but my subordinates, I think, were; well, unless they happened to be out of Washington, or for some particular reason, they were constantly in conference with them.

The CHAIRMAN. Would it not have been a good idea to answer Admiral Sims's letter?

Admiral BENSON. It might have been.

The CHAIRMAN. At least to give him the knowledge of what was being done in this country about it; that it was being discussed.

Admiral BENSON. It might have been, and it might not have been. I would like, if I could, to say to the committee that each day every phase of the question involved was given most earnest and careful consideration by everybody, and I believe that every necessary act and step was taken in order to carry on what was best to accomplish the end in view. I unfortunately have a rather poor memory for details. I had a perfect grasp of the great field of operations and its general policies that were necessary to be adopted to accomplish what we were after, and I gave these policies out, and left it to my subordinates to execute them. I can not go any closer into it than that, sir.

The CHAIRMAN. In a letter from the Secretary of the Navy—a letter or a statement, I think it was a letter—on June 20. The Secretary stated:

In regard to convoy, I consider that merchant vessels having armed guards are safer when sailing independently.

That does not look as though they had gotten along very far in Washington about adopting the convoy plan, does it, at that time?

Admiral BENSON. Just at that time. I do not know just when we did adopt the first convoy. It is all a matter of record, sir.

The CHAIRMAN. I think it was sometime in July, was it not?

Admiral BENSON. That is my recollection, but I can not speak definitely in regard to the exact time. I do not think any of our troop ships ever left without an escort of some kind.

The CHAIRMAN. The letter to which I refer appears on page 205 of the typewritten record.

Now, in regard to submarines, Admiral Sims first asked for submarines on June 28, and again on July 13 and July 14, and he received no reply at all about this. Would it not have been better to have acquainted Admiral Sims with the policy of the department about this matter, or at least to have answered his letters?

Admiral BENSON. It might have been, sir; but as I was in charge of the whole affair, and responsible for it, I exercised my discretion and judgment in the matter. I felt that Admiral Sims was very urgent—naturally he would be, under the circumstances—and I did not consider that it was necessary to consume time, and so on, always, to answer all of his repeated requests, and so forth, and I exercised my judgment and discretion in the matter, and feel that I was justified in doing it.

The CHAIRMAN. And as regards battleships, they were recommended on July 21, and no reply was received until August 20.

Admiral BENSON. The same thing there. I stated to you yesterday my reason for acting as I did in regard to the battleships. I exercised my judgment and discretion in the matter and am responsible for what was done.

The CHAIRMAN. You mean your judgment about replying?

Admiral BENSON. That may have been a case of neglect on the part of a subordinate in the office, Mr. Chairman: It would be im-

possible for me to tell just whether it was a case where I directed them not to do it, or not; there were so many details that I can not possibly recall it, and a subordinate may have neglected, in some of these cases. But I felt that Admiral Sims was being adequately attended to as far as replies and the paper work, as you might call it, was concerned.

The CHAIRMAN. Do you not think that the failure to reply, which failure the Allies must have known about, would indicate to them a certain lack of cooperation?

Admiral BENSON. I do not, sir.

The CHAIRMAN. Why not?

Admiral BENSON. Because, as I have stated just now, they knew that all these questions had to be carefully considered, and they took it for granted that we would give careful consideration to them, and also, if there was any question about it, I feel that we were satisfied that the information that the attachés of the Allies had was sufficient for the particular cases that happened to be under consideration.

The CHAIRMAN. Now, if there was unnecessary delay in these matters, Admiral, where would the responsibility for it lie?

Admiral BENSON. Ultimately it would lie with me; or, if you want to go higher and say the Secretary of the Navy, if you want to go to the top of the list. I was the one, though, that was responsible; and certainly, if there was any fault in the matter, I am responsible for it.

The CHAIRMAN. There was no fault on the part of your aids in any way, in Operations?

Admiral BENSON. I do not believe so. I feel that I can not say too much for the energy, intelligence and loyalty displayed by every one of my assistants.

The CHAIRMAN. So that if there was any delay; it was on your part and not on the part of your subordinates?

Admiral BENSON. I am responsible for it; yes, sir.

The CHAIRMAN. Were you in any way delayed in these matters by the Secretary?

Admiral BENSON. I do not think so—the matters you have referred to this morning; absolutely, not.

The CHAIRMAN. Were you in regard to any of Admiral Sims's recommendations?

Admiral BENSON. I do not believe so.

The CHAIRMAN. So that it was altogether, if there was any delay, your fault?

Admiral BENSON. The Secretary was guided by my advice in these matters. I do not admit, though, there was any fault.

The CHAIRMAN. I asked you if there was any fault?

Admiral BENSON. Yes.

The CHAIRMAN. You know of no cases in regard to any recommendations of Admiral Sims where the Secretary delayed unnecessarily?

Admiral BENSON. I can not recall any. I do not believe there were any.

The CHAIRMAN. What did his disposition seem to be, to accede to the requests of Admiral Sims?

Admiral BENSON. As far as it was practicable and in accordance with the recommendations I made. But may I state again, Mr. Chairman, because there seems to be an impression that I was under

some compulsion to take Admiral Sims' recommendations, to do what he said, I want to make that plain, that I was under no compulsion whatever. I was the responsible party, and it was my function, given me by act of Congress, to handle this matter, and I did it; and I must feel that the impression may exist that Admiral Sims was not given proper consideration, and I want to insist that he was my subordinate, and it was my right and my duty to exercise my judgment in the way in which he was treated.

The CHAIRMAN. Does not history show, Admiral, cases where the chief of staff may have interfered with the commander in chief in the field where it has resulted disastrously? There may have been such cases where he had the right to, under the authority of law?

Admiral BENSON. There may have been such cases. I am not familiar enough now with any particular case to say yes or no.

The CHAIRMAN. Was there not such a case in the Civil War in regard to the Army of the Potomac?

Admiral BENSON. I could not say that, sir. I am not familiar enough with the history of the Civil War to state that.

The CHAIRMAN. Was there not considerable complaint about Gen. Halleck—I think it was Gen. Halleck—interfering with commanders in the field?

Admiral BENSON. Gen. Halleck was chief of staff, and there is a good deal said about Gen. Halleck in Gen. Sherman's memoirs; but just how much he interfered, now, I can not recall the details.

The CHAIRMAN. It would be possible for him to hold matters up?

Admiral BENSON. It would be very possible for him to do it.

The CHAIRMAN. You say that you had other sources of information in Washington besides what you got from Admiral Sims about naval matters on the other side?

Admiral BENSON. The attachés gave us a great deal of information. We got a great deal of information through the attachés. I do not know whether you were ever through the office up there, Mr. Chairman, but you may know, and some of the Senators do who were on the Naval Committees, that we had all of our officers, with all the information plotted every hour in the day, nearly, where the western front was, where the various ships were, where the various submarines were operating; and one could go in there at any time, day or night, and get all of the information that was at all desirable, of what was going on in any part of the world. It was there on charts, and it could be shown at a glance what the whole situation was at all times.

The CHAIRMAN. Did you carry into effect any plans that were based on information given to you through these other sources, and not through Admiral Sims, in regard to matters on the otherside?

Admiral BENSON. Any plans that were developed would have been completely taken into consideration information gotten from every possible source, whether from Admiral Sims or anyone else. We did not simply depend on Admiral Sims for all our information.

The CHAIRMAN. But did you carry into effect any plans concerning which you had not received information from Admiral Sims about matters on the other side?

Admiral BENSON. That is possible.

The CHAIRMAN. That is what?

Admiral BENSON. I say that is possible.

The CHAIRMAN. You do not recall any such instance?

Admiral BENSON. No, sir.

The CHAIRMAN. You can not definitely state that there was any?

Admiral BENSON. No, sir.

The CHAIRMAN. Did you formulate any definite operational plans on this side?

Admiral BENSON. I merely outlined general policies and left it to the subordinates to develop any plans that were necessary for carrying them into execution. How many plans were developed, and all, it would be very difficult, or practically impossible, for me to state.

The CHAIRMAN. Do you know of any operational plans that were developed on this side and carried out on the other side?

Admiral BENSON. I think I have answered that question before, sir; I can not recall in detail those plans. There must have been plans, but I can not recall them.

The CHAIRMAN. Operational plans?

Admiral BENSON. Operational plans. For instance, as I said yesterday, take the question of the districts and the distribution of the craft in the districts, the placing of nets, and what areas should be mined under certain contingencies, and things of that kind; where aircraft stations would be located, and where they were to operate. Those things were all carefully attended to. I can not state at this time whether I gave definite instructions to my subordinates to draw up a plan of that kind. I can not recall now whether that was put into definite form or not. I assume that it was, because the idea was always carried out, and I can not go any further than that into the question of plans.

The CHAIRMAN. Then you would not subscribe to the general policy of having base plans prepared on this side, and operational plans prepared and carried out at the seat of operations?

Admiral BENSON. There were certain plans that would be necessary on this side, and certain plans on the other side, and it was for that reason that we sent our planning section abroad, to keep in touch. They were getting the information very complete, and would make out plans over there, which they did and submitted to us. They went over in December, I think, 1917, and there was an order that those plans in which we participated must be approved by the Navy Department.

The CHAIRMAN. The operational plans?

Admiral BENSON. Practically all operational plans in which our forces participated, except in cases of immediate necessity or emergency.

The CHAIRMAN. Then you would not subscribe to the policy which I mentioned?

Admiral BENSON. Oh, I think in general; and immediate practical or operational plans, as you call them, would have to be developed in the field.

The CHAIRMAN. But always sent back home and approved before being carried into effect?

Admiral BENSON. Not always, Mr. Chairman, because we were operating with the Allies. We were not operating in an independent war. For instance, I do not imagine that Gen. Pershing had to send his plans back. He had an independent army over there, and was occupying a very different position from the position that Admiral Sims was occupying. There is no relevancy

The CHAIRMAN. Do you not think that in general in warfare the commander in chief or the commander of the forces in the field should be given the maximum of initiative?

Admiral BENSON. Absolutely, sir; but I do not think that that holds in the case of Admiral Sims.

The CHAIRMAN. You mean specially of Admiral Sims?

Admiral BENSON. Under the conditions. When I say Admiral Sims, I do not mean that personally; but he happened to be our representative over there, and, due to the character of the war we engaged in, I do not think that the naval part of it should be given any more authority than was given in this case.

The CHAIRMAN. Then you do not believe that in the case of Admiral Sims he should have been given the maximum of initiative in carrying on his mission?

Admiral BENSON. I think he had that, sir. Admiral Sims never had anything to do, as I recall it, with a single operation.

The CHAIRMAN. Then you do believe he ought to have been given the maximum of initiative?

Admiral BENSON. I do not quite get that.

The CHAIRMAN. You do believe that he should have been given the maximum of initiative in carrying on his mission over there?

Admiral BENSON. In carrying on his mission, if he had properly understood his mission, yes.

The CHAIRMAN. If he had properly understood his mission?

Admiral BENSON. Yes.

The CHAIRMAN. You do not think he properly understood his mission?

Admiral BENSON. I do not think he realized just the extent to which he was—judging from his letters, that he did.

The CHAIRMAN. Do you think he did good service on the other side?

Admiral BENSON. I think he did excellent service.

The CHAIRMAN. In what way did he not realize the functions he was performing?

Admiral BENSON. I am simply judging from the reports which he made to the Secretary of the Navy that he had an exaggerated idea of what his mission was.

The CHAIRMAN. But did this exaggerated idea appear during the war, and did it do any damage during the war?

Admiral BENSON. I do not think it did any damage. I think he often asked for things and wanted things which I did not consider altogether necessary to grant, and did not grant.

The CHAIRMAN. Sound military policy requires the operational plans in the direction of operations should be made only on full information, does it not?

Admiral BENSON. Yes.

The CHAIRMAN. And he probably had more information about matters over there than you did, did he not?

Admiral BENSON. Of the particular part that he was dealing with. He had to get his information from the various parts of the field over there, from those in the field.

The CHAIRMAN. Now, if there was doubt in Admiral Sims's mind about his functions on the other side, or if he assumed too much, why was he not given fuller instructions when he went abroad as to just what his functions should be?

Admiral BENSON. If you will recall, he was sent over under very peculiar circumstances. We were not at war when he went over, and the situation was such that you could not give him much, as I understand the situation. I do not see how we very well could have given him any more explicit instructions than he received. As I said yesterday, or the day before, I did not give Admiral Sims his definite and particular instructions. My impression is, although I do not know that, that they were given by the Secretary.

The CHAIRMAN. He was at all times within reach, was he not, by cable or by letter?

Admiral BENSON. Yes.

The CHAIRMAN. If you thought that he was assuming too much on the other side, why did you not outline just what his duties should be?

Admiral BENSON. I think he had sufficient instructions, Mr. Chairman, for the duties that he was called upon to perform.

The CHAIRMAN. I know, but you stated that he was taking more on himself than he should.

Admiral BENSON. You asked me why I did not.

The CHAIRMAN. Yes.

Admiral BENSON. I will answer that by saying I did not think it was necessary.

The CHAIRMAN. And you did say he was taking on his shoulders more than belonged to him?

Admiral BENSON. I do not think I made that statement. I said I thought he had an exaggerated idea of what his mission was.

The CHAIRMAN. That would necessarily govern his actions in regard to his mission, would it not?

Admiral BENSON. Yes.

The CHAIRMAN. But if you found that his exaggerated idea was causing him to do things that he should not have done, why did you not call him down?

Admiral BENSON. I did not think that he was doing things that he should not have done.

The CHAIRMAN. Then what harm did it do for him to have this exaggerated idea?

Admiral BENSON. I did not say that it was doing any harm. If I had thought that he was doing harm, I should have given him very definite instructions.

The CHAIRMAN. Then it did not do any harm?

Admiral BENSON. I did not give him such instructions because I did not think it was necessary.

The CHAIRMAN. Then he did not do any harm?

Admiral BENSON. He did not. I thought he was doing most excellently.

The CHAIRMAN. Then he was not doing things that he should not have done?

Admiral BENSON. I do not think he did. I do not recall any.

The CHAIRMAN. Then his fault is simply that he stated in his letter that he was not properly supported on the other side?

Admiral BENSON. My idea of it is, I would not call it fault. My idea of it is that he had.

The CHAIRMAN. You think it was unfortunate that he made this report?

Admiral BENSON. I do; most decidedly, sir.

The CHAIRMAN. Of course there might be a conflict of opinion about that, Admiral.

Admiral BENSON. You have asked my opinion, sir, and I felt I should give it.

The CHAIRMAN. Did you in any way encounter any opposition to carrying out the policies outlined by Admiral Sims in any of his recommendations?

Admiral BENSON. Any opposition? May I ask, sir, in what respect?

The CHAIRMAN. From the Secretary or anyone else.

Admiral BENSON. I do not think ever, sir. As a matter of fact, I think the Secretary was very anxious, as far as possible, to carry out those things, but he left it, as I stated a little while ago, largely to my advice.

The CHAIRMAN. So that if there was any opposition or any delay, you yourself were personally responsible?

Admiral BENSON. I would be responsible for it; yes, Mr. Chairman.

The CHAIRMAN. Have you anything, Senator Ball?

Senator BALL. Not now.

Senator KEYES. I have nothing.

The CHAIRMAN. Senator Pittman?

Senator PITTMAN. Admiral, Admiral Plunkett, testifying before this committee, testified as follows, at page 1291 of the typewritten record. [Reading:]

At the end of March, 1917, when we were on the verge of entry into the war, the gunnery was at the highest state of efficiency that it had been in the history of the American Navy.

Do you agree with that statement or not?

Admiral BENSON. I believe it was, sir; and may I give my reasons particularly for that?

Senator PITTMAN. Certainly.

Admiral BENSON. It was because we had developed the long-range firing with great accuracy to a much greater extent than ever before. That was particularly the case; and the fire control was so much better.

Senator PITTMAN. Admiral Fletcher, who testified before this committee, testified as follows, on page 2250 of the typewritten record. [Reading:]

From my knowledge of the conditions of other navies, there is no question in my mind that the Navy of the United States, notwithstanding its shortcomings, when it entered the war was just as well prepared as any other navy in the world when the Great War burst forth.

Do you agree with that statement?

Admiral BENSON. Well, I think possibly, Senator, that the German Navy, in a great many details, was probably better prepared in personnel and certain other points, than our Navy was at that time, and it was probably a better balanced force, and all.

Senator PITTMAN. This testimony, as I take it, is to the effect that our Navy, on April 6, 1917, was as well prepared for entry into the war as were any of the other navies at the time of the breaking out of the war in 1914.

Admiral BENSON. I understand that, sir; and I say, with what we had, it was; but I think that the German Navy was undoubtedly

better prepared in personnel, and possibly in the balance of the naval forces.

Senator PITTMAN. Then, you would qualify the testimony of Admiral Fletcher to that extent?

Admiral BENSON. I would, sir. That is my opinion, of course, Senator.

Senator PITTMAN. Then, I understand that it is your opinion that our Navy was as well prepared on April 6, 1917, as any of the navies of our Allies were prepared in 1914, when they entered the war?

Admiral BENSON. Well, with what we had, I would say yes, with the possible exception that the Allies may have been better prepared in personnel than ours was.

Senator PITTMAN. Did not the General Board in 1915 prepare an estimate for the personnel of the Navy?

Admiral BENSON. I think they did every year, sir.

The CHAIRMAN. And is it not a fact that when that recommendation was acted upon by Congress in the session of 1915-16, Congress carried out that recommendation as to personnel?

Admiral BENSON. I would have to consult the records of the department, Senator, to give you that definitely. I think it is a matter of record, though, but I could not, offhand, from my personal recollection, state whether it did or not.

Senator PITTMAN. Well, it was testified to here. The actual records of the facts have been placed before the committee.

Admiral BENSON. Yes.

Senator PITTMAN. And I simply called attention to it for the benefit of the committee at the present time.

Admiral BENSON. Yes.

Senator PITTMAN. My recollection of it is that they did grant the personnel recommended by the Secretary.

Admiral BENSON. Increases were granted right along, but whether they complied fully with the recommendations, I could not state.

Senator PITTMAN. Admiral Badger, in testifying before this committee, testified as follows (pp. 2624, 2626, 2634, and 2646 of type-written record). [Reading:]

Always bearing in mind the difference in size and power between the British and German fleets and our own in 1914, I do not hesitate to say that we were as well prepared as to our Navy when we entered the war as were the other belligerents in 1914. (P. 2624.)

The Navy Department always had in view the things necessary to be done in case we entered the war. I will read, with your permission, a letter marked "B," from the General Board, dated March 13, 1915, approved and put into effect immediately. It proved of great value in expediting and coordinating the department's preparations for war. As the reports came in, the General Board examined them, noted progress made or the reverse, and returned them with comments to the department. * * *

On February 4, 1917, the General Board forwarded a communication to the department, a plan of procedure to meet a possible condition of war with the central European powers. I will ask your forbearance while I read it in order to show that the department was neither neglectful nor ignorant of the critical situation, as has been charged. (P. 2634.) * * *

On March 20, 1917, war being imminent but we being still neutral, precautionary measures for the protection of American shipping were recommended. (P. 3646.) * * *

Also on the same date a paper on the same subject, "Assistance that the United States can give the Allies upon declaration of war," was submitted.

I take it that as far as the first paragraph I read is concerned, you agree with Admiral Badger, except as you have qualified your testimony?

Admiral BENSON. Yes, sir; and I would like to state further, Senator, that I do not feel that there is any more able naval authority anywhere than Admiral Badger, or one who is better competent to give an opinion. He was practically the chairman of the general board, had been there for some time, and had all of these points under daily observation and study, and I would unhesitatingly accept what he said in regard to such matters.

Senator PITTMAN. Admiral Wilson, in testifying before this committee, testified as follows. I read from page 2160 of the typewritten record. [Reading:]

I have no hesitation in saying that no nation upon the approach of war has had a force of battleships more nearly prepared for battle than was the force to which I was attached and which spent the winter of 1916-17 in southern waters; and I feel sure that if this force had engaged an enemy on its cruise north in the spring of 1917, the victory would have been ours.

Do you agree with that opinion or not?

Admiral BENSON. I do with regard to the condition of the battleships, unless the Germans, knowing that they were going to declare war, prepared theirs in greater detail right up to the minute. Admiral Jellicoe's book would indicate that with the exceptions that I have noted, our fleet was in certainly much better condition at the time than the British fleet was when they entered the war.

Senator PITTMAN. Admiral Mayo, in testifying before this committee, testified as follows, beginning at page 1454 of the typewritten record. [Reading:]

When the active fleet arrived in Hampton Roads about the 1st of April after its training period in Cuban waters, it was in the best state of preparedness that it had ever been, and there was a feeling of confidence in the personnel of being able to cope with any emergency; the personnel was, however, on a peace basis and the transfer of trained personnel for armed guard and other duty was already being felt in a decrease in efficiency. The destroyers that were first despatched to the war zone, though they were assigned to operations for which they had not been specially trained, showed the effect of their general training by the efficiency with which they at once entered into their new duties.

I will ask you whether you agree or disagree with that comment.

Admiral BENSON. I would agree that Admiral Mayo's statement as commander in chief, in regard to the matter, certainly should be accepted; and I believe, with the exceptions that I have noted, he is correct. Of course, as I have already stated, in sending our battleships even then, in the condition they were, away, or opportunities offering there might have been little details in material, and so forth, that would be well to look after. Upon general principle I think he is correct, sir.

Senator PITTMAN. In other words, there is quite a distinction, is there not, in military science, between being prepared for war and being prepared for an immediate battle with an enemy?

Admiral BENSON. Yes; I think there is.

Senator PITTMAN. It has been testified here that upon our entrance into the war, had the German fleet attempted to cross the Atlantic Ocean to our shores, in the opinion of the witness, who was Admiral Wilson, the victory would have been ours. What is your opinion in regard to that?

Admiral BENSON. I think if the German fleet had met ours with its full force of cruisers, battle cruisers, destroyers, and so forth it would have been very doubtful.

Senator PITTMAN. Admiral Wilson, as I remember the testimony, took into consideration and testified with regard to the difficulties in the fleet crossing the Atlantic Ocean and fighting on our shores. In your opinion would that have had any bearing on the result?

Admiral BENSON. That would have had a decided bearing, but of course I am treating this as a theoretical proposition or a hypothetical proposition. I do not want to be understood as believing that we could not have defeated the German fleet; but I am simply treating it as a hypothetical proposition.

Senator PITTMAN. I realize that it is a hypothetical proposition, because it was beyond the realm of possibility, was it not, Admiral, for the German fleet to come, intact, at that time into the Atlantic Ocean?

Admiral BENSON. Absolutely, sir.

Senator PITTMAN. And as Chief of Operations you were dealing with facts that then existed, and not with theories that might have existed?

Admiral BENSON. I was, sir.

Senator PITTMAN. I only asked that question by reason of the fact that the chairman, or those who were directing his cross-examination, seemed to feel that that was a very important question.

Now I have here what purports to be a plan—a basic plan, as I take it—by the General Board. It is as follows. [Reading:]

FEBRUARY 4, 1917.

G. B., No. 425 (confidential). Serial No. 666.

From: Senior member present.

To: Secretary of the Navy.

Subject: Steps to be taken to meet a possible condition of war with the central European powers.

On account of existing conditions, the General Board recommends that the following steps be taken to meet a possible condition of war with the central European powers:

1. Complete complements and allowances of all kinds, first of the A and B fleet, then of the C fleet, and naval districts.

2. Mobilize the A fleet in the lower Chesapeake, and increase it immediately to the B fleet. (See Black plan.)

3. Dock and repair all ships in reserve and ordinary that will be used.

4. Arrange for the supply of fuel to the fleet and stock all fuel depots to capacity.

5. Establish additional recruiting stations and increase personnel of the Navy and Marine Corps to the total number required to supply complements for all the ships built, building, and authorized, and to maintain shore establishments and naval defense districts, including aviation service, with 10 per cent additional for casualties as follows: Enlisted force: Navy, 150,000; Marines, 30,000. Officers in the proportions prescribed by law.

6. Mobilize the naval districts, including the Coast Guard and Lighthouse Services and put patrol vessels, mine sweepers, etc., of the Atlantic coast districts, on their stations; no commercial vessels to be mobilized in the Pacific coast districts at present.

7. Prepare to the utmost detail for the employment of mines along our coast as may be necessary.

8. Prepare nets and other obstruction for submarines, ready for immediate use, at the Chesapeake capes, Delaware capes, entrance to New York Bay, eastern entrance to Long Island Sound, Narragansett Bay, Panama Canal, and Guantanamo. Other places as their need becomes apparent. The General Board considers it of the utmost importance that net protection shall be immediately provided for the fleet during its mobilization in Chesapeake Bay.

9. Establish immediately the guards at all navy yards, magazines, radio stations, powder factories, munition plants, bases, shipbuilding yards, and naval shore utilities in accordance with the mobilization plans.

10. Reduce the force of marines in Haiti and Santo Domingo to the smallest number that can maintain order there; transferring these men to the United States to perform necessary guard duty at navy yards, magazines, radio stations, shipbuilding plants, and to form cadres for the organization of new regiments as recruits are obtained. Organize the advanced base force and complete its equipment.

11. Leave in the Caribbean a sufficient number of light cruisers to keep a lookout for submarines in those waters and for the protection of our interests there. Protect the canal and Guantanamo as far as possible, by the use of mines, and where possible by monitors, submarines, and nets.

12. For the present use the greater part of the destroyer flotillas as patrol for submarines in the vicinity of the principal ports or entrances leading to them.

13. Base the submarines at canal, Guantanamo, and points along the coast in accordance with the Black plan.

14. Rush to completion all naval vessels building or authorized; also build up the Aviation Service as rapidly as possible.

15. Guard all bays and harbors on the coast of Maine, to prevent their use as bases of supply. Patrol waters of Haiti, Santo Domingo, Porto Rico, and Danish West Indies; Cuban Coast Guard Service to assist in patrolling all bays and gulfs of the coast of Cuba.

16. Prepare to close entrances to all ports at night and discontinue or change such aids to navigation as may be necessary.

17. Organize a comprehensive system of intelligence service covering the whole theater of war in accordance with the plans of the Office of Naval Intelligence.

18. Take possession of all interned vessels of war of Central Powers, also take control of all commercial vessels of Central Powers now in United States waters.

19. Place under surveillance all citizens of the Central Powers in the Navy or in Government employ in naval establishments and remove them from positions in which they may do possible harm.

20. Arm our merchant vessels for purposes of defense.

21. In accordance with Black plan carry out the following:

(a) Issue proclamation prescribing defensive sea areas and put rules in regard to them in force.

(b) Issue proclamation prescribing press regulations and establishing censorship of cable and radio, including naval control of all commercial and private radio stations.

(c) Issue President's order in regard to visit and search, capture, etc.

22. And, as most important, arrange as soon as possible plans of cooperation with the naval forces of the Allies for the joint protection of trans-Atlantic commerce, and for offensive naval operations against the common enemy.

CHAS. J. BADGER.

(Copy furnishing Admiral Benson Mar. 6, 1917.)

I have another order here from the General Board, which I will read. It is as follows [reading]:

G. B. No. 425. (Serial No. 699.)

APRIL 5, 1917.

Confidential.

From: Senior member present.

To: Secretary of the Navy.

Subject: Assistance that United States can give the Allies upon declaration of war.

References: (a) General Board's letter, G. B. No. 425 (serial No. 666), February 4, 1917, steps to be taken to meet a possible condition of war with the Central European Powers.

(b) General Board's letter, G. B. No. 425-1 (serial No. 553-b), February 6, 1917, Black plan, tactical problem I.

(c) General Board's letter, G. B. No. 425-1 (serial No. 672), February 17, 1917, solution of problem, Black.

(d) General Board's letter, G. B. No. 425 (serial No. 683), March 17, 1917, estimate of the situation as to system of patrol and sweeping best adapted for protection of shipping off port of New York.

(e) General Board's letter, G. B. No. 425 (serial No. 689), March 20, 1917, protection of American shipping.

The General Board believes that the mission of our Navy when war is declared against Germany will best be determined by arrangement with the allied powers

now engaged in war with that country. We should immediately obtain from the allied powers their views as to how we can best be of assistance to them and as far as possible conform our preparations and acts to their present needs, always bearing in mind that should peace be made by the powers now at war we must also be prepared to meet our enemies single handed. We should not depend upon the defensive, but prepare for and conduct a vigorous offensive.

2. This recommendation has already been made by the General Board, references (a) and (e), and is as follows:

"And as most important, arrange, as soon as possible, plans of cooperation with the naval forces of the Allies for the joint protection of trans-Atlantic commerce and for offensive naval operations against the common enemy.

The General Board wishes to emphasize strongly the necessity of such preliminary arrangement, in order that economy of effort and concentration of purpose may become effective as early as possible.

3. The General Board suggests that consideration be given to the following measures in anticipation of cooperation with Allies:

(a) Protect shipping proceeding to and from our ports from submarine or other attack;

(b) Prevent the use of unfrequented bays or harbors on our own coasts, in the Gulf of Mexico and the Caribbean from use by submarines as bases;

(c) Take over as far as may be desired and practicable the patrol of trade routes in the western, north, and south Atlantic and eastern Pacific, and prevent the exit of enemy merchant ships now finding asylum in the South American ports;

(d) There is no doubt that, if desired by the Allies, sending immediately a number of destroyers to cooperate with the allied powers in the barred zones would greatly add to the moral effect, at home and abroad, of the participation of the United States in the war. The numbers of this type which may eventually be sent abroad will depend upon the development of a German offensive on this side of the Atlantic, our immediate needs, and the increase of this type in our Navy;

(e) Should United States troops be sent to Europe it will be necessary to escort the transports from shore to shore. At present we are short of transports and conveying vessels, and cooperation in this duty with the Allies would be necessary;

(f) The transportation of supplies for the Entente Allies is of the first importance. Requisition all enemy merchant ships detained in our ports, and seize enemy converted ships interned, repair them and place them in service as transports or supply ships;

(g) Mobilize the shipbuilding industries, both commercial and governmental, so that the energies of the Nation be extended in the directions needed to provide vessels to combat submarines, to escort merchant shipping, to replace shipping destroyed, and for other necessary additions to the fleet;

(h) Keep constantly in view the possibility of the United States being in the not distant future compelled to conduct a war single handed against some of the present belligerents and steadily increase the strength of the fighting line, large as well as small vessels—doing this with as little interference with the rapid building of destroyers and other small craft for the Navy, and cargo ships for the Merchant Marine as possible;

(i) Manufacture the number of medium caliber guns which will be needed for merchant shipping and patrol craft.

CHARLES J. BADGER.

The CHAIRMAN. What was the date of that?

Senator PITTMAN. April 5, 1917, the day before we declared war.
[Continuing reading:]

NAVY DEPARTMENT,
Washington, June 8, 1917.

Subject: Assistance that United States can give Allies upon declaration of war.
Memorandum for the General Board.

The recommendations contained in the General Board's letter, G. B. No. 425, dated April 5, 1917, have been received and action has been taken, as follows: All recommendations acted upon favorably and measures taken in accordance therewith so far as possible.

By direction of the Secretary.

F. H. SCHOFIELD.

I have another report of the General Board of April 5, 1917, which is as follows. [Reading:]

G. B. No. 425-A. (Serial No. 700.)
Confidential.

APRIL 5, 1917.

From: Senior member present.

To: Secretary of the Navy.

Subject: Detail of a commission of officers to Great Britain and France.

In view of the existing state of war and the value to us of definite technical information as to methods of naval operations developed by the Allied powers in the present war, the General Board believes that steps should be taken immediately to get all the practical information possible for our guidance in our own operations and in order that we may heartily and efficiently cooperate with the Allies.

2. The General Board therefore recommends that negotiations be immediately entered into with Great Britain and France to send experienced naval officers to the United States to give information, and also obtain permission for two commissions of our own naval officers to visit England and France, respectively, so that they may as rapidly as possible acquire the desired information at first hand.

3. The main points on which information is desired are as follows:

- (a) Methods of placing nets, mines, and obstructions, and their character.
- (b) Methods of mine sweeping and countermining.
- (c) Methods of submarine detection, chasing, capture, and destruction.
- (d) Types of antisubmarine vessels and of aircraft for all naval purposes.
- (e) Methods of patrol, escort, and convoy for the protection of both merchant shipping and naval forces against submarines and mine menace.
- (f) Methods of communication actually employed in antisubmarine warfare.
- (g) Methods and codes to be employed by our forces in cooperating with those of the Allies.

(h) Best methods and manner of cooperation and nature of service to be rendered by our forces particularly in escorting merchant shipping.

4. The General Board recommends that the commission be constituted of officers on the active list as follows:

Great Britain.—One rear admiral, one captain, two commanders, five lieutenant commanders or lieutenants, one naval constructor.

France.—One rear admiral, one captain, one commander, two lieutenant commanders or lieutenants, one naval constructor.

The General Board recommends this number of officers so that the work can be divided up and expedited, and believes that if this number of officers is detailed the information desired can be obtained in about two months.

CHAS. J. BADGER.

APRIL 5, 1917.

Memorandum for the Chief of Naval Operations.

Names suggested for commissions, to be sent abroad to obtain information as to methods of prosecuting naval war abroad:

France.—Rear Admiral T. S. Rodgers, Capt. H. H. Hough, Commander David F. Sellers, Lieut. H. H. Crosby, Lieut. Wadleigh Capehart, Naval Instructor W. G. Gilmer.

England.—Rear Admiral W. S. Sims, Capt. W. V. Pratt, Commander Yates Stirling, Commander F. H. Clark, Lieut. F. A. Daubin, Lieut. G. L. Caskey, Lieut. S. C. Hooper, Naval Constructor E. S. Land.

Sent in accordance with your request.

CHAS. J. BADGER.

NAVY DEPARTMENT,
Washington, June 9, 1917.

Subject: Detail of commission of officers to Great Britain and France.

Memorandum for the General Board.

The recommendations contained in the General Board's letter, G. B. No. 425-A, dated April 5, 1917, have been received this date and action has been taken as follows: Officers are making investigations.

By direction of the Secretary.

F. H. SCHOFIELD.

I have here a communication by the Secretary to the General Board, dated March 20, 1917, which is as follows:

NAVY DEPARTMENT,
Washington, March 20, 1917.

Confidential.

To: The General Board.

Subject: Protection of American shipping.

1. The President directs me to call upon the General Board to outline the measures that the Navy can employ for the most effective protection of the merchant shipping to European ports, in addition to the armed guards that have already been undertaken. It is desired that every character of protection to this merchant shipping be considered by the board, and recommendation be made as to what additional agencies can be employed to protect American lives and American shipping.

2. This specific question—the fullest and most ample protection of this shipping—is the immediate problem committed to the Navy, and its duty to spare no effort or expense for such protection is imperative, and it is to the answer of this pressing problem that the recommendations of the General Board should apply.

3. Expedite report and embody specific recommendations.

JOSEPHUS DANIELS.

The General Board replied the same day.

(At this point, at 12.10 o'clock p. m., the subcommittee adjourned until tomorrow, Saturday, May 8, 1920, at 10 o'clock a. m.).

NAVAL INVESTIGATION.

SATURDAY, MAY 8, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235 Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, and Pittman.

TESTIMONY OF ADMIRAL W. S. BENSON—Resumed.

The CHAIRMAN. The committee will come to order. Senator Pittman, will you proceed with your questions?

Senator PITTMAN. On yesterday I was reading into the record certain reports or recommendations from the General Board, and I was interrupted in that reading, and I would ask permission to place those in the record. There were two more, I think, that I had before me, and I will not take the time to read them into the record.

The CHAIRMAN. What were those?

Senator PITTMAN. They were reports of the General Board to the Secretary.

The documents referred to by Senator Pittman are here printed in full in the record, as follows:

G. B. No. 425. (Serial No. 688.)

MARCH 20, 1917.

Confidential.

From: Senior member present.

To: Secretary of the Navy.

Subject: Safety of lives and property of United States citizens on board American ships on high seas.

The question orally submitted to the General Board by the Chief of Operations on the afternoon of March 19, 1917, is in substance as follows:

Does the General Board think that under the present situation everything has been done that can be done to insure the safety of lives and property of United States citizens on board American ships on the high seas? If not what does the General Board recommend be done in addition?

2. The General Board is of the opinion that everything possible under the circumstances for the protection of American lives and property on the high seas is not being done.

3. In its letter, G. B. No. 425 (serial No. 666), February 4, 1917, the General Board made recommendations as follows looking to the protection of the lives and property of Americans on the high seas:

"(On account of existing conditions, the General Board recommends that the following steps be taken to meet a possible condition of war with the central European powers:

"(1) Complete complements and allowances of all kinds, first of the A and B fleet, then of the C fleet, and naval districts.

1939

"(2) Mobilize the A fleet in the Lower Chesapeake, and increase it immediately to the B fleet. (See black plan.)

"(3) Dock and repair all ships in reserve and ordinary that will be used.

"(4) Arrange for the supply of fuel to the fleet and stock all fuel depots to capacity.

"(5) Establish additional recruiting stations and increase personnel of the Navy and Marine Corps to the total number required to supply complements for all the ships built, building, and authorized, and to maintain shore establishments and naval defense districts, including aviation service, with 10 per cent additional for casualties, as follows:

Enlisted force, Navy, 150,000; marines, 30,000; officers in the proportions prescribed by law.

"(6) Mobilize the naval districts, including the Coast Guard and Lighthouse Services, and put patrol vessels, mine sweepers, etc., of the Atlantic coast districts on their stations; no commercial vessels to be mobilized in the Pacific coast districts at present.

"(7) Prepare to the utmost detail for the employment of mines along our coast as may be necessary.

"(8) Prepare nets and other obstruction for submarines, ready for immediate use, at the Chesapeake Capes, Delaware Capes, entrance to New York Bay, eastern entrance to Long Island Sound, Narragansett Bay, Panama Canal, and Guantanamo. Other places as their need becomes apparent. The General Board considers it of the utmost importance that net protection shall be immediately provided for the fleet during its mobilization in Chesapeake Bay.

"(9) Establish immediately the guards at all navy yards, magazines, radio stations, powder factories, munition plants, bases, shipbuilding yards, and naval shore utilities in accordance with the mobilization plans.

"(10) Reduce the force of marines in Haiti and Santo Domingo to the smallest number that can maintain order there, transferring these men to the United States to perform necessary guard duty at navy yards, magazines, radio stations, shipbuilding plants, and to form cadres for the organization of new regiments as recruits are obtained. Organize the advanced base force and complete its equipment.

"(11) Leave in the Caribbean a sufficient number of light cruisers to keep a lookout for submarines in those waters and for the protection of our interests there. Protect the canal and Guantanamo as far as possible by the use of mines, and where possible by monitors, submarines, and nets.

"(12) For the present use the greater part of the destroyer flotillas as patrol for submarines in the vicinity of the principal ports or entrances leading to them.

"(13) Base the submarines at canal, Guantanamo, and points along the coast in accordance with the Black plan.

"(14) Rush to completion all naval vessels building or authorized; also build up the Aviation Service as rapidly as possible.

"(15) Guard all bays and harbors on the coast of Maine, to prevent their use as bases of supply. Patrol waters of Haiti, Santo Domingo, Porto Rico, and Danish West Indies; Cuban Coast Guard Service to assist in patrolling all bays and gulfs of the coast of Cuba.

"(16) Prepare to close entrances to all ports at night and discontinue or change such aids to navigation as may be necessary.

"(17) Organize a comprehensive system of intelligence service covering the whole theater of war in accordance with the plans of the Office of Naval Intelligence.

"(18) Take possession of all interned vessels of war of Central Powers, also take control of all commercial vessels of Central Powers now in the United States waters.

"(19) Place under surveillance all citizens of the Central Powers in the Navy or in Government employ in naval establishments and remove them from positions in which they may do possible harm.

"(20) Arm our merchant vessels for purposes of defense.

"(21) In accordance with black plan carry out the following:

"(a) Issue proclamation prescribing defensive sea areas and put rules in regard to them in force.

"(b) Issue proclamation prescribing press regulations and establishing censorship of cable and radio, including naval control of all commercial and private radio stations.

"(c) Issue President's order in regard to visit and search, capture, etc.

"(22) And as most important, arrange as soon as possible, plans of cooperation with the naval forces of the Allies for the joint protection of trans-Atlantic commerce and for offensive naval operations against the common enemy."

4. The General Board renews these recommendations, believing as it does that they all have a pertinent bearing upon the protecting of the lives and property of American citizens on the high seas, and that the illegal acts and claims of Germany on the high

seas have created, in the opinion of the General Board emphasizes as of first importance the mobilization of the naval forces, material, and personnel; the arming of merchant ships; and arranging for the cooperation with the allied powers, which must exist if our shipping is to be adequately protected in the "barred zones."

CHARLES J. BADGER.

MARCH 20, 1917.

G. B. No. 425-A. (Serial No. 689.)

Confidential.

From: Senior member present.

To: Secretary of the Navy.

Subject: Protection of American shipping.

Reference: Secretary of the Navy's confidential letter, March 20, 1917.

1. Of the measures advocated by the General Board in its letter of February 4, 1917, G. B. No. 425, Serial No. 666, especial attention is invited to the following which bear directly upon the protection of our commerce in transit between the United States and Europe:

(a) Escort vessels to deep water from our ports and similarly from deep water to our ports.

(b) Arrange with British and French Governments for the convoy of our merchant ships through the barred zones.

(c) Merchant ships to proceed on high seas from points of leading and receiving escorts, depending upon their guns for protection, and upon changes of course to follow alternate routes.

(d) Arrange with British and French Governments a code of signals to be used in directing merchant ships as to routes to be followed and points of meeting escorts.

(e) Establish a patrol of the Atlantic coast.

(f) Recruit up to the limit allowed by law for emergencies in order to provide crews for patrols and auxiliaries and fill battleship complements which have been depleted to supply gun crews to merchant ships.

2. In order to obtain what the General Board regards as the greatest measure of protection to American lives and American shipping on the high seas, the General Board invites attention to its letter of March 20, 1917, G. B. No. 425, Serial No. 688, and of its previous letters of February 6, 1917, G. B. No. 425-1, Serial No. 553-b; February 17, 1917, G. B. No. 425-1, Serial No. 672; March 17, 1917, G. B. No. 425, Serial No. 683; on the same subject.

CHAS. J. BADGER.

Senator PITTMAN. Admiral, as I understood your testimony, it was to the effect that in your opinion the winning of the war depended upon the soldiers upon the west front in the field?

Admiral BENSON. Yes.

Senator PITTMAN. You have a general knowledge, of course, of the condition of our Army at the time we entered the war on April 6, 1917.

Admiral BENSON. Generally; yes.

Senator PITTMAN. You have a general idea also of the magnitude of the task of drafting and preparing for the training, and the training, of the Army that we did send to France, and that we had in reserve in this country?

Admiral BENSON. Yes.

Senator PITTMAN. You have testified, I believe, that the submarine menace, while critical, was not very critical, and that in your opinion it did not affect the result of the war.

Admiral, if there had been no submarines, would not the result of the war equally have depended upon the opposing forces upon the west front, as it did?

Admiral BENSON. I believe so; absolutely.

Senator PITTMAN. There seems to be quite an effort to establish the fact that there was some terrible mistake, because we did not have more destroyers in our Navy at the time we entered the war.

There has not been any criticism adduced before this committee because Great Britain did not have more destroyers when they entered the war. But supposing that Great Britain in April, 1917, had had twice as many destroyers as she had, would that in any way have affected the number of soldiers that were placed on the west front?

Admiral BENSON. Not so far as the United States was concerned; no, sir.

Senator PITTMAN. That is what I mean, so far as the United States was concerned.

Admiral BENSON. No; I believe not.

Senator PITTMAN. In other words, all of this investigation as to whether we should have had six subchasers on the other side in April, or 12 or 28, is almost an absurd discussion in considering whether or not we were responsible for a delay of four months in the termination of this great war; is that true?

Admiral BENSON. As I understand and in view of the situation, Senator, to have had more destroyers or submarine chasers or other craft on the other side during the period before we had started our troops over, would have resulted in saving more British and other allied shipping; and to that extent it would have given a moral support to the Allies and supplied them—made them feel more sure with regard to their resources. I do not believe it would have had any other effect whatever.

Senator PITTMAN. In other words, we know from the reports of Gen. Bliss and also from the statements from the Allied War Council, that they were waiting for American soldiers on the west front to give the balance of power to the Allies there where the war must be determined. We know that Gen. Bliss, from his reports, did not expect that we could terminate that war until the following year. You have testified that as fast as the Army had the soldiers prepared to go to the west front, the Navy took them there; is that so?

Admiral BENSON. That is so.

Senator PITTMAN. Yes.

The CHAIRMAN. Senator Pittman, will you refer to the place in the testimony where Gen. Bliss made that statement?

Senator PITTMAN. Yes. Gen. Bliss did not make the statement here, but his report was included in the testimony of witness, which I will show. I will put that testimony in the record. I know that it stands undenied.

The CHAIRMAN. Put in the part that deals with this particular thing.

Senator PITTMAN. I will put that in at this point in the record.

(The matter referred to by Senator Pittman not printed in the record.)

Senator PITTMAN. Those were the material questions that you had to deal with, getting those troops over there.

Now, as a matter of fact, is it not true, Admiral, that while there was a tremendous destruction of tonnage at the maximum of the submarine destruction, even if it had not been reduced, still there would have been sufficient food reaching the allies to have allowed matters to go on to a determination by the armed forces on the west front.

Admiral BENSON. Did you ask if I thought so, sir?

Senator PITTMAN. Yes.

Admiral BENSON. I do think so.

Senator PITTMAN. In other words, the submarine menace in its bearing on this question only deals with the destruction of tonnage and not with the winning of the war?

Admiral BENSON. Yes; I think that it had its demoralizing effect on the allies, and that in that way, of course, made the problem considerably harder.

Senator PITTMAN. Now one of the petty delays, if it might be called a delay—because apparently they call everything a delay that took time for consideration—one of these so-called delays was the time taken by you and your staff in the consideration of the recommendation for the convoy plan. When did the Allies first arrive at a determination on the convoy plan?

Admiral BENSON. To the best of my recollection the first convoy that was attempted, as I think has already been testified to, left Gibraltar about the 1st of May, and I do not think it was regularly taken up as a regular principle by the British until the latter part of June or the early part of July. That is my recollection.

Senator PITTMAN. 1917?

Admiral BENSON. 1917; yes, sir.

Senator PITTMAN. This was a problem, therefore, that was facing the British Admiralty and the other admiralties of our allies and their war councils from the time they entered the war, from 1914 to 1917?

Admiral BENSON. Yes, Senator.

Senator PITTMAN. In other words, there is no criticism of a delay of three years on the part of the Allies in arriving at a determination of this problem, while it is considered a very serious delay, because immediately after we entered the war our department should have taken two or three weeks to investigate the matter; is not that a fact?

Admiral BENSON. I believe so, sir.

Senator PITTMAN. Another criticism, which by reason of the fact that we transferred all the troops we had to transfer, and were ready to transfer, seems to be rather academic, is that you made a mistake in the distribution of the few officers that you had.

Admiral BENSON. I do not believe so, Senator. As I have already stated, the responsibility of how to utilize the forces at our disposal to the best advantage for the common cause was mine, and I exercised my judgment in the way it was done, and as I have also said, I feel that the results justify the correctness of my judgment in the matter.

Senator PITTMAN. Was any navy ever expanded and enlarged any more rapidly than was our Navy after we entered the war?

Admiral BENSON. Why, decidedly not, sir. If I remember the figures correctly, I think we had something over 500,000. In fact, I think possibly at the close of the war we had more men and officers in the Navy than the British had, and were recognized as the largest naval power the world has ever seen.

Senator PITTMAN. And a large portion of that expansion consisted in placing in the service of numerous small craft that required officers; is not that so?

Admiral BENSON. Yes, sir.

Senator PITTMAN. A rather unusual and extraordinary situation in naval warfare of the past?

Admiral BENSON. Well, of course, in our wars, with our long coast to guard, we have always looked to that particular element that would have to be safeguarded.

Senator PITTMAN. Not only did the Navy have the officering of these numerous vessels required by the peculiar character of the warfare upon the seas, but the Navy had to officer a tremendous commercial enterprise as dealing with material; is not that a fact?

Admiral BENSON. Yes, sir.

Senator PITTMAN. The expansion of production in material of the Navy had to be coequal, did it not, with the expansion of the naval operations?

Admiral BENSON. As far as possible, of course.

Senator PITTMAN. As far as possible. Was Admiral Sims in as close touch with the developments of the production and the material and the construction and placing in operation of ships as was your department on this side?

Admiral BENSON. I do not think he could possibly have been, sir. It was not possible for him to.

Senator PITTMAN. Was it possible for him to realize the requirement for officers on this side to the extent that you did?

Admiral BENSON. I do not think it possible for him to do it, sir.

Senator PITTMAN. The questioning would lead to the conclusion that there is a criticism, possibly, of your department for not having more written plans of operation. If you had sent over to Admiral Sims the officers that he asked for, you would have been more crippled in having written plans of operation than you were even, would you not?

Admiral BENSON. Very much more, sir, because the very officers that I depended the most on developing policies that I initiated and developed and ordered to be carried into execution were wanted by Admiral Sims.

Senator PITTMAN. Yes. Admiral Sims was to supply information, which was a very valuable thing. You were to carry out the operations based on that information. Is there any comparison as to the importance of those two services?

Admiral BENSON. Not in my opinion, Senator.

Senator PITTMAN. If Admiral Sims had had all of your staff over there to get information, the information would have been useless without the power on this side to obtain the production of material and the construction to carry that out; is not that a fact?

Admiral BENSON. It is, sir. Might I add there that Admiral Sims got most of his information that was necessary and of greatest value to us directly from the information sources of the British Admiralty, so that his principal effort was in relaying that, I might say, to the Navy Department in Washington?

Senator PITTMAN. Admiral, I had the opportunity and pleasure of being in your offices and your department, together with other members of the Naval Affairs Committee, on numerous occasions from the very beginning of the war and on through, and during that time I always saw British naval officers in your offices. Were they there constantly during the war, or were they there only when I happened to go down there?

Admiral BENSON. They were there, I would say, constantly. Their presence might not be uninterrupted. Of course, there might be short periods, as I stated the other day, when they were out of Washington when they were not here, so that if I wanted to be correct I would say that they were there constantly in the sense that you refer to.

Senator PITTMAN. I have seen those officers assisting in plotting out in your office the information that was received from the other side with regard to the position of submarines, German submarines, and the vessels of the allied and associated powers. Did they often render assistance in that capacity?

Admiral BENSON. Well, Senator, they were constantly there, bringing information that they had and getting the information that we had, and the cooperation in every respect was about as complete as it could have been, not only that of the British, but the other Allies, and we kept no secrets from them. We gave them everything that we had. The relations were most intimate, and I can not recall any incident connected with the complete cooperation between the various navies and their representatives, except possibly one. On one occasion when in the office, which as you remember adjoins mine—there was a very secret office where we only allowed certain people to enter in—in a conference with the French and British naval attachés, discussing some policy that I was carrying out, and a movement of some vessels, the French attaché intimated rather plainly that I was exhibiting too much partiality for the British. I think that is the only little incident that occurred. That I, of course, nipped in the bud at once, and spoke rather severely to the officer under the circumstances, and told him that nothing in the way of disagreements or criticism between the two services could be allowed in my office; that everything must be in perfect harmony; and that if there was any feeling of that kind it must be brought to me directly and the question settled immediately. That is the only incident that I can remember during the whole war.

Senator PITTMAN. These attachés were officers in the navies of their respective countries, were they not?

Admiral BENSON. Yes, sir; and most of them had been actively engaged in the war in various places.

Senator PITTMAN. They were not only officers in these navies, but they had been actively engaged in the war?

Admiral BENSON. Yes.

Senator PITTMAN. And were accredited to you by the governments having these navies?

Admiral BENSON. Accredited to our Government; yes, sir.

Senator PITTMAN. For the services they were performing?

Admiral BENSON. For the services they were performing.

Senator PITTMAN. They were in constant touch with their own governments and their own navies, were they not?

Admiral BENSON. They were in very close touch with them.

Senator PITTMAN. They were intensely interested in obtaining the very best service from our Navy in their behalf, were they not?

Admiral BENSON. They were.

Senator PITTMAN. And it was that intense zeal which brought about this little, slight jealousy, we might term it, rather than any

neglect on their part? In other words, it was the zeal of these officers—these attachés?

Admiral BENSON. You mean with reference to the particular thing I spoke of?

Senator PITTMAN. Yes.

Admiral BENSON. Yes; of course that was it.

Senator PITTMAN. Yes.

Admiral BENSON. But there was really no ground for criticism on the part of the other attaché. But, as you say, of course, he was acting in what he believed to be his earnest duty and in looking out as well as he possibly could for the interests which he represented.

Senator PITTMAN. It simply evidences, as I take it, the complete touch that these attachés had with their own situation, and their zeal to carry out their own particular problems.

Admiral BENSON. Yes; Senator.

Senator PITTMAN. I bring this out for the reason that the report of Admiral Sims to the Navy Department, and his testimony here, would rather indicate that your department would not have known what to do, and possibly would not have done anything, if it had not been for the information he gave you and the explanations that he made. As a matter of fact, your department was working right along, whether it received information from Admiral Sims every day or once a week, was it not?

Admiral BENSON. It was, sir.

Senator PITTMAN. And was working on very definite information every day?

Admiral BENSON. Yes, sir.

Senator PITTMAN. In other words, you were in constant receipt of definite information from all the naval divisions of the Allies, and your own forces, as to the positions of vessels and the probable position and movement of the German submarines?

Admiral BENSON. We had in our office this service, and as soon as it was fully developed we could tell at any hour of the day or night where any of our vessels were, we could tell where the enemy submarines were operating within very close limits, of course, and we had the various fronts. In fact, there was scarcely any one feature of the war either on land or on water, that you could not in my office at any hour, day or night, get almost the exact information that you might want.

Senator PITTMAN. And that information was plotted out constantly so that it was actually visualized?

Admiral BENSON. It was.

Senator PITTMAN. Even a member of the Naval Affairs Committee of the Senate could understand it?

Admiral BENSON. If it was not understood, it could be very easily explained.

Senator PITTMAN. I think, Admiral, that you have been very modest and also very magnanimous in assuming all of these so-called mistakes of a petty and immaterial nature. Knowing the work that you did in the matter, and being convinced that the war was actually won and it is over, so far as the Navy is concerned, I feel that it is unjust to you to allow it to stand there. That is one reason why I have been emphasizing what you have already so modestly

alluded to. There has been an effort here to show that you had no operating plans.

The CHAIRMAN. Excuse me, Senator, there has been an effort to find out whether he had any operating plans.

Senator PITTMAN. Well, I will allow it to go at that rate. I am very glad that there was no intimation that he did not have any.

The CHAIRMAN. There is no question.

Senator PITTMAN. No question, and I trust that it will not be misunderstood by the country or by our Allies.

You have testified that you had definite policies which were carried out. There may be a distinction in naval plans between definite plans and definite policies to be carried out. You surveyed the necessary resources of the country for the Navy, did you not?

Admiral BENSON. I did, sir.

Senator PITTMAN. You surveyed the manufacturing resources of the country essential to the Navy, did you not?

Admiral BENSON. We did.

Senator PITTMAN. You surveyed the available navy yards for the construction of ships, did you not?

Admiral BENSON. We did.

Senator PITTMAN. You surveyed, in general, the material essential to the Navy?

Admiral BENSON. We did.

Senator PITTMAN. These conditions were all before you?

Admiral BENSON. They were.

Senator PITTMAN. You know how they had to be utilized?

Admiral BENSON. I did.

Senator PITTMAN. You decided and determined how they should be utilized?

Admiral BENSON. I did.

Senator PITTMAN. And gave instructions to your staff and subordinates particularly to carry it out?

Admiral BENSON. I did.

Senator PITTMAN. You were in constant touch, were you not, with your chief of staff and assistant, Capt. Pratt, were you not?

Admiral BENSON. Absolutely.

Senator PITTMAN. He was the officer immediately under you who took your orders and commands?

Admiral BENSON. Yes.

Senator PITTMAN. And proceeded to distribute those orders and commands to other officers under him, or coordinating with him?

Admiral BENSON. Yes, Senator.

Senator PITTMAN. You had access to all basic plans and operating plans that he had access to, did you not?

Admiral BENSON. I did.

Senator PITTMAN. Those plans were records of your office, were they not?

Admiral BENSON. They were.

Senator PITTMAN. Now, as you know, Admiral, Capt. Pratt has testified in this matter, and so has Admiral McKean, and they have supplied this committee with all of the evidence of details in their possession, or that they know of, or that have been called to their attention. You requested, did you not, that Capt. Pratt and Admiral McKean be placed upon the stand prior to your testimony?

Admiral BENSON. I did, Senator, for two reasons. First, on account of their position and duties, I knew that they were very much better able to give the committee all of the details that they would want and in such a way that there would be no question about it, and I also wanted them to come before the committee before I did in order not to be influenced in any way by any opinions that I might give expression to or ideas, before the committee, in case I came before them. I wanted them to give their opinions absolutely freely and unrestricted or unbiased, and to the best of my recollection I do not think I have said anything to either one of them before they came on the stand that would have influenced any expression of ideas that they might have had.

In addition to that, for the last two months my mind has been absolutely absorbed in a problem for the good of this country, and the possibilities that may follow the success or failure of what I am now doing are in my mind of very much more value and importance to this country and the danger that may come to it very much greater, than the danger of the German submarine in the late war; and having completed, as I felt satisfactorily to the naval service and to the country, the duties that were imposed upon me as the technical head of the Navy during the war, and having been called upon to assume these new duties, I felt that it was incumbent upon me to give those new duties which were of such tremendous importance, everything there was in me, and I have so done; and for that reason it has been impossible for me to give in detail the information that has been asked for, and I wish to make that statement to the committee as an explanation as to why I have been unable to answer many of the detailed questions that have been put to me.

The reports that you have referred to speak for themselves, and in addition to that, I would request the committee to be allowed to put in the record Appendix B of the report of the Secretary of the Navy for 1916, a statement by the Chief of Naval Operations, which I think will answer a great many of the questions in detail, which, due to my poor memory and the absorbing duties that I have been performing for the last few months, I was unable to recall.

The CHAIRMAN. I have no objection, You indorse, of course, everything that is in that report?

Admiral BENSON. It is my statement.

The CHAIRMAN. And you indorse it now?

Admiral BENSON. I do, sir.

The CHAIRMAN. I have no objection. It will be printed in the record at this point.

(The document above referred to is here printed in full in the record as follows:)

APPENDIX B.

NAVY DEPARTMENT,
Washington, D. C., October 12, 1916.

STATEMENT BY THE CHIEF OF NAVAL OPERATIONS.

1. The Office of Naval Operations, organized in May, 1915, under the Chief of Naval Operations, has continued during the past year the consistent development of its work. In harmony with the department's already confirmed disposition to afford the chief of this office all necessary support for the exercise of his appropriate functions, Congress, by the act approved August 29, 1916, has strengthened the dignity of the Chief of

Naval Operations by conferring upon him the rank of admiral, and has given permanency to the office by providing that he shall have not less than 15 assistants of or above the rank of lieutenant commander in the Navy or major in the Marine Corps. As soon as these officers become available for assignment they will be ordered to duty as provided by law.

2. The experience in the administration of the Office of Operations during the past year has demonstrated that in it lies an effective means of coordinating the complex work of the Navy in harmony with maturely considered plans. The Chief of Naval Operations is, by law, charged, under the direction of the Secretary of the Navy, with the preparation and readiness of plans for the use of the fleet in war. A war plan constitutes a scheme of action, and upon its soundness and completeness will depend the measure of success of our fleet when called upon to meet the test of war.

3. When properly understood, an approved plan becomes the guide for the effort of all executive branches of the department, the accomplishment of which as a whole each branch within its sphere of action must give its loyal adherence. The plans which have been formulated by the General Board and approved by the department have been received by the several bureaus and offices of the department in this loyal spirit, and there has resulted a closer and more efficient cooperation than ever before. Service of the fleet by all shore activities of the Navy, in order that the fleet may serve the Nation, has been accepted by all as a suitable mission.

4. In the work of preparation for war emergencies, and incident thereto in the collection of data relating to sources of supply, two or more bureaus have often covered the same field of inquiry, thus causing unnecessary multiplication of departmental work, and sometimes, unfortunately, causing a very natural irritation to private industrial managers subjected to repeated requests for information already furnished by them to the same department of the Government. To correct this very unbusinesslike practice, a permanent logistics committee of bureau representatives is now charged with the duty of coordinating the work of the several bureaus in collecting logistic data. This committee has also the broader duty of determining and maintaining under the approval of the bureaus, a suitable war reserve of material and of devising methods for reserve expansion when war is imminent. There is a vital necessity for a war reserve for engineering and construction material sufficient to equip our fleet upon mobilization without delay.

5. The inspection of merchant vessels, with a view to their adaptation as naval auxiliaries in war, has continued. This work had formerly been carried on by a naval inspection board independent of the Army, which involved the risk of complication and confusion in the event of war through the fact that a similar inspection was being conducted independently by an Army board with a view to employing such vessels in the Army service. To obviate this there has been organized, through an agreement with the War Department, a board of inspection of merchant vessels, consisting of both Army and Navy officers. No merchant vessels will be inspected hereafter for war service except by this joint board. Merchant vessels already inspected by either the War or the Navy Department, as well as vessels yet to be inspected, will be assigned definitely by the joint board either to the War Department or to the Navy Department. Each department will, when war is imminent, be able by this scheme to act with celerity and in perfect agreement. Like agreements affecting the allotment of the country's ammunition resources to the two departments are in process of adjustment. Other matters connected with the making of plans in which the Army and Navy must cooperate need close association of the two departments for satisfactory settlement. Steps are being taken to make a closer association with the War Department in such matters more easily possible.

6. A carefully thought out plan for the development of naval shore bases and naval stations has been prepared by the General Board, and, in its main features, has been approved by the department. To insure a consistent plan of development of our navy yards and stations in accordance with such a plan a departmental board, on which all bureaus and offices concerned have representation, has been organized. The duty of this board is to advise a logical and scientific scheme of development and to determine the best method of applying the requirements of such scheme to each navy yard. By such systematic procedure each yard will be satisfactorily developed toward its maximum capacity for most efficient service, in conformity with the general approved plan. So, it is hoped, will immature or hasty recommendations for improvements be avoided, and a permanent argument and justification for appropriations recommended will always be at hand based upon sound reasons.

7. In May, 1916, an officer of the rank of captain was given charge of naval districts in the Office of Operations. In accordance with the previously approved plan, the revision of the regulations governing naval districts was begun. A complete study of one district was worked out and was furnished to the commandants of districts as a

type organization, with directions to organize each district along similar lines. This work is now being completed in the most satisfactory manner, and, in addition, the Offices of Naval Communications Service and of Naval Intelligence have prepared rules for obtaining and transmitting information within the naval districts.

8. The adoption of oil as the fuel of our naval vessels, the greatly increased use of fuel oil in commercial pursuits, the rapid depletion of our oil fields, and the difficulty of securing reserve fields to meet the future needs of the Navy, have created a very serious situation. The advantages of oil for naval use are so great that only a compelling necessity should ever force the Navy to consider its abandonment and a return to the use of coal. Such necessity can be avoided only if provision is made in advance to secure the necessary oil reserve. Having in mind these manifest conditions, the department appointed a board of naval officers to give this whole subject earnest consideration, and this board is now making a thorough study of the fuel-oil situation. It is hoped that the board's work of investigation may result in a definite recommendation to the department for a practical solution of this grave problem.

AERONAUTICS.

9. The development of naval aeronautics has continued to receive the department's serious attention, and though progress has not been rapid the difficulties have been met without discouragement, and it is hoped that a type of naval aeroplane adapted for use over the sea and its use from shipboard are now problems near solution.

10. It must not be forgotten that all the wonderful advance in the science of aeronautics has been almost wholly along the lines of service over land and that the service over sea is a new field, involving many unsolved problems widely different from those which have been solved in the land service. The naval aeroplane has its home on a ship, from which it must learn to take its flight and to which it must return to be reclaimed undamaged. The naval aeroplane has no smooth meadow from which to rise and upon which it may alight. It starts from the heaving deck of the scout and may have to rest on its return upon the surface of a stormy sea. Difficulties in the design of motors, of propellers, and of landing floats have been encountered and are steadily being overcome, the solution of these problems being greatly aided by the testing laboratory established at the Washington Navy Yard.

11. An aeroplane constructed after the department's own design is now nearly completed, and is expected to solve many of our difficulties and establish the standard type for future construction.

12. One of our armored cruisers, the *North Carolina*, has been fitted with a practical aeroplane-launching device and, supplied with a number of naval aeroplanes, has joined the fleet to cooperate in fleet work and to develop the tactics of aircraft on the sea. The *West Virginia* and *Washington*, sister ships of the *North Carolina*, have similar equipment installed, and other armored cruisers and scouts will, when opportunity offers to do the work, be fitted in like manner.

REPAIRS TO SHIPS.

13. In the effort to maintain our fleet in a state of constant readiness for efficient service the department's policy abolishing regular overhaul periods at navy yards and requiring that all work within the capabilities of the ship's force and the fleet repair ships be done by these agencies away from navy yards has been adhered to and will be continued. The benefits of such a policy, when thoroughly understood and reduced to practice, will be fully appreciated and will result in an ever-increasing reliance within the fleet upon the fleet's own resources for maintaining its cruising efficiency.

14. That our important ships, under the operation of this policy, still continue to spend prolonged periods at the yards is due to abnormal circumstances existing at this time, when extraordinary work of alterations and repairs are made necessary by radical changes in the fire-control systems of all, the serious shaft troubles of some, and the renewal of boilers in others. These large items of repairs and alterations, of course, could only be taken care of at navy yards.

VESSELS IN COMMISSION IN RESERVE.

15. Vessels which have been placed in commission in reserve, though usually those of older construction, have still a definite military value, which exists so long as they are kept in readiness for active service. If allowed to deteriorate in their material condition or if stripped too bare of their personnel, these ships at once lose most of their military worth, and when so conditioned are virtually stricken from the Navy

list. Under the department's present policy all ships in reserve are to be maintained in material readiness for active service at short notice, with a sufficient large part of their trained crew on board to keep alive knowledge of the ship and to sustain the spirit of efficiency within the ship as a haven to the "green" men that upon commissioning for active service must be placed on board.

16. All reserve ships are organized into the reserve force under the reserve force commander. They are given periodic military inspections and are required to perform an annual program of exercises involving some form of target practice. The reserve force during the past year has been called upon to perform various services and has in all cases answered the call with gratifying performance. On both the east coast and the west coast the reserve ships were given the duty of exercising the Naval Militia on its annual summer cruise of two weeks, and later they embarked nearly 3,000 civilian volunteers for a cruise of four weeks, giving these enthusiastic Americans an opportunity to see something of Navy life and of naval duties on shipboard.

GUNNERY EXERCISES AND ENGINEERING PERFORMANCES.

17. A better systematized and more searching analysis of the performance of ships during the training period preliminary to the gunnery exercises and during gun practice itself, by boards of officers appointed in the fleet, has resulted in the elimination of many faulty methods, in the standardization of good methods, and in a general increase in the knowledge of principles underlying successful gunnery practice.

18. The fleet has carried out the various forms of gunnery exercises prescribed, and the advance in battle efficiency has been maintained. The satisfactory progress noted in my report of last year is being maintained and, though not sacrificing the time necessary for other exercises, more time is being given to fleet gunnery training than in any previous year. Firing at extreme ranges has been carried out successfully, and greater experience with improved fire-control instruments and installations warrant the hope of still better results in the coming year.

19. Improvement in gunnery has not been confined to the battleship force alone, and it is worthy of note that the submarines show an equally satisfactory advance in torpedo work, keeping pace with the improvement noted in both the battleship and destroyer forces.

NAVAL COMMUNICATIONS SERVICE.

20. The naval radio service, under its new name of Naval Communications Service, has continued its past efficient performance in handling the Government radio service, and in addition has taken over the work of handling all telegraph, telephone, and cable communications connected with the naval service outside the fleet. In addition to this work of serving the Government, as well as commercial needs, it has the censorship of radio stations in accordance with the President's neutrality proclamation of August 5, 1914.

21. An interesting demonstration of the progress attained in this interesting field was had on May 6, 7, and 8, 1916, when, in conjunction with the American Telegraph & Telephone Co., the communications service was mobilized for test. The Navy Department was connected by telephone and telegraph with all navy yards and radio stations in the United States. Radio telephone apparatus was installed on board the battleship New Hampshire, and that ship, lying off the capes of the Chesapeake, was able to communicate by radiotelephony with the department in Washington and with the Mare Island Navy Yard in California. The department itself had no difficulty whatever in communicating with the New Hampshire or any of the naval stations in the United States, using a desk telephone as on any ordinary occasion.

22. A new radio station has been completed and put in service at Point Isabel, Tex. This station will be of great service to the merchant marine in that section, as well as to the Government in facilitating communication with vessels in Mexican waters.

23. As an illustration of the growth of the radio service in the past few years, it may be noted that during the period from December 13, 1912, to December 31, 1913, there were handled a total of 12,854 commercial messages, while during the period from July 1, 1915, to June 30, 1916, the number had increased to 97,084. Of course the number of official messages had correspondingly increased, the number for the latter period above mentioned being 628,997.

OPERATIONS OF THE FLEET.

24. Our fleets on the several stations have been actively employed during the past year. In Asiatic waters the conditions in China have long been disturbed, and the unrest of the Chinese people has frequently been made manifest by local revolts and

uprisings of more or less serious magnitude. Our ships on the Chinese coast and especially in the rivers of that country, have rendered important service in keeping in touch with conditions, in sustaining our diplomatic representatives, and, in general, looking out for American interests.

25. The chief duty of the Pacific Fleet has been, as heretofore, service in Mexican waters. Unsettled conditions still continue in that country, and the recurrent threat of danger to the lives of our numerous citizens resident there has kept most of the active ships on the Pacific station, and at times many of the reserve ships distributed along the Mexican coast, ready for any service that the occasion might demand. Beginning in the latter part of June, 1916, and continuing through July, when the safety of Americans in Mexico seemed to be seriously threatened, our ships assisted thousands of our citizens out of that country and provided them transportation to the United States. On the east coast of Mexico the ships of our cruiser force in the Atlantic have performed like service.

26. The Atlantic Fleet has followed an approved annual program of exercises. In the main this program requires a stay in Cuban waters from January to April, during which target practice and tactical exercises are carried out. Then the fleet returns north for docking, repairs, and continued training, including elementary target practice, and participation in the department's annual maneuver.

27. During the year, since October 1, 1915, the battleships *Pennsylvania*, *Nevada*, and *Oklahoma* have been completed and added to our active fleet, and the *Arizona*, which is to be commissioned on the 17th of this month, will soon join them. In addition there have been completed and assigned to active service 10 destroyers and 7 submarines, together with the destroyer tender *Melville* and the submarine tender *Bushnell*.

28. The department's annual strategic maneuver took place in August last off the northern Atlantic coast. In this maneuver 83 vessels were engaged, of which 28 were battleships and 13 were submarines. The operations of the maneuver lasted for four days and developed most interesting and instructive situations for everyone concerned. It is with much gratification that the department noted the thoroughness and completeness with which the plans of the two commanders were treated and the very admirable manner in which the maneuver was carried out.

OPERATIONS IN HAITI AND SANTO DOMINGO.

29. The occupation of Haiti by the expeditionary force of United States Marines, which was initiated in July, 1915, still continues. The Haitien gendarmerie, under officers of the United States Marine Corps, has been organized in accordance with the treaty recently concluded between this Government and that of the Haitien Republic, and as soon as certain administrative details provided for in a supplementary agreement between the two Governments have been satisfactorily arranged it is contemplated that the necessity for continued occupation of that country will cease. The present Government of Haiti gives every evidence of stability and that country is now enjoying a prosperity greater than it has for many years past.

30. The situation in Santo Domingo reached a crisis in May, 1916. The President of that country, Jiminez, abdicated his office and the Santo Dominican Cabinet withdrew from Santo Domingo City, which was then held by an armed force of revolutionists under the revolutionary leader Arias. In cooperation with our minister in Santo Domingo, naval forces were landed and occupied the city for the preservation of order and the protection of lives and property. The revolutionists having later established themselves in the town of Santiago, in the interior, an expeditionary force of marines was dispatched to occupy that town, to disarm all insurgents, and to reestablish order. This work was most efficiently completed, and at this writing there are in existence no known revolutionists in arms against the constituted authority. All disorder in Santo Domingo has been suppressed, and it is hoped that permanent peace, under stable government, will soon be established. There are now 900 marines in Haiti and 1,800 in Santo Domingo.

THE "HECTOR" AND THE "MEMPHIS."

31. On July 15 the U. S. S. *Hector* was wrecked and stranded off Cape Romaine, S. C. The *Hector* at the time of her wreck was proceeding on her usual service as collier from Charleston to the Caribbean and was caught in a severe gale, during which, after being disabled and having become unmanageable, she finally stranded, as stated. Salvage operations are now in progress, though greatly hampered by weather conditions which prevail at this season. No lives were lost in the wreck of the ship.

32. On August 29 the U. S. S. *Memphis*, flagship of the commander of the cruiser force, lying at anchor off the city of Santo Domingo, was driven ashore by heavy seas. This menace came upon the ship suddenly and without any previous warning. All material on board the *Memphis* of value is being salvaged, and an investigation is being held as to the feasibility of salvaging the ship. It is a matter of regret that 40 lives were lost in this wreck, 33 from the swamping of the ship's boats caught in the effort to return to the ship, and 7 killed and 5 injured by the bursting of a steam pipe in the engine room.

W. S. BENSON.

The CHAIRMAN. Senator Pittman, if you will allow me to interrupt, I would like to state that some time before Admiral Benson came on the stand, he wrote me a letter in which he asked that Admiral McKean and Capt. Pratt be allowed to testify before he did so.

Senator PITTMAN. Yes.

The CHAIRMAN. As he wished to have them make their statements freely and entirely unbiased by anything he might say.

Admiral BENSON. And I would like to say that I got a very nice letter from the chairman of the committee in response to that, which I very much appreciated.

Senator PITTMAN. Early in your testimony, Admiral, you stated that professionally you were for preparation for war considerably before we entered the war, but that in your opinion the country was not. As a matter of fact, Admiral, was there not a considerable opposition in the country to the shipment of munitions of war to our allies before we entered the war?

Admiral BENSON. I could only speak from a general impression and from the press, Senator. As I recall it, there was opposition to our doing that; but as I say, I can simply recall in a general way press comments at the time.

Senator PITTMAN. There was quite strong opposition in Congress also, was there not?

Admiral BENSON. How strong it was I could not say. I think there was opposition.

Senator PITTMAN. There was strong opposition in Congress to the arming of merchant vessels before we entered the war, even a very short time before we entered the war, was there not?

Admiral BENSON. I think there was, sir.

Senator PITTMAN. As a matter of fact, is it not within your general knowledge since you have been Chief of Operations that it has always been the disposition of Congress, representing of course the policy of the country and the people of the country, to oppose the enlargement of the Navy in accordance with the professional view of most of the naval officers?

Admiral BENSON. Well, I would reply to that in this way. I think, as I have already said, that their recommendations have not always, or have rarely ever, been completely carried out. I think, if possible, they were more nearly carried out in 1916, and after that possibly; but at no time have they ever been fully carried out, to the best of my recollection.

Senator PITTMAN. In 1915, the European war, of course, was in progress. In the winter of 1915 and 1916, it was rapidly reaching a very critical position. The Navy Department then recommended, as the reports now in evidence show, the largest naval program ever presented to Congress.

Admiral BENSON. In 1916; yes, Senator.

Senator PITTMAN. I think that was presented, however——

Admiral BENSON. Well, whenever it was presented it was passed. It was in 1916. I do not know the exact date.

Senator PITTMAN. It was presented in December, 1915, and acted on later in 1916.

Admiral BENSON. Yes.

Senator PITTMAN. That was really the first definite naval program ever presented to Congress covering a period of years, was it not?

Admiral BENSON. To the best of my recollection it was, except, possibly, I think there was a policy adopted at one time that we could have only one battleship a year, or possibly two battleships a year. That might be designated as a policy. But on a large scale, to the best of my recollection, that is the first regular building program on a large scale that was presented to Congress.

Senator PITTMAN. Yes. This program, as our record here discloses, was a three-year building program. It went to the House of Representatives, as the record discloses, and they spread it over five years, and cut it about half in two. That is the fact that is disclosed by the record. It is true that the Senate Naval Affairs Committee came to the rescue of the Navy Department and reduced the building program to three years, and greatly enlarged it as far as the House provisions were concerned, and then compromised with the House committee in conference. I call attention to that fact for the purpose of illustrating your testimony with regard to what might be the opinion and policy of the people of the country as reflected through its Congress, and the professional policy as reflected through the naval officers.

In that same naval program the General Board of the Navy made recommendations as to increase of personnel. It was the authoritative advice of the naval board, in conjunction with the Chief of Operations, to the Secretary of the Navy. The evidence discloses that the House cut down that recommendation for personnel. I simply bring that out for the purpose of illustrating the difference in professional opinion of naval officers, compared with the opinion of the people of the country as expressed through their Representatives in Congress.

I also say, in justice to the Naval Affairs Committee of the Senate, that they increased it in accordance practically with the report of the General Navy Board.

So you had, as Chief of Naval Operations, the personnel and only the personnel which was recommended by the General Naval Board, and allowed by Congress; and you utilized and distributed the officers of that personnel in the most vital places, did you not?

Admiral BENSON. I did, sir.

Senator PITTMAN. And as you were enabled to increase the officers of your personnel, you allotted more of these officers to the various divisions? For instance, you allotted more of them to Admiral Sims's department?

Admiral BENSON. I recommended that, Senator. In order to be perfectly straight on this proposition, I want to say that as to the question of the personnel I could only recommend, but my recommendations were carried out in the main. But it was particularly with reference to those that were to go abroad.

Senator PITTMAN. Now, there seems to have been a great effort here to sustain everything that Admiral Sims ever said and ever did. For one, I have no objection to it so long as it is entirely just, and not having the purpose of reflecting upon the Navy.

There was quite a difference, was there not, in regard to the necessity for the protection of our coast on April 6, 1917, from what it was six months later?

Admiral BENSON. I think so, because the situation had developed to a certain extent, and we were in a better position to protect it with a greater variety of appliances, and so forth. Our nets were in better shape, and the conditions were better, and we had determined on a policy of practically keeping the fleet in inland waters, behind nets and other protections.

Senator PITTMAN. It was essential, was it not, Admiral, for us to protect our troop ships as they left our coast?

Admiral BENSON. Always; from the time they left the harbor until they reached the docks on the other side.

Senator PITTMAN. And if we had withdrawn from this coast all protection on April 6, 1917, the Germans would undoubtedly have known it, would they not?

Admiral BENSON. They would.

Senator PITTMAN. And they would undoubtedly have taken advantage of that situation?

Admiral BENSON. In my opinion, they would.

Senator PITTMAN. And in that event it would have been a very remarkable thing, if we had attempted to carry our troop ships from our ports, if we had not lost some of them?

Admiral BENSON. I think it would, sir; and I might illustrate my reason for that on the ground that there was a wide extent of ocean within which the German submarine could operate, compared to the areas on the other side, where they were more restricted in their active operations.

The CHAIRMAN. Excuse me, Senator. Senator Ball has called my attention to the fact that in your questions you are stating what you conceive to be the fact and are simply asking the admiral to corroborate it. I replied to the Senator that we are not following the procedure that would perhaps be followed in a court of law.

Senator PITTMAN. Well, to this extent. I happen to be cross-examining this witness, and the method of conducting a cross-examination is entirely different from the method of conducting a direct examination.

The CHAIRMAN. We are not following here any particular procedure that would be used in a court of law.

Senator BALL. It seems to me to be rather unfair. I am not a lawyer and do not know the principles involved, but it seems so to me, to ask a question, then answer that question yourself, draw your own conclusions, and merely ask the witness for his assent to your conclusions.

Senator PITTMAN. Well, of course, on cross-examination, where a witness has already testified on direct examination, it is perfectly competent, and one of the objects of cross-examination is to find out whether or not you have the correct interpretation of what the witness has already testified to.

Senator BALL. Now, that is what I am getting at; and if you will get the admiral's opinion, it would be better; but you ask your question and then answer it yourself, drawing your own conclusion, and then ask him to say if that conclusion is not correct.

Senator PITTMAN. But I am drawing his attention to the particular testimony he has already given, and asking him if he means by that to say so and so.

Senator BALL. No; but it struck me that he was not answering your questions.

The CHAIRMAN. All we are after is information, and I have no particular objection, so far as I am concerned.

Senator PITTMAN. Well, now, there is another question. Admiral Sims, from his testimony, indicates to my mind that he considered the loss of a troop ship as of less importance than the loss of a ship bearing food.

The CHAIRMAN. Will you cite Admiral Sims's statement?

Senator PITTMAN. Well, I think I can show it. I will show it in a moment or two. I ask leave to put in at this point Admiral Sims's testimony.

The CHAIRMAN. Very, well. I think that in each case where you refer to the testimony of a witness you should put it in the record.

Senator PITTMAN. Very well; I was careful to say that it made that impression on my mind.

Senator BALL. The reason that I brought that out, Senator, is this. Many of those questions you asked involved many different projects and many different answers, and when you came to your final conclusion, there was no way in his reply but to cover all of them, probably, in that answer.

Senator PITTMAN. The very object, of course, of my examination is to consolidate the testimony; that is all. It is to get a direct opinion on particular facts which he has already given in a long discussion. That is all. I am simply trying to consolidate. I do not assume that he is going to change his testimony in any way or is going to contradict himself. It is purely for a question of consolidation on certain points which have been covered in various long discussions.

As I was stating before—and I will put it in this way—I am under the impression, whether I am right or wrong, that Admiral Sims has testified in effect that as cruel as it might seem, it was of more importance to protect vessels carrying food than it was to protect vessels carrying troops; and I think that we will find, when I put this evidence in, that the reason he gave was that a few troops on the west front would not affect the result of the war, while an insufficiency of food would cause a complete collapse. Now, we will find out that later.

The CHAIRMAN. I think that latter statement is more in conformity with my recollection.

Senator PITTMAN. I am only giving it as my impression.

The CHAIRMAN. However, the record will show it.

Senator PITTMAN. As I understand, you take exactly the contrary view, Admiral?

Admiral BENSON. I do, Senator.

Senator PITTMAN. You have testified that it was a matter of troops and not a matter of food that was the critical situation in this war—was the determining critical situation.

Admiral BENSON. It was the determining situation. I would not say that the others were not material.

Senator PITTMAN. They were material.

Admiral BENSON. But the question of troops was the most important.

Senator PITTMAN. Yes. You have already testified that even if the submarine menace had maintained its maximum, we would still have gotten food enough and material enough.

Admiral BENSON. I still think we would have, sir.

Senator PITTMAN. Yes. All these matters, Admiral, so far have largely been dealing with minor plans embraced in Admiral Sims's letters or reports, and his testimony before this committee. The vital charge, in my opinion, the charge that affects the standing of our Navy before the world, and you might say the honor of our Government, and which alone in my opinion justifies the appointment of this committee, is the ultimate, serious charge made by Admiral Sims, that by reason of delay in sending forth our antisubmarine craft, and by reason of unpreparedness, we were responsible for an extension of the war for a period of four months, and the consequent loss of 500,000 men. Now, I want to know positively and directly whether you agree with that charge or disagree with it?

Admiral BENSON. I disagree most decidedly, sir, and I would like to be allowed to give my views in regard to it.

Senator PITTMAN. I would be very pleased to hear them, and I have no doubt that the committee would.

Admiral BENSON. As I have stated before, I firmly believe what hastened the close of the war, as far as America was concerned or the United States, in the main was getting American troops on the western front. The one thing that hastened it particularly was the formation of the American army under Gen. Pershing. I do not believe that any possible delay, if such there was, had the slightest effect on lengthening the war, except in this way, that had we not gotten in there, had we not done what we did do, the Allies might have been forced into a peace and ended the war before we got into it, they being the losers and the Germans being the winners. Under no other circumstances could the war have been shortened by what we did or did not. That is the military and naval view, I am satisfied, of those who are in a position to judge, and the mission of the United States Navy in this war, next to protecting our coasts and vessels, was to get our troops into France and keep them and the Allies as far as possible supplied with munitions and provisions.

We carried the troops over—those that we did carry—and we assisted the Allies in what they carried, and we brought our troops back, and to the best of my recollection the Navy never lost an American soldier while it had it in charge.

In 1918 we were getting them over there at the rate of over 300,000 a month, the most wonderful performance that was ever seen or ever dreamed of, and it was due to this fact that the end of the war was hastened; and there has never been any complaint that I know of, or any intimation of any failure on the part of the Navy, either by our Army or anybody in this country, or any of the Allies; no intima-

tion of our failure to act up to the limit in the most enthusiastic and efficient manner, with the means that we had to perform, except the complaint which Admiral Sims has made.

I feel that the complacency or the calmness with which the American people have accepted that statement is a tribute to their sense of fair play, but I must express in the strongest possible language that I think it is an outrage to the American people, I think it is an outrage to the honorable record of the United States Navy; I think if it is allowed to stand it will be the everlasting disgrace of the Navy, and I think that our first arm of national defense will be weakened now and in the future. I think it is particularly hard and outrageous on the nearly 500,000 young men who volunteered in the Navy, and who did such splendid work, and who went back to their homes feeling proud of the service in which they served, and the people that gave them up to the service of the country was proud of them. And I feel very strongly that if there be any doubt or any question in anybody's mind as to this situation, the experts of the Army and every person in the country who is able to form a correct judgment should be called before this committee to give their opinion on it. I feel that it is too serious a charge to be allowed to stand, and I feel very strongly that, as I said in the beginning, it is an outrage on the American people, and particularly on the American Navy.

Senator PITTMAN. Admiral, in the report of the General Board, "G. B., 425, Serial No. 699," to the Secretary of the Navy, under date of April 5, 1917, under article 3, paragraph 8, is the following. This is already in the record of yesterday, but I will repeat it here. [Reading:]

(h) Keep constantly in view the possibility of the United States being in the not distant future compelled to conduct a war singlehanded against some of the present belligerents and steadily increase the strength of the fighting line, large as well as small vessels—doing this with as little interference with the rapid building of destroyers and other small craft for the Navy and cargo ships for the Merchant Marine as possible.

That is the foundation of some questions I now desire to ask.

At the time we entered the war, we were carrying out the three-year naval program adopted in 1916, were we not?

Admiral BENSON. We were.

Senator PITTMAN. Which embraced the building of certain major ships?

Admiral BENSON. Yes.

Senator PITTMAN. Those major ships, of course, were considered by the General Board essential to the completeness and rounding out of our Navy?

Admiral BENSON. They were.

Senator PITTMAN. And yet is it not a fact, Admiral, that by reason of the demand upon this country to utilize all available yards for the construction of small craft, destroyers, most of which would probably be worthless after this particular war, and add no great strength to our Navy, we were compelled to defer and desist from the completion of these major ships under the building program?

Admiral BENSON. Practically in every case.

Senator PITTMAN. To that extent, therefore, our permanent Navy, by comparison with other navies of the world, was greatly weakened, was it not?

Admiral BENSON. In that respect; yes, sir.

Senator PITTMAN. If we had sent our fighting ships immediately to the war zone, they would have been placed in danger of destruction immediately, would they not?

Admiral BENSON. They would while in the submarine zone; certainly.

Senator PITTMAN. The loss of every one of our major ships during this war would have weakened our permanent Navy, would it not?

Admiral BENSON. It would.

Senator PITTMAN. The General Board, as had you as Chief of Operations, had those things in mind, as every chief of operations of every other navy would have them in mind, did it not?

Admiral BENSON. Yes.

Senator PITTMAN. And as you testified, your first thought was for the protection of our own coast and the preservation of our own Navy?

Admiral BENSON. Absolutely, sir.

Senator PITTMAN. It is possible—it is even probable—that the British Admiralty would have been perfectly willing to have had our battleships bear the brunt of the fight in the North Sea. It is perfectly possible that the British Admiralty would have been perfectly willing that our battleships should have been risked in any danger zone. I do not think that is a reflection on either of those admiralties. But because they were willing for that to happen, I do not conceive that that is any reason why you should have been willing for it to happen.

The CHAIRMAN. Is that a question?

Senator PITTMAN. No; I am just asking it for a foundation for other questions.

I want to ask you whether or not you agree with what all agree to be Admiral Sims's position, that we should have sent over immediately on the beginning of the war all our available craft to the other side?

Admiral BENSON. I do not think we should, sir, for the reasons I have already stated. I did not think so at the time and I do not think so now; and as I have repeatedly stated, mine was the responsibility; I had to exercise my judgment; and my first thought in the beginning, during, and always, was to see first that our coasts and our own vessels and our own interests were safeguarded. Then when I was satisfied that that was done as far as I could, with what we had, then to give everything we had and to do everything we possibly could for the common cause.

Senator PITTMAN. Admiral, do you know of any delay on your part or on the part of the Secretary of the Navy, whether justifiable or not justifiable, in acting upon any recommendation of Admiral Sims that affected the duration of the war?

Admiral BENSON. I do not think in the slightest, Senator; and I do not think there were any delays that were material to the cause practically in any way, either by the Secretary or by myself.

Senator PITTMAN. Yes.

Admiral BENSON. In assuming responsibility as I did, and have, for the naval operations, I do not admit that there was any unnecessary delay or any improper compliance with the demands of the situation; but, on the contrary, I insist that the situation was met in

the most efficient and thorough manner and as far as possible and the facilities we had and the situation permitted.

Senator PITTMAN. That is all.

The CHAIRMAN. Admiral, after we entered the war did the British lose many major ships?

Admiral BENSON. I do not recall that they did, sir.

The CHAIRMAN. So that if we had sent our ships over there, there was no more reason to suppose that we would lose them than to suppose that the British would lose theirs, was there?

Admiral BENSON. I think there was, sir. The recommendation was to send these ships—the one I am referring to now, the division of our battleships—to Brest. They would have had to pass through the submarine zone, and they would have been exposed to the submarine danger there; and had they ever gone outside of Brest they would have gone immediately into the very thick of the submarine zone; and from the fact that they were there, greater efforts would have been made to attack them whenever they left the harbor. It would have taken a large number of destroyers to protect them whenever they moved, wherever they moved. It would have necessitated additional fuel and provisions; and in addition to the danger to which they were exposed, as I sized up the situation, and I believe correctly, they would not have served any good purpose, and we would have been injecting into the problem an element that was adding to its troubles rather than decreasing them.

The CHAIRMAN. You are referring to the suggestion of sending battleships over to Brest?

Admiral BENSON. That is, the older ones.

The CHAIRMAN. That was not especially a recommendation. That was simply a suggestion.

Admiral BENSON. Yes; I thought that—

The CHAIRMAN. Later on did not Admiral Sims recommend that some battleships be sent over to be used as they subsequently were used?

Admiral BENSON. With the Grand Fleet?

The CHAIRMAN. Yes.

Admiral BENSON. Yes, Mr. Chairman.

The CHAIRMAN. And those vessels, of course, would have been under the same danger that British battleships were?

Admiral BENSON. Yes.

The CHAIRMAN. And they were under the same danger and were not lost?

Admiral BENSON. Until they got within reach, where the Grand Fleet could protect them with their destroyers.

The CHAIRMAN. Yes; and they were not?

Admiral BENSON. They were not lost.

The CHAIRMAN. Was the policy of the department primarily to save ships; that is, not to put them in positions of danger, so that they might be saved, even though by putting them in positions of danger they were doing good?

Admiral BENSON. No, sir.

The CHAIRMAN. It was not?

Admiral BENSON. Decidedly not, unless the situation warranted it. For instance, when the German submarines appeared on this coast, I recommended, and the Secretary approved the policy, of not

stopping our transports, even with our troops on board, for a moment; and they were never held up for a period of a day, I do not think, on account of the presence of German submarines. No one in the Navy hesitated. On the contrary, we insisted that any vessels that we had and that were available should be utilized wherever their services were needed and they could be of benefit.

The CHAIRMAN. So that you would not say that your policy was primarily to look after the safety of the vessels of the Navy?

Admiral BENSON. Decidedly not, for its safety, except as I have already testified in safeguarding the interests of the battleship forces. That was one of my duties, sir. Not primarily.

The CHAIRMAN. If possible, in connection with their duties that they were performing, to make them as safe as possible in the performance of those duties?

Admiral BENSON. Yes.

The CHAIRMAN. Do you feel that it is a reflection on the Navy and 500,000 young men that served in it that persons who were ultimately responsible for the conduct and the policies of the Navy during the war had not in all respects done what they should have done?

Admiral BENSON. I think it would be; yes.

The CHAIRMAN. That is, a reflection on you or a reflection on the Secretary of the Navy would be a reflection on all these men?

Admiral BENSON. It would reflect on the whole service.

The CHAIRMAN. You do not make any difference between a reflection upon the Navy as a body of men and upon the Navy Department?

Admiral BENSON. I think the whole service would be included, sir. But I do not admit—and the statement is not borne out in fact—if it were a true statement and bore anything on its face that could be substantiated; and coming as it does, a statement of that kind I consider most decidedly—

The CHAIRMAN. That is because you do not think it was based on facts. Now, I say if it was based on facts, do you not think it is probably proper that it should be made?

Admiral BENSON. If it is based on facts, it should be made.

The CHAIRMAN. It should be made if it is based on facts?

Admiral BENSON. It should be made if it is based on facts.

The CHAIRMAN. Therefore, if any one had the opinion that the Secretary of the Navy or the Chief of Operations had not performed their duties as they should, it is essentially important that that fact should be brought out, is it not?

Admiral BENSON. If any such fact existed, it certainly should be brought out.

The CHAIRMAN. And in bringing it out, it is no reflection on the rest of the Navy?

Admiral BENSON. I think in a way the fact that anyone in the Navy had been negligent would reflect on the balance of the service.

The CHAIRMAN. Then you think that in order not to reflect on the service the actions of those responsible should be covered up?

Admiral BENSON. Certainly not.

The CHAIRMAN. Then, if it is not to be covered up, you do think it is perfectly proper that it should be brought out?

Admiral BENSON. Should be brought out, absolutely.

The CHAIRMAN. You have stated that you know of no case where there was any material delay either on your part or on the part of the Secretary of the Navy?

Admiral BENSON. Yes. Of course I mean during the war.

The CHAIRMAN. During the war?

Admiral BENSON. Yes.

The CHAIRMAN. You do not refer to the time immediately before the war?

Admiral BENSON. No; I can not refer to that.

The CHAIRMAN. Admiral Plunkett made the following statement in his testimony, on page 1293 of the typewritten record. [Reading:]

Up to 1915 we had been conducting battle exercises by opening the engagement by firing a single gun in order to get the approximate range of the enemy, followed by another gun after that shell had landed, some 20 second later, also with a view of getting the range, some correction being applied to that second shot, in other words a method of approximation. The question of range finding was then taken up seriously. Up to 1915 we had comparatively no efficient range finding instruments. Those are instruments of prime importance, and at the outbreak of the war we had only a sufficient number of them for our first lien ships. The ships in reserve had practically no range finders worth mentioning.

All those things, and the concentration on gunnery training brought home to us the fact that we were terribly undermanned, and it was those reports that Capt. Tausig speaks of here which flowed over my desk in volumes, which kept me pegging away at the Secretary of the Navy all the time asking for more men, and representing to him the fact that we needed men and officers.

Now, it may seem odd, when I was a subordinate officer, that I took those matters to the Secretary of the Navy; but I assure you that I took them there because the Chief of Naval Operations had exhausted all the talk he had in his system.

The CHAIRMAN. Who was the Chief of Naval Operations?

Admiral PLUNKETT. Admiral Benson. He said, "If you can get them, go and get them. I can not get them."

Does that indicate that there was some trouble or delay in getting what you asked for?

Admiral BENSON. Was not that before the war, Mr. Chairman? I have already testified that I did think we were short of personnel, and there was delay in providing it. I think I have stated that, that we were short of personnel; and that is a fact.

The CHAIRMAN. And you admit that there were delays before the war?

Admiral BENSON. Before the war, in providing proper personnel.

The CHAIRMAN. And you think that had a direct effect on the situation after we got into the war?

Admiral BENSON. Yes; to a certain extent it did, naturally.

The CHAIRMAN. You have spoken about the British naval officers who were constantly working with you in the department. Who were these British naval officers?

Admiral BENSON. There was Commodore Gaunt of the British Navy who was there pretty constantly. He had an assistant who was there pretty constantly. Later on Admiral de Chair was over here for awhile, Rear Admiral de Chair, who was over here with the commission; and then a little later on Admiral Grant of the Royal Navy was here permanently in Washington.

The CHAIRMAN. There was two British naval officers?

Admiral BENSON. In addition to those, there were other officers who came over here connected with the mine proposition. They, of course, only came into the office occasionally. It was a study proposition, in connection with mines, and so on.

The CHAIRMAN. Capt. Gaunt was the principal one of those two British officers, was he not?

Admiral BENSON. He was the principal one up to the time when Admiral Grant came. We suggested that in order to make the situation more complete—the cooperation more complete—here, that he then, instead of being at Bermuda or at Halifax as he had been before, come to Washington and make his permanent residence, practically, here in Washington.

The CHAIRMAN. What was his rank?

Admiral BENSON. He was an admiral.

The CHAIRMAN. Admiral Grant?

Admiral BENSON. Admiral Grant.

The CHAIRMAN. And Gaunt was a captain?

Admiral BENSON. He was a commodore.

The CHAIRMAN. A commodore?

Admiral BENSON. And he had commanded one of the ships in the North Sea force.

The CHAIRMAN. And he was the British naval attaché?

Admiral BENSON. He was the British naval attaché.

The CHAIRMAN. Was Admiral Grant the British naval attaché?

Admiral BENSON. No; he was representing the British naval forces on this side.

The CHAIRMAN. And he came over here when?

Admiral BENSON. I think in the latter part of 1917 or the early part of 1918. I would have to refer to the records to tell you that date. He was here in the summer of 1918.

The CHAIRMAN. At any rate, not during the first six months of the war?

Admiral BENSON. I do not think he was here during the first six months; no.

The CHAIRMAN. We had a naval attaché in Great Britain?

Admiral BENSON. Yes.

The CHAIRMAN. When Admiral Sims went over, did we not?

Admiral BENSON. We did.

The CHAIRMAN. Would you consider that he was as much the representative of the American Government as Admiral Sims at that time, so far as naval matters were concerned?

Admiral BENSON. Only in a very certain way. The situation developed very rapidly over there, Mr. Chairman, as you recollect. When Admiral Sims went over we were not then at war, and we were at war by the time he reached over there, and the situation developed very rapidly. For instance, the destroyers were sent over, had their orders, or we had decided to send them over before we got any cable, or before Admiral Sims had had time to answer, and possibly before he arrived. And then it was necessary to put him in command of the forces over there and give him general charge. The idea was that we should have an officer of higher rank, and Admiral Sims was selected to fill that position, and I considered that from the time he reached London until he left there he was our proper and our naval representative in London.

The CHAIRMAN. And he was the principal one on whom you depended?

Admiral BENSON. Yes.

The CHAIRMAN. Would you say that the information you received from the British naval attaché over here was in any way commensurate with the information that you received from Admiral Sims after he had begun to perform his duties on the other side?

Admiral BENSON. I think it was commensurate with it in a way, and in many things we got almost the same information, as I recall it, that we did, possibly in a different form from what we did from Admiral Sims; not in the great detail, and necessarily did not and could not refer to our own forces; but I mean of the general situation. Of course Admiral Sims was kept directly in touch.

The CHAIRMAN. Would you say that you would follow those recommendations as quickly as you would those of Admiral Sims?

Admiral BENSON. No; I do not, by any means. I mean that I would weigh both, though, very carefully.

The CHAIRMAN. In your testimony of yesterday you stated as follows: [Reading:]

The CHAIRMAN. Now, Admiral, you state that you were responsible for the policies that were carried out by the department during the war?

Admiral BENSON. Yes; that is regarding naval operations.

The CHAIRMAN. Were not those policies in regard to naval operations on the other side based largely, almost entirely, on the representations made to you by Admiral Sims?

Admiral BENSON. On the information that we got from there; yes.

The CHAIRMAN. And the recommendations?

Admiral BENSON. Yes; very largely on the recommendations.

Admiral BENSON. Yes. Might I modify that with reference to the operations? I understood you referred to the war zone, of course.

The CHAIRMAN. The operations in the war zone?

Admiral BENSON. Yes, sir. I would like to modify that statement, or make that addition to it, that the policies I acted upon from Sims's advice referred to operations in the war zone.

The CHAIRMAN. And it was principally on questions related to the war zone that you got your recommendations and information from Admiral Sims, was it not?

Admiral BENSON. Principally.

The CHAIRMAN. In making surveys, to which Senator Pittman has alluded, of production in this country and the material and so forth, did you not also make a survey of the personnel of the Navy?

Admiral BENSON. That was constantly under consideration.

The CHAIRMAN. Did you find it entirely satisfactory?

Admiral BENSON. I did not, sir.

The CHAIRMAN. The naval program that was adopted in 1916 was not a program adopted for immediate use in the war, was it, or in case we should go into war immediately? It was a future program?

Admiral BENSON. In 1916 it was for the general building up of the Navy for future use.

The CHAIRMAN. And it would not have been possible to get that program in operation for a number of years?

Admiral BENSON. I think three years was the term, sir.

The CHAIRMAN. Three years was the term; therefore it would not have been possible to get it into operation before that time?

Admiral BENSON. Not all of it; no, sir.

The CHAIRMAN. Nor very much of it, would it?

Admiral BENSON. Well, I think the destroyers and submarines that were appropriated for might have been in about a year and a

half or two years; we counted on them. Eighteen months or two years, I think, we counted on getting destroyers and submarines.

The CHAIRMAN. Therefore you think we should have gone to work at once on that part of the program?

Admiral BENSON. I think we did go to work at once, as far as the conditions would permit, on all of it. There were about 156 vessels, as I remember, we finally concluded on in that program, and the number that could be built at once, according to the bill; I feel that work was begun just as quickly as it was possible to get plans and other things in readiness for that, and contracts to be placed.

The CHAIRMAN. But it was not critical work that was being done for an immediate emergency?

Admiral BENSON. No; it was not for an immediate emergency.

The CHAIRMAN. How many of the destroyers that you had in that program took part in the war?

Admiral BENSON. I think possibly most of them. I could not say, sir.

The CHAIRMAN. Most of the destroyers provided for in that program took part in the war?

Admiral BENSON. I believe they did; but I could not state that without reference to the records. That is a detail that I can not carry.

The CHAIRMAN. You stated, I think, that if we had withdrawn our forces previously, at the beginning of the war, from this side, and had sent them over to the other side, it would have induced Germany to send her submarines over here?

Admiral BENSON. I believe it would.

The CHAIRMAN. At that time?

Admiral BENSON. I believe so.

The CHAIRMAN. Do you not believe if she had sent her submarines over here, it would have caused considerable further delay in sending forces over to the other side?

Admiral BENSON. I think that would have depended upon the development of the situation.

The CHAIRMAN. Do you not think that if 3 or 4 submarines had come off our coast, it would have been very difficult to send any forces to the other side?

Admiral BENSON. I say that would have depended upon the development of the situation, how successful they were and what vessels we had for sending to the other side.

The CHAIRMAN. She did not do so?

Admiral BENSON. She did not.

The CHAIRMAN. The fact that she did not do so rather bore out the recommendations, did it not?

Admiral BENSON. I think it bore out my viewpoint, that we immediately tried to be prepared for their arrival; and they, knowing that, did not send them.

The CHAIRMAN. You think that the preparation we had on this side was what kept them from sending them?

Admiral BENSON. I do.

The CHAIRMAN. You do not think they could have sent them over here to menace our seacoast and keep us from sending vessels over to the other side?

Admiral BENSON. I think they could have sent them over here to menace our seacoast, and have done a tremendous amount of damage.

The CHAIRMAN. Do you not think they would have been warranted in sending submarines over, and that it would have been good policy for them to do so?

Admiral BENSON. I think they would have been warranted in doing it, and it would have been good policy.

The CHAIRMAN. You think they would have been warranted?

Admiral BENSON. I think so.

The CHAIRMAN. You think they would have delayed us, and that it was a mistake that they did not send them?

Admiral BENSON. I think it was a mistake.

The CHAIRMAN. And you think that the fact that they did not send them over——

Admiral BENSON. I have never been able to account for it.

The CHAIRMAN. You have never been able to account for that?

Admiral BENSON. No, sir.

The CHAIRMAN. But that rather bore out the plans made on the other side, did it not?

Admiral BENSON. You always have one chance out of two, Mr. Chairman, to be right. When you make a prediction you are either right or wrong. But I had to act on my judgment; I could not take chances; I had to view the situation and act according to my judgment, and my natural inclination and my duty, as I saw it, was to safeguard American interests, and I did that; and whether I was right or wrong, I should do the same thing again.

The CHAIRMAN. But you think it was more important to keep them away from this coast than it was to go over and put down the menace on the other side?

Admiral BENSON. If we could have been sure that we could prevent their coming over here, and made it impossible for them to come, then of course that would have been the right thing to do.

The CHAIRMAN. Do you not think it was as important to feed our troops over on the other side, to supply them with food, as it was to get them there?

Admiral BENSON. One was as necessary as the other.

The CHAIRMAN. Do you not feel that our contribution to putting down the submarine menace helped greatly toward so feeding the troops that we got there?

Admiral BENSON. We fed them, Mr. Chairman. I can only give results as the evidence of what happened.

The CHAIRMAN. And you feel that our contribution to putting down the submarine menace did directly contribute to that, do you not?

Admiral BENSON. I think it helped the situation. As I said yesterday, what we did was of material assistance.

The CHAIRMAN. You stated that our part in finishing the war was done by the troops on the other side.

Admiral BENSON. That was the final contributing force, in my opinion, yes, Mr. Chairman.

The CHAIRMAN. That was the main thing that was done by this country, was it not?

Admiral BENSON. No; of course they could not have done that if the Navy had not gotten them over there.

The CHAIRMAN. And you stated yesterday that the Navy got over about 900,000?

Admiral BENSON. I made it about 900,000; and we brought back practically all of them.

The CHAIRMAN. And in getting them over what ships did we use?

Admiral BENSON. That was very largely the ex-German ships.

The CHAIRMAN. That is the transports?

Admiral BENSON. The transports.

The CHAIRMAN. And in guarding those transports what did you use?

Admiral BENSON. In guarding those ships we used the cruisers and destroyers and gunboats.

The CHAIRMAN. Very many cruisers?

Admiral BENSON. We used practically all we had, finally.

The CHAIRMAN. Did you use armored cruisers?

Admiral BENSON. We used the armored cruisers, yes, sir.

The CHAIRMAN. Did we use them during the first six months of the war?

Admiral BENSON. I do not think they were used during the first six months of the war.

The CHAIRMAN. Did we use any cruisers of any sort during the first six months of the war?

Admiral BENSON. I said transports. I think we did, yes, with the transports, and of course transports were always taken; and they were accompanied by destroyers.

The CHAIRMAN. Did we use many destroyers for that service?

Admiral BENSON. As many as we had. I forget how many we had. We had about 50, altogether.

The CHAIRMAN. We used as many as we had? You do not mean to say we used all our destroyers for that?

Admiral BENSON. No; we sent over a number during the first months to the other side.

The CHAIRMAN. And for escorting those troop ships we used very few, did we not?

Admiral BENSON. We used few destroyers.

The CHAIRMAN. And you would say, therefore, that the protection of our coast and the limited use of our Navy in protecting these troops that went over was the principal work that was done by the Navy during the war?

Admiral BENSON. No, sir; I do not say that either. I say that the whole problem of getting the troops over, getting the ships over, helped out in the submarine zone, as with the escorting of not only our own ships but British ships, and we had a very large patrol force on the coast, or a fairly large patrol force on the coast of France, and in Gibraltar, and later on in the Adriatic.

The CHAIRMAN. But were not the major part of the activities of the Navy during the war taken up with putting down the submarine menace?

Admiral BENSON. I do not think so. I think the major part of the Navy was getting our troops and munitions and supplies over there.

The CHAIRMAN. I know, but you have already testified that there were not very many ships used in connection with that.

Admiral BENSON. We used our destroyers and cruisers.

The CHAIRMAN. A few destroyers?

Admiral BENSON. Yes; to the limit that we could, because our destroyers were being used in the submarine zone on the other side. For instance, we sent destroyers from this side, and they were met. For instance, we maintained a fuel-oil ship in the mid-Atlantic, and destroyers went over there, and in order to use them to the maximum they refueled and came back. And we manned all of the troop transports. We manned practically every vessel. As soon as the operation got to going well we manned and controlled and operated all of the vessels that were used by the Army for munitions.

The CHAIRMAN. That is, you put some men on these merchant ships?

Admiral BENSON. Every one of them we manned throughout absolutely, until we were ultimately operating nearly 450 merchant ships in my office, in addition to the naval force.

The CHAIRMAN. That is, the personnel of the Navy was taken from the fighting ships and put on these merchant ships?

Admiral BENSON. No; but—

The CHAIRMAN. To a large extent?

Admiral BENSON. But we took men from the reserves, and, as I have stated, sometimes we took the captain and the entire crew and officers, when they suited the purpose, when we took a vessel, and they then became a part of the Navy, and we operated them as a part of the Navy, and that was all operated from my office.

The CHAIRMAN. You have talked about reflection on the Navy in criticizing what you did or what the Secretary of the Navy did. It seems to me it is a reflection on the men who fought in the anti-submarine warfare that we had over there to belittle or minimize the part that they took in the war. It seems to me that they did very good service; very great and very useful service.

Admiral BENSON. I do not understand you, Mr. Chairman.

The CHAIRMAN. I am explaining. They did very excellent and useful service during the war, and to say that the work that they did did not contribute in any way toward shortening the war, I think is rather a reflection on them, don't you?

Admiral BENSON. I do not consider that any evidence I have given or any remarks I have made in any way can possibly be construed into criticism of the force we had over there. If I have made any such impression I most earnestly—

The CHAIRMAN. I do not think you are criticizing what they did.

Senator PITTMAN. Will you not please let the witness finish his answer, Mr. Chairman?

Admiral BENSON (continuing). I most earnestly protest that I have not by word or implication intended in any way to belittle what our troops or our men did over there in that service.

The CHAIRMAN. All right.

Admiral BENSON. I can not too strongly emphasize, Mr. Chairman, that there was never a thought entered my mind of that, and I can not understand that anything I have said could possibly be construed in that direction at all. If so, I most earnestly protest that it was never my intention to do so.

The CHAIRMAN. I do not think you have criticized the performance of their work, but you do lay stress on the fact that the work they did had nothing to do with shortening the war.

Admiral BENSON. I do not believe that it did.

The CHAIRMAN. Precisely.

Admiral BENSON. But it helped the situation. I have stated more than once that I thought it materially helped the situation, and it kept up the morale of the Allies in doing the tremendous work they did, and it undoubtedly did help to save our own troopships and supply ships as they went through the danger zone. It helped in a thousand and one ways to get them there. And I did not suppose that that fine distinction would be made between the two cases, and that the work in their special case would be differentiated from the general results of the whole thing. I did not anticipate that that fine distinction would be made, and I did not intend that it should be made in my evidence.

The CHAIRMAN. But if it helped to sustain the morale of the Allies and helped to supply the Army and the Allies themselves, I can not see why it did not help to shorten the war.

Admiral BENSON. I helped in that bearing. It helped only to get our troops over there, I said; and I repeat and insist that the work in the final shortening of the war, as far as the United States was concerned, was in getting the troops into France, and finally the formation of the American Army under Gen. Pershing, and that anything that contributed to that result helped in the final ending of the war.

The CHAIRMAN. That is, helped to shorten the war?

Admiral BENSON. Helped to shorten the war, and now I do not think that that is in any way inconsistent with any evidence I have given; and if so, I would like the matter cleared up.

The CHAIRMAN. How are you going to clear it up? You do admit that it helped to shorten the war?

Admiral BENSON. They helped to shorten the war. By helping the morale they helped the general situation.

The CHAIRMAN. They did, then, help shorten the war?

Admiral BENSON. By getting the troops over.

The CHAIRMAN. Then it is only a matter of opinion as to how much they helped to shorten the war, is it not?

Admiral BENSON. It must necessarily be a matter of opinion—the whole thing. I am giving my opinion as nearly as I can, in the whole matter.

The CHAIRMAN. And others have given their opinions?

Admiral BENSON. Yes.

The CHAIRMAN. For instance, Admiral Sims thinks that it helped to shorten the war four months. Now, you think that it helped to shorten the war. How much did it help to shorten the war? That is simply a matter of your opinion.

Admiral BENSON. I must repeat what I have said, sir, that it only helped in so far as it contributed in the way that I have stated. That is my opinion, that it did. It may not have helped it at all. It could have been possible for us to have gotten our troops over there with the protection we gave them. Of course, the protection in the submarine zone was given by the forces we had over there, by the destroyers we had over there, and it might have been that from any other cause, that the effort we made might not have helped at all; but I believe it did help. But it is very difficult for me—I am trying to give you, Mr. Chairman, a straight, honest answer to your ques-

tions, and I can not quite appreciate the keen differentiation in regard to my replies. I want to be perfectly frank and straightforward in my replies, and I do not exactly understand the situation.

The CHAIRMAN. Why, Admiral, if the work done by these men did not help to shorten the war, then it seems to me their work was in vain. If, on the other hand, it did help to shorten the war, it is up to anyone to have an opinion as to how much it helped to shorten the war; and Admiral Sims stated that it shortened the war four months.

Admiral BENSON. I do not agree to that.

Senator PITTMAN. Pardon me; wait a minute, Mr. Chairman. I object to that statement as being not founded on the evidence. Admiral Sims did not say that it shortened the war four months. He said the inefficiency lengthened the war four months.

The CHAIRMAN. Well, that is a rather subtle distinction.

Senator PITTMAN. It is not subtle, at all.

The CHAIRMAN. I do not recall exactly what he said; but at any rate, he said that it made a difference of four months in shortening the war.

Senator PITTMAN. He said that it lengthened the war four months, and that during that four months they lost 500,000 lives. There is quite a distinction.

The CHAIRMAN. Exactly, because during that four months 500,000 lives were lost.

I think you see the distinction now, do you not, Admiral?

Admiral BENSON. I am perfectly willing to admit my stupidity, Mr. Chairman, but I can not—

The CHAIRMAN. Well, Admiral, if it did help to shorten the war, it helped to shorten it a certain length of time. You may not know how long, but it shortened it a certain length of time?

Admiral BENSON. It contributed to the general cause. I believe that it did, to a certain extent, because there are so many things that enter into the situation, Mr. Chairman, that it is impossible for me to give a more definite reply than that.

The CHAIRMAN. Then, if it shortened the war a certain length of time, you might have one opinion about what that length of time was, and another man might have another opinion, might he not?

Admiral BENSON. Absolutely; I can answer that.

The CHAIRMAN. Now, you have stated that even allowing for a loss of 800,000 tons a month—and that is the amount that was lost in April, 1917—the Allies could have held on until the end of the war or until the matter was brought to a military decision. I take it that the matter would not have been brought any sooner to a military decision, would it, under those circumstances?

Admiral BENSON. What I feel is, sir, that with the supplies they had on hand and the way the thing was going, and the way the situation was being developed, they could have held on until a final decision was reached—that is, after we got into it.

The CHAIRMAN. The armistice was signed—

Admiral BENSON. November 11, 1918.

The CHAIRMAN. And we went into the war on April 6, 1917?

Admiral BENSON. Yes.

The CHAIRMAN. And during the month of April, 1917, 800,000 tons of shipping were lost. That is 20 months, is it not, or a little over 19 months?

Admiral BENSON. It is a little over 19 months; a few days over 19 months.

The CHAIRMAN. That would involve, during those 19 months, the loss of something over 15,000,000 tons of shipping, would it not?

Admiral BENSON. I take your figures as being correct, sir.

The CHAIRMAN. I think that is right. And you think that the Allies could have lost that amount of shipping in that time and still have kept on in the war?

Admiral BENSON. You will have to remember, Mr. Chairman, that shipping was being constructed very rapidly at that time, and the curves of destruction and production were going, so that while we might never build as rapidly as they were being destroyed, we were increasing the building very rapidly, and shipping was being constructed; and I still feel that the——

The CHAIRMAN. What was the amount of shipping that was constructed during that time, that was put in operation?

Admiral BENSON. I could not say without reference to actual records, sir; but I do remember, in a general way, that it was being built very rapidly.

The CHAIRMAN. Was it more than 3,000,000 or 4,000,000 tons during that whole time?

Admiral BENSON. I could not say.

The CHAIRMAN. Most of it was during the latter part of that time, was it not?

Admiral BENSON. They were building it. Just at what time and how much I could not say without reference to the records.

The CHAIRMAN. Then you do not agree with Mr. Hoover's statement about the criticalness of the situation, or with Admiral Sims's testimony about that?

Admiral BENSON. I think it was critical, as I have already stated, but I do not think it was absolutely vital, or would have resulted in the ending of the war.

The CHAIRMAN. It could not have been very critical if we could have taken the figures during the month when the most shipping was sunk, and could still have kept on until the end of the war. However, you are willing to go on record as saying that?

Admiral BENSON. I am willing to go on record with my evidence, absolutely, sir.

The CHAIRMAN. On the 1st of May, 1917, Admiral Sims sent the following cable to the Navy Department. [Reading:]

Sent: May 1, 1917.

To: Secretary of the Navy.

British Admiralty has decided to give trial to the convoy scheme described in my last dispatch. Instead of present plan of naval forces operating independently against raiders, there will be a high-sea convoy against raiders, such convoy to be established as quickly as possible on all main trade routes, and on approach to dangerous areas on this side, will be met by destroyers and escorted into port. Hampton Roads and New York have been proposed as assembly ports for eastbound vessels on our coast and Gulf, with convoys sailing every fourth day. Plan decided on after long consideration by Admiralty and war council, and is considered absolutely necessary. It will strain British resources of personnel and ships to the limit, and we must assist by taking one route, at least, if the plan is to be carried out. Admiralty desire to be informed whether we can provide escorts for convoys sailing from the rendezvous at New York. British estimate about 14 ships will be required for New York service, and larger numbers for other routes, including Mediterranean and South America. Escorts should have sustained sea speed of at least 12 knots, and 6-inch guns. I very

urgently recommend favorable action. Through British naval representative at Washington details of plan will be communicated from time to time, as necessary
Sims.

The CHAIRMAN. So that you received distinct notice on May 1 that the British had decided to take up the convoy plan, and were asking for our cooperation?

Admiral BENSON. We received that message. I would like at this stage to invite the attention of the committee and the chairman to this fact. The character of the questions put to me a little earlier in the hearing seemed to me to indicate that Admiral Sims was responsible for all policies. I wish to invite attention to the fact that that message clearly indicates that he got all of his information and his ideas as to what should be done from the British Admiralty; and as I stated before, he simply transmitted them to us in the Navy Department.

The CHAIRMAN. I think the British Admiralty consulted with him in making up all plans, so far as we were concerned, did they not?

Admiral BENSON. I think he consulted with them and got their ideas, sir. To answer your question directly, now, we did have that message.

The CHAIRMAN. That makes it all the more authoritative, does it not?

Admiral BENSON. Coming from the British Admiralty?

The CHAIRMAN. Coming directly from the British Admiralty, through Admiral Sims?

Admiral BENSON. Yes; but I want to emphasize the fact that Admiral Sims was simply the means of the information that came to us from the British, except what we got from other sources.

Senator PITTMAN. Was I correct in hearing it stated in the letter that they decided it after a long conference?

The CHAIRMAN. I think that is in the letter, that it had been decided on after a long conference with the war council.

Senator PITTMAN. About three years, was it not?

The CHAIRMAN. I do not know the length of time; but at any rate they had reached their results, after watching the operation of the submarine; and at least I should think that might be of some value to us, to get the results they had on it, reached by them, was it not, Admiral?

Admiral BENSON. It was of value; and if I mistake not, I think we got into the convoy almost as soon as the British did. But, as I said yesterday or at some time in my hearing, it was a very serious policy to be adopted, and I do not think any right-minded American could settle down quietly and accept his instructions practically from the British Admiralty. I, for one, am not willing to do it.

The CHAIRMAN. Did not our going in have anything to do with the British taking up that plan?

Admiral BENSON. Did not our going in?

The CHAIRMAN. Did not our going in and helping them have something to do with their taking up that plan?

Admiral BENSON. I think they tried it before they accepted it.

The CHAIRMAN. They tried it?

Admiral BENSON. I think they did.

The CHAIRMAN. But were not the plans for adopting the convoy system based largely on our cooperation with them?

Admiral BENSON. I so understand from that message; and as I stated yesterday in my hearing, I think their first convoy left Gibraltar about the 1st of May; I think about that time it was sent.

The CHAIRMAN. Showing that it was in operation?

Admiral BENSON. That they were trying it; going at it and preparing for it. It was good judgment on our part to watch them until they did try it, I think.

The CHAIRMAN. But it was at a very critical time?

Admiral BENSON. It was at a critical period of operations.

The CHAIRMAN. Did you not state that you thought the work done by the Chief of Operations was of more importance than that of any one on the other side?

Admiral BENSON. I do not think there is any comparison, sir.

The CHAIRMAN. You think that it was of more importance?

Admiral BENSON. I think it was decidedly more important.

The CHAIRMAN. And you think, in general, that the work done by the Chief of Operations, or whatever he may be called, in any service, is of more importance than the work done by the commander in the field?

Admiral BENSON. That does not follow, sir; but I think it is always of vital importance, and I think in this case, as I say, there was no comparison between my position and the one that Admiral Sims held.

The CHAIRMAN. You think there is no comparison between them, and in every respect your position—

Admiral BENSON. I beg your pardon, sir?

The CHAIRMAN. I say you think in every respect your position was more important than that of Admiral Sims, in the war?

Admiral BENSON. Absolutely; no comparison between them. Admiral Sims was not practically in the field.

The CHAIRMAN. He was in command, however, of our forces?

Admiral BENSON. Yes.

The CHAIRMAN. That went in the field, was he not?

Admiral BENSON. Yes; well, that portion of it.

The CHAIRMAN. The testimony yesterday quoted Admiral Wilson's testimony. [Reading:]

I have no hesitation in saying that no nation upon the approach of war has had a force of battleships more nearly prepared for battle than was the force to which I was attached and which spent the winter of 1916-17 in southern waters; and I feel sure that if this force had engaged an enemy on its cruise north in the spring of 1917, the victory would have been ours.

That refers, does it not, to the condition of the battleships themselves and not to the fleet?

Admiral BENSON. I think it refers to the battleships themselves, and the highly trained condition of the personnel on board of them, or that they had at the time.

The CHAIRMAN. Of the battleships themselves?

Admiral BENSON. Of the battleships themselves.

The CHAIRMAN. At that time we were not at war. Therefore "an enemy" would refer to any nation, would it not?

Admiral BENSON. I so take it—a general term.

The CHAIRMAN. Then, do you think that Admiral Wilson would have been justified in saying if this force had engaged the British fleet on its cruise north, in the spring of 1917, that the victory would have been ours?

Admiral BENSON. I do think he would have been justified in making that statement.

The CHAIRMAN. Do you think he would have been justified in saying we could have met the German fleet at that time and the victory would have been ours?

Admiral BENSON. I doubt it.

The CHAIRMAN. Then you would not agree with the statement made by Admiral Wilson?

Admiral BENSON. Hypothetically, no.

The CHAIRMAN. Would you in any way agree with it?

Admiral BENSON. Well, it would have been touch and go with the German fleet, where you met them, Mr. Chairman, and how many of their small craft and destroyers and other vessels they had with them. If you met the whole fleet, of course the fleet as coming north with Admiral Mayo would not have successfully met them.

The CHAIRMAN. Do you think that the Germans would have simply gone out with battleships and a proportionate number of destroyers such as we had?

Admiral BENSON. I do not think they would; but they had a long distance to travel there, and their destroyers, I do not think, were very long-legged ones.

The CHAIRMAN. But you do not think they would have left behind their screening vessels?

Admiral BENSON. I do not think they would have gone out and made the attempt, if you get it right down to a fact.

The CHAIRMAN. Yes, but if we had met "an enemy?" That opens up the field to any nation.

Admiral BENSON. That opens up the field to any amount of conjecture; and I have to make the conjecture, if they had been there with all their destroyers and auxiliaries, and met that force; and the chances are most decidedly that they would have been successful against our ships.

The CHAIRMAN. Would you say that for an engagement in mid-Atlantic, the nation that had adequate screening forces, such as cruisers and battle cruisers and submarines and destroyers, would not be better off than the nation that had simply battleships and a few destroyers?

Admiral BENSON. Why, absolutely, Mr. Chairman.

The CHAIRMAN. Therefore they could bring those screening vessels out to mid-ocean, could they not?

Admiral BENSON. They could have brought some of them. They could even have towed their destroyers. They could have resorted to a good many devices. They could have fueled them in mid-ocean and resorted to many things and gotten them in that situation. The situation could have been made.

The CHAIRMAN. Could have been made, how do you mean?

Admiral BENSON. They could have gotten all their forces out in mid-ocean. That is not an impossibility.

The CHAIRMAN. Therefore the Navy with the screening vessels would have been in a better position than the Navy without them?

Admiral BENSON. Absolutely; there can be no question about it.

The CHAIRMAN. In the quotation that Senator Pittman yesterday took from Admiral Mayo's testimony, he gave the following paragraph [reading]:

When the active fleet arrived in Hampton Roads about the first of April after its training period in Cuban waters, it was in the best state of preparedness that it had ever been, and there was a feeling of confidence in the personnel of being able to cope with any emergency. The personnel was, however, on a peace basis, and the transfer of trained personnel for armed guard and other duty was already being felt in a decrease in efficiency. The destroyers that were first despatched to the war zone, though they were assigned to operations for which they had not been specially trained, showed the effect of their general training by the efficiency with which they at once entered into their new duties.

The next paragraph I think should also be added. [Reading:]

However, it should be pointed out that this fleet was lacking in the types of vessels essential to efficiency, such as battle cruisers, scout cruisers, light cruisers, and fleet submarines, and, furthermore, there are none even now available.

I think that should be taken in connection with the preparedness of the fleet as such.

On page 4585 of the testimony you stated [reading]:

Admiral BENSON. The only other thing that I can recall was that when I went to London in 1917, and before I left this side, there was a feeling that through some influence or other Admiral Sims was being persuaded to give too much attention to British shipping, and that our destroyers were being used too much for that and too little for our own vessels.

To what did you refer in that statement?

Admiral BENSON. I meant that there was a feeling—and I think I also added that I did not say whether it was correct or not.

The CHAIRMAN. Yes, you stated further along [reading]:

I do not mean to say that that feeling was justified, but I knew that it existed, and when I went to London, etc.

Admiral BENSON. Yes; there was a feeling over here that better security might be given to our ships in the submarine zone, and that Admiral Sims was too much impressed with the necessity or desirability of safeguarding British shipping—their ships, etc.

The CHAIRMAN. Our shipping at that time was not very large as compared with theirs?

Admiral BENSON. Not very large, Mr. Chairman; and I am not responsible for the feeling. I recognized that there was the feeling, and, as I stated yesterday, my friendship for Admiral Sims led me to warn him that that feeling was growing up. I did not say that it was justified and did not charge him with it, but I referred to that on the other occasion when I spoke to him about the situation.

The CHAIRMAN. Then you do feel he was perfectly justified in looking after the greater British shipping and not specifically looking after the American shipping?

Admiral BENSON. As far as I was informed I felt that Admiral Sims was performing his duties satisfactorily, and I can not put it any more definitely than that; and, as I stated yesterday, that applies, to the best of my knowledge and belief, both here and everywhere else.

The CHAIRMAN. In the statement made about the excellence of the gunnery of the Navy; the statement made by Admiral Plunkett, do you consider that that excellence in gunnery continued after the men had been taken off the ships to be used as armed guards on merchant vessels?

Admiral BENSON. Not to the same extent, no; it did not. It did not exist. Because many of those men had to be taken off in order to have good marksmen on those ships.

The CHAIRMAN. That did decrease the excellence of the gunnery of the vessels of the Navy?

Admiral BENSON. Yes; it did decrease the excellence of the gunnery of those vessels.

Senator PITTMAN. But it did increase the protection of the ships to which they were sent?

Admiral BENSON. It was the only way, or the best way, in which we could assist the general cause.

The CHAIRMAN. I think in Admiral Fletcher's testimony, as quoted yesterday, the statement was made that at the entrance of our country into the war, we were as well prepared as any country in the world at the outbreak of the Great War in 1914, and you did not agree fully with that statement?

Admiral BENSON. As well as I can recall it, my statement was that with what we had we were quite as well prepared as any other nation except possibly Germany; Germany, knowing that she was going into war or expecting to, I believe that she was better prepared.

The CHAIRMAN. And you stated also that in regard to personnel we were not prepared?

Admiral BENSON. There was a shortage of personnel. Well, I include that in what we had. For instance, our personnel that we had was trained to the highest pitch.

The CHAIRMAN. Would you say that the circumstances were similar? The World War had been going on for substantially three years when we entered the war.

Admiral BENSON. Yes.

The CHAIRMAN. You have testified that according to your professional opinion there was grave danger of our getting into the war?

Admiral BENSON. Yes.

The CHAIRMAN. We had been following the war and had learned lessons, presumably, from what was being done in the war. Would you say that with the immediate prospect of getting into it any time, that was a prospect in any way similar to the situation of the nations back in 1914 when this war was sprung on them without any notice, or practically with no notice?

Admiral BENSON. You want my opinion on that situation, do you, Mr. Chairman?

The CHAIRMAN. Yes.

Admiral BENSON. Well, I would state it in this way. For many years Great Britain and Germany had been facing each other across the North Sea. They had shifted their bases entirely from the Channel to the North Sea, and built up their naval stations there. They had had two or three little tilts in previous years that clearly foretold what was coming. They had their minds made up, and I do not know but what they had quite as much definite warning as to their getting into the war as we did.

The CHAIRMAN. You think the possibility of war between Germany and England at that time was as imminent as the possibility of our getting into this war in 1917?

Admiral BENSON. Hardly as imminent; but it was imminent. It should have necessitated more careful and greater preparation. That has been clearly shown. I am simply stating the problem in general terms. It is more or less hypothetical anyway. I can not get down

to any more close definiteness than that. Of course, after the 1st of January, 1917, things began to thicken very decidedly.

The CHAIRMAN. And you do not think that three years after the war that had been going on, with the possibility that there was of our getting in at any time without any notice whatever, that should have forced us to do something in the nature of preparation much more than the conditions in Europe prior to 1914 should have forced them to do the same?

Admiral BENSON. I think, from my professional viewpoint, that we ought to have done a great deal more than we did to prepare for war. I think I have already stated that, from my professional viewpoint.

I also think that Great Britain should have been very much better prepared than she was—tremendously much better prepared—when she went into the war; but I suppose that they were carrying out the policy of their people, just as we were.

The CHAIRMAN. This memorandum that was put into the record yesterday of February 4 from Admiral Badger to the Secretary of the Navy was that the plan that has been referred to a number of times in this investigation as having been lost?

Admiral BENSON. No, sir; I do not think so. I think that was February, 1917, the one that was lost.

The CHAIRMAN. What became of this plan?

Admiral BENSON. Seventeen, do you mean?

The CHAIRMAN. No; this plan.

Admiral BENSON. Those reports were all sent to the department, and I think it is stated there in each case the action taken. I was a member of the General Board, and after Admiral Dewey's death, I became the presiding member of it.

The CHAIRMAN. As I recall it, there was no—

Admiral BENSON. Well, they were acted on; so far as circumstances would permit, the record shows—

The CHAIRMAN. As I remember, there is no approval by the department of this plan. The testimony bears that out. On the other cases there was a direct approval by the department. There was no approval specifically.

Admiral BENSON. Whether it was approved specifically or not I will not say—

The CHAIRMAN. It was not acted on—

Senator PITTMAN. Let him finish his answer, Mr. Chairman.

The CHAIRMAN. I think that I am doing this in the proper manner.

Senator PITTMAN. Well, I object, that it is not the proper manner to interrupt the witness in the midst of an answer.

The CHAIRMAN. Were the recommendations made in this report followed?

Admiral BENSON. I believe they were, as far as the conditions would warrant.

The CHAIRMAN. That, of course, would cover a large field, would it not?

Admiral BENSON. Yes.

The CHAIRMAN. For instance, there was the recommendation to increase the enlisted force to 150,000 men, and the marines to 30,000.

Admiral BENSON. That was not carried out, I am quite sure.

The CHAIRMAN. This plan was submitted on February 4. How soon thereafter was an increase recommended by the Secretary in the enlisted personnel?

Admiral BENSON. I think in March of 1917 the President authorized the increase of the personnel up to 87,000, and the formation of a Naval Reserve. I think that was in March, 1917.

The CHAIRMAN. March 20, was it not?

Admiral BENSON. I do not remember the date; but I assume, though I could not state from memory that the Secretary must have recommended that to the President. Otherwise he would not have done it.

The CHAIRMAN. And the personnel was not increased to the amount recommended in this plan?

Admiral BENSON. I do not think it was, Mr. Chairman. Eighty-seven thousand was the limit, I think, set by Congress of the regular force.

The CHAIRMAN. Have you any knowledge that this was used as one of the plans of the department?

Admiral BENSON. As you understand plans, I think it was.

The CHAIRMAN. You think it was?

Admiral BENSON. Yes; that is not a plan. That is a report. It was carried out. I would like to state here, if I may, Mr. Chairman, that the points that have been brought into this discussion or report in regard to the principles of Mahan, and the question of plans, of course Mahan was writing general principles for ordinary war. Mahan also says a great deal about cooperating with allies which has not been brought in, and I am not prepared to bring it in. But this war was a very unusual one, the conditions were very unusual. It was a condition and not a theory that we were facing, and we had to meet it as rapidly and as efficiently as we could with what we had, and I want to state also that I was one who determined on the policies to be developed and carried out, and gave them to my subordinates. I hope that the impression has not been made here, because I have not been able to remember in detail a lot of these things, that there was ever any question as to who was at the head of the office of Operations, or who initiated and developed, or rather announced, policies that they were to follow, and left to my subordinates to develop.

I believe I said yesterday that I had confidence in them to develop the plans necessary for their execution, because they were properly carried out and executed.

The CHAIRMAN. You would not say that these recommendations were followed?

Admiral BENSON. Only so far as the situation warranted. I believe that to be absolutely true. I can not go beyond that.

The CHAIRMAN. Until specifically approved, such a recommendation or plan would not become a plan?

Admiral BENSON. Yes; often, Mr. Chairman. As I say, I was a member of the General Board, and there were a good many of those things as well as many others that I carried out, without reference to the Secretary, and then informed him—tried to keep him informed. I felt that the Secretary had confidence in me, and I told him I would go ahead and try to keep him informed as well as I could; but I frequently did things without reference to the Secretary, and then informed him afterwards of what I had done.

The CHAIRMAN. Did you approve this plan?

Admiral BENSON. To the best of my knowledge and belief, I did.

The CHAIRMAN. In the report dated March 6, 1917, there was a recommendation as follows [reading:]

(d) There is no doubt that, if desired by the Allies, sending immediately a number of destroyers to cooperate with the allied forces in the barred zones would greatly add to the moral effect, at home and abroad, of the participation of the United States in the war.

That indicates that the General Board considered the moral effect of sending vessels over there as great, does it not?

Admiral BENSON. Yes, sir; it does.

The CHAIRMAN. Have you anything else, Senator Pittman?

Senator PITTMAN. No.

The CHAIRMAN. I think that is all, Admiral.

Admiral BENSON. May I state to the committee that I feel I owe it to myself to reiterate the fact that in asking for Admiral McKean and Capt. Pratt to come here and give the committee the details, in view of the other important duties that I was performing, I did not prepare myself to answer many of these detailed questions that have been put to me, and my memory is such that it is impossible for me to do it. I simply refer the whole matter to the record and to what was accomplished in the war.

I also want to state that in regard to any answers I have made to any questions here, they have been of such a nature that it was a little difficult for me always to get at just the meaning, but they have all been answered to the best of my knowledge and belief; and I further want to emphasize the fact that I was in charge of the Office of Operations, and that while my subordinates were able and efficient, loyal and energetic, they simply carried out my policies and my ideas, for which I am the responsible head.

There is another thing. I find on consulting the record that I stated that I did not think that the Secretary of the Navy had given any orders about preparation. I noticed in one of the reports or letters that Senator Pittman quoted, he did give such an order, and I would like to correct that, so that by no means could I reflect in any way on the failure of the Secretary of the Navy.

The CHAIRMAN. You know of no other case, however, where he did?

Admiral BENSON. I can not recall, now; but I would just like to make that general statement.

The CHAIRMAN. You may be excused now, Admiral, and the committee will stand adjourned until Monday morning.

(Thereupon, at 1 o'clock p. m., the subcommittee adjourned until Monday, May 10, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

MONDAY, MAY 10, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE
COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, and Trammell.

The CHAIRMAN. The committee will come to order. Secretary Daniels, have you a statement to make in connection with the matters involved in this investigation?

Secretary DANIELS. I have; yes, sir.

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY.

(The witness was sworn by the chairman.)

The CHAIRMAN. Will you proceed, Mr. Secretary?

Secretary DANIELS. Mr. Chairman and gentlemen of the committee, you are near the close of a hearing, which, from certain angles has given you a point of view of the American Navy which is wholly foreign to the spirit and achievement of the brave and chivalrous men who make up that honorable and honored service. On the part of certain critics, self-appointed, to ferret out the molehills of mistakes which they exaggerate into mountains, you have been wearied and the public nauseated with the abortive attempt to make a perspective in which a noble and notable accomplishment appears as the dim and fading background of a frontispiece of comparatively unimportant errors of judgment.

I have not come before your committee to answer criminations with recriminations. Ever since navies began there have been wide differences of opinion among officers as to the kind of ships, the caliber of guns, the training of men, the disposition of forces. Sometimes these differences have developed into acrimonious discussions. If you will search your record, you will find that some dozen years ago there was a spectacular attack upon the design of our battleships. Admiral Sims was perhaps the leading spirit of the small group of officers concerned, and received much publicity as a destructive critic. Presumably it was at that time that he made the remark ascribed to him by the World's Work for August, 1919, that a certain United States battleship "is not a battleship at all. She is the worst crime in naval construction ever perpetrated by the white race."

In view of the scandalous charges spread broadcast at that time, the Naval Affairs Committee of the Senate undertook an investigation and heard Admiral Sims and a number of other officers. Under the searching, competent and impartial investigation of Senators Eugene Hale and Benjamin R. Tillman, the mountain of charges brought forth a mouse of fact, and in the end the committee did not even dignify it by a report.

Going further back, we will recall that after the glorious victory in the Spanish-American War there followed a squabble about honors which tended to tarnish the fame of those who were engaged in it. In view of what happened after that war (and similar instances could be quoted in our naval history) it may have been too much to expect that naval differences in the World War would be minimized and forgotten in the glory of victory and the proud place which naval efficiency won for our country. Mistakes are inevitable when mere men undertake such gigantic enterprises as those of the United States Navy during the World War, but I know by daily consecration to a great task, and all the world knows by unprecedented achievement, that whatever mistakes were made they were small in comparison with the splendid performance. Only one thing really counts in this great world and that is the result.

As to the American Navy's part in the Great War there are no two opinions at home or abroad. With an unprecedented task, with methods of warfare new and changing to meet the new murderous conditions which no nation dreamed would be brought into play, our Navy exhibited a resourcefulness and an efficiency at which the world marveled. That record, achieved in days of stress, stands untouched to-day and for all time by criticisms from within or without.

For me it has been a privilege to have served as Secretary of the Navy in the years of its largest expansion and its widest service to our Republic and to the world. I came into the office with appreciation of its high traditions and shall lay down the trust happy to have been the loyal shipmate of 6,000,000 men who, in the testing times, proved that the Republic's confidence in naval resource and naval efficiency was well placed. I am happy that, though there may have existed in the days of struggle opposing views as to the best way to employ the naval strength to win victory, no differences weighed against the immediate, constant and whole-hearted and intelligent consecration to the varied duties the Commander in Chief of the Army and Navy assigned to the Navy. Here at home, where preparation and supplies and ships were hurried to the most needed service with the utmost speed by earnest Regular and reserve officers and men and civilians, equally devoted, what was accomplished was truly wonderful. Enough can never be said of the celerity and efficiency of the naval organizations which made possible the safe transportation of 2,000,000 troops to Europe, the carrying of supplies, the unceasing warfare on the submarine murderers, the laying of the barrage across the North Sea, which was the crowning and outstanding naval offensive contributed to end German sea power, and the scores of other duties which were undertaken by the Navy. Nothing I can say would too generously praise the brave officers and men sent overseas, charged with important missions ashore, and with a duty afloat that called for a courage and a daring and a resourcefulness as great as John Paul Jones and his associates displayed when

fighting across the ocean. This history of the scores of the encounters with the submarines, of the protection of troop ships, of the convoy of cargoes, of the laying the barrage and sweeping the mines and other achievements of audacious and bold men of the sea of our Navy, will make a story that will thrill the pulse of unborn generations.

My position enabled me to test the qualities of the naval personnel; to know the difficulties under which they wrought, their disregard of hardships, their consecration to duty, and their splendid performance by such teamwork as has not been surpassed in history. From first to last there was on the part of all the will to win in such a degree that there was never the faintest doubt of the result. And this was true of the men in subordinate and high stations alike. Hardly without exception—or with exceptions too few to remember—when the American Government through the President and the Congress laid down the policy the answer of the men in the Navy, no matter what any thought of this or that disposition of force, was the cheerful and victorious and hearty, "Aye, aye, sir."

And so the war came to an end with honor to the Navy. It had not only done well its purely naval fighting and scouting and conveying and patrolling and many other jobs never before assigned to any Navy, but it had won the gratitude of the 2,000,000 American soldiers transported abroad and of all who loved them for its vigilance and success in landing them safely in France. That achievement, Mr. Chairman, was due to no chance or accident or favoring winds. No such troop movement over such an expanse of water had ever before been attempted. When, in spite of submarine attacks, the first transports carrying troops reached Europe without the loss of a ship or a man, there was a prayer of relief and thanksgiving all over America and the allied world, for all knew that the fate of nations hung upon the ability to safely land American fighters in France. In comparison with that essential to winning the war nothing else counted. And who in advance would have dared even to hope in those fateful days from June, 1917, when the first transports sailed, until November 11, 1918, when the signing of the armistice made the sea safe from undersea assassins, that of the vast army transported and guarded by the United States Navy on hundreds of Europe-bound transports not one life would be lost?

It was indeed a miracle attesting to the wise planning, the close cooperation of Army and Navy, and to the marvelous efficiency of naval navigation and naval resourcefulness. The planning and safe execution of that epoch-making transportation was due to the wise action of the high officials in the War and Navy Departments who, from the beginning to the end of the war, worked together with perfect understanding, and to all the capable officers and men entrusted with this supreme job. It was well done and done expeditiously. That fact alone, sir, is answer to most of the criticisms heard by your committee.

In the face of a great job greatly done, it is a matter of national regret that any naval officer should for any reason or any motive seek either to minimize it or to cast aspersions upon the splendid work by brother officers in or out of the department. I confess to surprise and regret when Admiral Sims made public the letter which was the occasion of your hearing. During the conduct of the war, in several im-

portant particulars, I felt he did not wholly measure up to expectations in certain particular ways, of which six may be mentioned:

1. He lacked the vision to see that a great and new project to bar the submarines from their hunting grounds should be promptly adopted and carried out, no matter what the cost or how radical the departure from what ultra-prudent men regarded as impracticable.

2. He seemed to accept the views of the British Admiralty as superior to anything that could come from America, and urged those views even when the Navy Department proposed plans that proved more effective.

3. In public speeches and other ways he gave a maximum of credit to British efforts and minimized what his country was doing.

4. He coveted British decorations and seemed to place a higher value on honors given abroad than by honors that could be conferred by the American Government.

5. He aspired to become a member of the British Admiralty, and wrote complainingly when the American Government declined to permit him to accept such tender by the King of England.

6. He placed protection of merchant shipping, with concentration of destroyers at Queenstown, as the main operation of our forces abroad, failing to appreciate that the protection of transports carrying troops to France was the paramount—and I wish to emphasize that was the paramount—naval duty until I felt impelled to cable him peremptorily that such was our main mission.

As to the North Sea barrage, the department felt it necessary, so much importance did it attach to the enterprise, to send Admiral Mayo over to convince our British naval associates of its feasibility, after Admiral Sims had accepted the view of the British Admiralty that it was impracticable, and had tried to induce the Bureau of Ordnance and the department not to press it. After it was finally acquiesced in by the British Admiralty, Admiral Sims did carry out the department's orders with reference to it though his previous attitude had delayed several months this enterprise. Though without precedent, this giant project, conceived by officers of the American Navy in Washington, was carried out with brilliant success.

I never gave any public or private criticism of Admiral Sims for his failure to show early vision in this connection, or of his other mistakes or wrong views. Admiral Mayo succeeded with the British Admiralty where Admiral Sims had lacked faith, and the British Admiralty in the fall of 1917 finally accepted the plan we proposed in April, based upon the Bureau of Ordnance's recommendation.

As to his desire for British honors, I informed Admiral Sims plainly of the views of the American Government, declined to permit his acceptance of honorary membership in the British Admiralty. While disapproving it officially and privately at the time, I regarded it as rather a love of glitter and foreign recognition and honor than anything else.

As to his one idea, and controlling idea, of carrying on the war by putting virtually all our destroyers at Queenstown, giving priority to protection to merchant ships over that of troop transports, the department compelled the carrying out of its policy by this peremptory order, which I penned with my own hand [reading]:

The paramount duty of the destroyers in European waters is principally the proper protection of transports with American troops. Be certain to detail an adequate

convoy of destroyers, and in making the detail bear in mind that every thing is secondary to having a sufficient number to insure protection to American troops.

The above cablegram was sent by the Secretary of the Navy to Admiral Sims on July 28, 1917.

Though the department had disapproved some of his recommendations and denied some of his desires, I mistakenly supposed until the letter of January 7 that he had accepted and acquiesced, with more or less grace, in the department's disposition of ships and its other official actions as a loyal officer accepts the decision of his superior, even though he might personally hold other views. I did not know when Admiral Sims returned from France or until the early part of 1920 that he had made to Senator Glass, Congressman Byrnes, and Congressman Whaley, a statement detailed as follows by Congressman Byrnes. Mr. Byrnes said [reading]:

In October, 1918, with two of my colleagues, Representative Glass of Virginia—

Now Senator Glass—

and Representative Whaley, of South Carolina, I went to France, and among other places visited Tours, the headquarters of the Services of Supply of our Army, and was thrilled with pride at the marvels worked by this branch of the service. On October 30, with my colleagues, I saw Admiral Sims, who was then in Paris. I shall never forget that interview. The armistice had been requested by the enemy. Sims told us of the magnificent progress made by the British on the English front, and as we listened he proceeded to tell us that the armistice would have been granted, because Pershing had been unable to break through the German lines owing to the absolute breakdown of transportation behind the American lines. With pathos in his voice he told us how unfortunate it was that this breakdown occurred at so critical a moment. In amazement we listened, and in the monologue he delivered he proceeded to tell us that while Americans believed their Navy was working wonders, that as a matter of fact we had but 3 per cent of the antisubmarine craft in English waters; that Great Britain had brought over two-thirds of our troops, and had escorted one-half of them.

Not satisfied with telling us how small a part we played upon the sea in time of war, he proceeded to tell us that in time of peace we should seek to play no part at all. He expressed the hope that we would not be led astray by the agitation for a merchant marine. He declared that England, because of her geographical location, must necessarily control the seas, and that we could rely upon her at all times providing a merchant marine to transport our goods to foreign markets.

When I took issue with him, he stated that even if we entertained the view that it would be desirable for the United States to possess a merchant marine, that it was impossible because we could not compete with Great Britain; that it would be necessary to pay subsidies, for which our people would never stand; and that it was the part of wisdom—

Listen at this—

for us to develop the great West and leave the sea to Great Britain. With that Government, he said, we never would have any trouble, and Great Britain could be depended upon—

Think of it—

at all times to care for our business upon the seas.

Mr. Chairman and gentlemen, if I had known that Admiral Sims had made that statement reflecting upon the Army and the Navy of the United States, I could never have given the recommendation for his promotion which I generously wrote to the Naval Affairs Committees of the House and Senate.

He had not then attacked the Irish people. I thought then he had only defended American sailors, a proper thing to do, when attacked unjustly by what he termed a lawless element in Cork. If I had known,

sirs—and, gentlemen, I wish to emphasize this—if I had known that he proposed under the permission granted him to tell the story of what the Navy had done overseas to denounce the Irish people, as he did in his articles in *World's Work*, the permission would not have been granted.

And so, gentlemen, though not in any way approving any of the mistakes and erroneous views of Admiral Sims during the war, the department gave him every consideration. I felt there was glory enough for all. I forgot his indiscreet speeches and actions, forgave his tendency to believe in the infallibility of the British Admiralty, and when, in January, 1919, he cabled desiring to return to America and requesting to be made president of the War College—and, by the way, he is the only admiral in the war that ever asked any particular and special assignment—I promptly and gladly granted his request, and upon his return to America recommended to Congress that he be made an admiral for life, and was more than generous in appreciation of his service in the war, as, indeed, I was and am of all the officers and men who served in that great struggle. It is far from any purpose of mine, gentlemen, to detract from the work of Admiral Sims in London or to say anything that reflects upon his sincere efforts to win victory. He was undoubtedly animated by the same whole-hearted resolve to defeat the German forces as were Admiral Benson, Admiral Mayo, Admiral Rodman, Admiral Badger, Admiral Fletcher, Admiral Wilson, Admiral Niblack, Admiral Gleaves, Admiral Strauss, Admiral McKean, Capt. Pratt, and all the other splendid officers who held responsible positions in the World War.

Admiral Sims's letter of January 7 was not made public by the department, or even the fact that it existed. It was referred to the General Board of the Navy, a distinguished body of officers who need no introduction to the members of the Senate Committee on Naval Affairs (Admiral Sims himself is a member of this board), where it would have received all the consideration to which it was entitled, and such consideration by professional experts (including Admiral Sims) might have resulted in good. As a result of the publicity given his letter by Admiral Sims, and the consequent investigation by this committee, wide publicity has been given to a number of charges by Admiral Sims reflecting upon the conduct and results achieved by the U. S. Navy in the World War. We know that hindsight is better than foresight, and after any great undertaking, however successful, it is easy to point out things done that ought not to have been done, and things left undone that ought to have been done. The most serious charges made by Admiral Sims are without foundation, and others are not justified. As to some of the actions he assumed to criticize he was necessarily ignorant of many things known to his superiors, whose field was wider and knowledge more complete. But upon his assumption of what he calls errors and a small foundation of facts, Admiral Sims has erected a towering structure of exaggeration and misrepresentation.

You gentlemen have heard certain witnesses who have to some extent supported Admiral Sims, but who mainly devoted their energies to rehashing ancient animosities, being largely people with a grievance. Practically no witness introduced by Admiral Sims had personal knowledge of the principal matters dealt with by Admiral Sims himself. You have heard a number of the most competent

officers of the Navy, with first-hand knowledge of what happened during the war, owing to the responsible positions which they occupied, whose testimony I think would have been accepted by any open-minded man as absolute refutation of practically all of Admiral Sims's charges.

I can add but little to what has been told you already without covering again the ground which has been covered by the most capable officers of the Navy. I feel, however, that the charges against the Navy are so scandalously unwarranted by actual facts and conditions that it is my duty to give you gentlemen the benefit of the fullest possible statement, covering, of course, only those activities which constitute the outstanding achievements of the American Navy, which from top to bottom did its full duty during the war and measured up to the highest standards that can be conceived.

Mr. Chairman, there are those who believe that mud once thrown by muckrakers leaves a stain difficult to erase, and these may fear that the piling of proof on proof by great naval officers, exposing the fallacy of every criticism retailed before your committee, will not wholly remove the first impression made by these unjust charges. Those who take that view little understand the spirit of the American people. It is not too much to say that when he read his sensational attack people were amazed at the wantonness of the charges and shocked at the idea that a naval officer could be guilty of such a breach of confidence as his letter revealed. Then as they heard the earliest refutations they became righteously indignant. Now that every scintilla of unjust criticism has been completely and fully and overwhelmingly refuted by the ablest and most trusted officers in the American Navy, the indignation of the people of America has risen to a feeling of national outrage and condemnation, and nothing short of it.

The Navy and its service in the World War stand without a trace of the mud with which a few have sought to bespatter it. The evidence has had only one effect, and that has been a feeling of deep regret at the necessity of withdrawing approval from Admiral Sims and replacing it with deep and lasting disapproval. The only man injured in public esteem by his charges reflecting upon his brother officers and attempt to hold their self-sacrificing and successful service up to condemnation is Admiral Sims himself.

RESPONSIBLE OFFICERS, BY THE TESTIMONY OF 10 TO 1, REFUTE CRITICISM BY SIMS.

So far as the acts of the Secretary of the Navy in the conduct of the war are concerned, I would be perfectly satisfied to leave the case exactly as it stands on the evidence and testimony laid before you, without thinking it necessary to add one word thereto, so clearly do I feel it has been proved that the criticisms you have been inquiring into, so far as they may be said to have any importance or serious weight, have been directed solely against the military activities of the department, and particularly against the broad, fundamental policies of strategy and naval tactics. The broad naval policy of the department must depend upon the policy of the Government, not the Navy Department. Strategy and tactics, particularly in time of war, must be determined by military officers con-

nected with the department whose special training and long experience have fitted them for a task which no civilian can properly undertake.

As to whether these criticisms were justly founded or not, you have had before you the 11 admirals in whose hands rested the technical military decisions and operations and those who held the most responsible positions in our Navy during the World War.

There were 12 of these high ranking officers charged with great responsibility. You have heard 11. The twelfth, Admiral Gleaves, who was in charge of the transportation of the troopships that carried the soldiers to France, is commander in chief of the Asiatic Fleet, and, while regretting you will lose his testimony, I did not feel justified in ordering him from his distant station to testify.

One of these officers is the author of the criticisms. The other 10 have so ably and flatly denied their correctness or justice in their own statements as to make it seem really unnecessary for me to add much thereto. However, inasmuch as the judgment and executive ability of these officers has been brought under public criticism by one of their own number, and as under the old traditions of the Navy these officers look to the civilian Secretary to defend them before the public, respecting, as they do, not only the regulations but the spirit of the Naval Service and discipline which has always held it improper and unwise for military officers to enter into public wrangles with each other on purely military matters, I feel that in justice to them I should make clear certain matters which, perhaps, while I trust they have been clearly understood by you gentlemen, may not have been fully grasped through the fragmentary reports of these hearings in the public press.

I have always conceived it to be the duty of the Secretary of the Navy in time of war, and so far as I know such has been the conception of all my predecessors—to select the most able and experienced officers and to rely upon their judgment and decisions in regard to the purely technical military matters of the Navy Department. I think I may say with some pride that in no previous war has the military organization of the Navy been given such a free hand or afforded such organization for the purpose of conducting military operations along the best military traditions as has been the case in this conflict.

In the establishment of the Office of Naval Operations, and in placing the Chief of Operations in a position of responsibility for the direction and operation of the fighting forces of the Navy, this administration demonstrated long before the war the necessity of efficient organization, which proved its value in the greatest war in history; and no test of organization and efficiency is comparable to the test in the stress of war.

Compare, if you will, the workings of the military organization of the Navy Department in this war with the so-called naval strategy board of the Spanish-American conflict and you will see for yourselves the improvement which has been made from the military officer's point of view; and at the same time, I feel that the important and necessary civilian supervision of the entire operations of the Navy Department, so many of them essentially civilian in their character and involving questions on which no naval officer would claim to have the expert civilian knowledge necessary to solve properly, has not

been sacrificed. The Navy, even in time of peace, is an enormous industrial establishment. It is one of the country's greatest ship-builders, for instance; its workshops produce almost everything which goes into the making of a ship. Its yards hold many thousands of civilian workmen. Its purchases must be conducted along the lines of best civilian business experience, and I find, in all these criticisms, no question raised or even intimated as to the efficiency with which this tremendous side of the Navy has operated.

In regard to that part which has been under criticism of one of the 11 officers referred to, considering the inevitable differences among all military authorities in matters relating to purely military affairs, I think it is surprising and gratifying to see that the verdict of these officers is 10 to 1 as to the correctness of what we did. Had there been, during the war, a serious difference of opinion as to what should be done among those charged with the duty of determining our military actions, and had such differences been supported on each side by a nearly equal number of experienced officers, it would, of course, have been my duty to have decided between them. I have been fortunate, gentlemen, that no such condition arose, for that is a heavy responsibility for any civilian, untrained in the technical art of warfare, to have undertaken.

What I feel is needed from me at this time is not a defense, but a clear and brief résumé of what has already been testified to, that the public may clearly understand that the defense of the Navy's action has already been ably and fully made by the highest officers of the Navy, together with some statement of mine of what the Navy actually did during the war. You have heard long statements of what it did not do. The country's pride will be heightened by the facts of some of the great things it did do.

The Navy has been, and I think justly, praised not only by our own people and by all of the military authorities of our Allies, but even, though somewhat grudgingly perhaps, by our foes. It would be indeed remarkable if the opinion of one officer, who has obviously not been in a position to know all of the underlying reasons for our actions at any time, should confuse the future historian, or cast any doubts upon the deservingness of the eulogies which the Navy has received.

BROADCASTED HIS CHARGES AGAINST THE NAVY.

The portion of Admiral Sims's letter of January 7 which, perhaps more than any other of his statements, shocked the country, was the paragraph embracing what he called an "explicit admonition" not to "let the British pull the wool over your eyes," etc. The people could not understand how any patriotic American who put the good of his service first, could possibly spread broadcast a statement which reflected upon his own Government and might tend to disturb the cordial relations with a friendly power. They were all the more surprised that a naval officer of high rank, sent on a secret and confidential mission, should violate the confidence reposed in him and publish a statement which he evidently believed would damage a fellow officer and cast a doubt upon the Navy's whole-hearted devotion to the allied cause. I must confess that it shocked me, for in all my years of association with officers of the Navy this was the first time I have ever known one to make public any confidential conversation with a su-

perior officer. Gentlemen, I did not believe it was possible for an officer of our Navy to do such a thing.

How was that letter made public? Admiral Sims stated that he "supposed by the Navy Department." He was quoted by the New York Times as saying that "no person had seen the letter except the members of his staff and his wife." Later, on March 22, in his testimony before your committee, Sims admitted upon cross-examination that he had shown it to H. P. Davison, of the firm of J. Pierpont Morgan & Co., in Mr. Davison's library, Admiral Sims having gone to New York to attend a dinner given by Mrs. Whitelaw Reid, owner of the New York Tribune and widow of the late Whitelaw Reid, former ambassador to Great Britain.

The general public may not be greatly concerned with the question of how the letter was made public. It is quite different with naval officers, whose first thought is of the high traditions of the service. Not one but a score of them have asked me that question, and it may be well to give the facts so that there can not hereafter be any doubt or misunderstanding. The letter is dated Newport, January 7. It was received in Washington, January 9. It was brought to me by my confidential clerk. I read the first page and had read down to the so-called "orders" and "explicit admonition" when a gentleman with whom I had an engagement was announced. The letter, so-called "Certain Lessons of the Great War," was returned to its envelope, placed in the middle drawer of my desk. I locked the drawer, put the key in my pocket, and nobody saw that letter until after the Washington Post on the morning of January 14, under sensational headlines, printed the following [reading]:

Secretary Daniels has received another letter from Admiral William S. Sims, which will prove of great interest to the service and the country, if the Secretary does not succeed in suppressing it. It is a frank and fearless exposé of the hopeless story of maladministration, mistakes and blunders into which the American Navy has fallen as a result of Mr. Daniels's policies, and it tells the Secretary things that became evident to the admiral during the war and are even more evident now.

It is, in effect, an attempt by the officer who was commander in chief of the American naval forces—

And just there I may say that Admiral Sims was never commander in chief of the naval forces—

in European waters during the war and is perhaps foremost among ranking officers in the service, to rescue the morale of the United States Navy from the Daniels policy by appealing directly to the men responsible for it all.

Admiral Sims is now president of the Naval War College at Newport, R. I., and the letter was sent to Mr. Daniels from there. It is becoming apparent that the unwillingness of Mr. Daniels to accept the criticisms of Admiral Sims on the matter of naval awards without reply—

And I may say parenthetically that that is not true, because I gave a very full and comprehensive reply—

and the efforts of the Secretary to pass unnoticed the charges that he has brought condemnation and ridicule of the service upon himself by his actions, are not going to heal the breach between the Secretary and the admiral.

* * * * *

Admiral Sims will be the first witness before the Senate Naval Affairs subcommittee Friday, and his presence here will probably accentuate the differences between himself and the Secretary.

If this officer, who is generally regarded here and abroad as one of the most competent naval authorities in the world, finds it necessary to expose Mr. Daniels' management of naval affairs and frankly and fearlessly undertakes the task it is not probable that Senators will show lack of interest.

In answer to an inquiry by representatives of the press that morning I stated that a letter had been received from Admiral Sims, but declined to discuss it or make it public. It was not made public until Saturday, January 17, when Admiral Sims read it to your subcommittee. The way in which this letter, which had nothing whatever to do with medal awards, was introduced in the committee's hearing on that subject is shown by the following extracts from the record:

The CHAIRMAN. Admiral Sims, I think in connection with this matter if you have had any further correspondence with the Secretary of the Navy about the question of awards and their effect on the morale of the service, it would be well for you to give that correspondence to us at the present time.

Admiral Sims. It does not bear particularly upon the question of the awards, but it does bear upon the question of the morale of the service.

The CHAIRMAN. Then I think it is decidedly germane to this issue.

Admiral Sims. As I said before, the action of the board in the awards is only the last straw in this whole business.

(Record of medal awards, p. 304.)

Senator Pittman was allowed to proceed for some time, when Chairman Hale again brought up the matter of the letter:

The CHAIRMAN. Now, Senator Pittman, with your permission, we will go ahead with the question I put to the admiral, if the admiral cares to proceed.

Admiral Sims. As I said in the little preliminary statement that I made yesterday, this business of the award of medals fell on the service in a very critical condition of morale, which goes back a long way and has quite a good deal to do with the way in which the war was managed from a naval point of view, and it is this question of morale as well as the question of awards that is being investigated. It seems to me that it is quite proper that anything that bears on the morale should be taken into consideration.

This is a letter that I have written to the Secretary of the Navy under date of the 7th of January, 1920. As I said in my preliminary statement, it is the duty of an officer who has been in a responsible position of command during a considerable war, by the regulations of the Navy Department, to state any criticism that he may have which, in his judgment, will be useful in avoiding mistakes in future wars, and it is the mistakes we want to avoid and not camouflage in any respect. The following is this letter.

(Admiral Sims then read the letter in full as it appears in the hearings upon medal awards, pp. 309 et seq.)

Admiral Sims immediately pulled the letter out of his pocket and read it in the public hearing. If he wished to make public what up to that time he called an "explicit admonition" given along with his "orders" imparted in confidence, he could not have chosen a more ostentatious and well-planned manner of securing publicity. If, on the contrary, as he said, he had written it only for naval officers, nothing would have been easier than, when Senator Hale asked him if he had a letter bearing on naval awards, to have said that he had written a letter to the Secretary of the Navy, bearing upon a totally different subject, but as he had written it only for naval uses and to make it public would be a violation of naval regulations and naval traditions, he begged to be excused from reading it. Such a statement would have left the so-called "Lessons of the war" for the consideration of the General Board of the Navy, where lessons of the war by other officers receive the consideration their merits justify. But he had it in his pocket, evidently only awaiting the opportunity, which the hearing afforded him, to give his charges the widest possible publicity.

SIMS'S INSTRUCTIONS AND ORDERS.

Admiral Sims has told you of his being called to Washington and of the instructions he received previous to his being sent to London on a confidential mission, a mission so confidential that his instructions were not committed to writing. He said in his letter of January 7, 1920:

Brief orders were delivered to me verbally in Washington. No formal instructions or statement of the Navy Department's plan or policy were received at that time, though I received the following explicit admonition: "Don't let the British pull the wool over your eyes. It is none of our business pulling their chestnuts out of the fire. We would as soon fight the British as the Germans."

In the letter from which the above is an extract addressed to the Secretary of the Navy and made public by Admiral Sims in his former hearing before the Senate subcommittee, he called the statement above quoted an official "explicit admonition." Now Admiral Sims says regarding the same admonition from the same officer at a later date that it made so little impression upon him that he had "completely forgotten the incident," says he "did not remember it distinctly" and regarded it as "a personal idiosyncrasy of the Admiral." Why this change? If it was an official "explicit admonition," which he made public, he convicts himself of violating sections 2, 3, and 4 of article 1534 of the Regulations for the Government of the Navy which are in these words:

(2) No person belonging to the Navy or employed under the Navy Department shall publish or cause or permit to be published, directly or indirectly, or communicate by interviews, private letters, or otherwise, except as required by his official duties, any information in regard to the foreign policy of the United States, or concerning the acts or measures of any department, of the Government or of any officer acting thereunder, or any comments or criticisms thereon; or the text of any official instructions, reports, or letters upon any subject whatever, or furnish copies thereof to any person, without the express permission of the Navy Department.

(3) Officers and other persons in the naval service desiring to publish articles on professional subjects, except translations from foreign publications or articles of a purely historical nature, shall submit the manuscript of such articles to the department (Office of Naval Intelligence) for scrutiny before publication. Such articles must be couched in proper and temperate language and free from personal attacks on, or impugment of motives or conduct of, persons in the Government service, and must conform strictly to the requirements of paragraph 1 of this article. The publication of such articles, if authorized, shall be over the signature of the author.

(4) Nothing in this article shall be construed as prohibiting officers from forwarding to the department, through official channels, well-considered comment and suggestions with a view to promoting the efficiency of the service and the public interests; on the contrary, such suggestions are invited, but they should be in regard to things or methods and not a criticism of persons, and should in all cases be accompanied by a well-digested plan for improvement. Such suggestions, if approved by the department, will be entered on the officer's record and he will be duly notified to that effect.

In his testimony before your committee Admiral Sims makes another statement wholly inconsistent with the fact that he considered the alleged statement only an "idiosyncrasy" of Admiral Benson, for he makes, by more than inference, a charge against him as unworthy as it is unfounded. He said to your committee:

Now, my reason for putting it in the letter may not be so clear to a civilian as it is to a military man, but the spiritual foundation of every war is the will to victory, and if any man, no matter how honest, has an invincible prejudice against the people that we are fighting alongside of, it is very probable that it has an unconscious influence upon him; and that is the reason that in submitting this letter for the consideration of the Navy Department, I put that in there, as one of the most important things in the

letter, that if ever we go into a war again we want to make sure that the spiritual foundation of our organization, the will to victory, is sound.

I do not need to tell your committee, or to tell the American people or our Allies, that the "will to win" completely dominated Admiral Benson, that he was "whole-heartedly" working day and night to achieve the great success which his efforts more than those of any other naval officer brought about, and that his 100 per cent Americanism and great achievements justify the distinguished honors conferred upon him at home and abroad. Mr. Chairman, there is a peculiar malady which affects a certain type of Americans who go abroad and become in many respects un-American. That malady causes them to regard others, who do not lose their thorough-going Americanism and undivided allegiance, as having "idiosyncrasies." Sims genuflected so before the British Admiralty ideas and accepted British views so fully and coveted British honors so earnestly that he came to regard as anti-British such a rugged American as Admiral Benson who is "all American," neither "pro" nor "anti" with reference to any other country.

In his testimony before your committee some weeks later, referring to the so-called "explicit admonition" Admiral Sims seeks to escape from the serious consequences, which violating confidence and naval custom and regulation would invite, if the language which he attributed to Admiral Benson, was an "explicit admonition." He said in his testimony:

About six months later in my office in Paris he made a similar statement; at least, to the effect that I was not to allow the British to pull the wool over my eyes or to pull their chestnuts out of the fire, or something to that effect. I will admit that I had completely forgotten the incident. It was recalled to my mind by a member of my staff who was present, and who heard it. I think that the reason that I did not remember that distinctly was because I regarded this as a personal idiosyncrasy of the Admiral.

I remember very clearly the instructions given Admiral Sims and the conversation that took place at the interview in the office of the Secretary of the Navy. The United States was not then at war, though I believed that Congress would declare that a state of war existed between the United States and the Imperial German Government within a few days or a few weeks. After the usual greetings, when Admiral Sims came into the office, I told him of the letter from Ambassador Page suggesting that an American Admiral be sent to London; or I showed him a copy of the letter. I do not remember which. That is immaterial. I am not sure whether I gave him a copy of the letter or only told him of its contents. But he was made acquainted with the contents of the letter and the fact that Ambassador Page had conveyed the offer of the British Admiralty to furnish the Admiral selected to go to London with "a sort of special staff" who would "give him the results of the whole naval work since the war began."

I told Admiral Sims that the President had decided to send him on the confidential mission outlined in Ambassador Page's cablegram, and we wished him to use the cable freely and keep the department fully posted on conditions as he found them in London. In that connection we talked of the destruction of merchant shipping, and I told him that the President could not understand why the British did not convoy their ships through the danger zone, and I added that I had informed the President that there was a difference of opinion ✓

among our naval officers about the convoy system, and in this particular accepting the British convoy which had been maintained for three years, but that the President was decidedly of the opinion that ships should be convoyed.

Before he left I impressed upon Admiral Sims the fact that we were not at war and that until Congress acted, the policy of neutrality must govern all his public acts and utterances, incidentally recalling his Guildhall speech, in which he had said:

If the time ever comes when the British Empire is seriously menaced by an external enemy, it is my opinion that you may count upon every man, every dollar, every drop of blood of your kindred across the sea.

I added that, of course, Secretary Meyer and President Taft were right in their reprimand for the utterance, and that he had been selected for this mission not because of that speech but in spite of it, in the confidence that he could obtain the information this Government would desire in case Congress declared war. I do not recall that I specifically told him that his mission involved the most sacred confidence; but that was clearly implied if not expressly stated. Because of its confidential character it was agreed that he would not wear his uniform on his trip and would go over on a commercial line, and would travel in civilian clothes, making his departure quietly and without anybody outside the department knowing of his sailing or his mission.

So confidential was the mission regarded that he was informed he would not at that time be detached from his duties as president of the War College, but this confidential mission would be in addition to his other duties. My recollection is that, in order to insure secrecy, at my suggestions, the Chief of the Bureau of Navigation himself wrote out his orders. They were as follows:

MARCH 28, 1917.

To: Rear Admiral William S. Sims, United States Navy, Commandant Naval Station, Newport, R. I.

Subject: Special duty.

1. Proceed to a port of Great Britain, leaving the United States on or about March 31, 1917, and on arrival carry out the confidential instructions which have been given you.

2. Inclosed are copies of orders to you and to Lieut. Commander John V. Babcock, signed by the Chief of the Bureau of Navigation, dated March 28, 1917, which will be disregarded.

3. The United States naval attaché, London, England, is hereby authorized to advance to you such funds as may be required.

4. At such time as may be convenient you will confer with the United States ambassador to Great Britain.

5. You will acknowledge the receipt of this order by dispatch, addressing same to "Rear Admiral L. C. Palmer, Bureau of Navigation, Navy Department," giving the name of the vessel on which you will take passage, and sign the dispatch "Special."

6. This is in addition to your present duties.

L. C. PALMER, *Acting*.

My confidential instructions given him personally and the above order constituted the only orders he had when he left the United States on his special mission for London. The following are the later orders involving his position and status issued to Admiral Sims during the war:

APRIL 28, 1917.

To: Rear Admiral William S. Sims, United States Navy, care of American embassy, London, England.

Subject: Detached commandant naval station, Newport; to command certain destroyers, etc.

1. You are hereby detached from duty as commandant of the naval station, Newport, R. I., and from such other duty as may have been assigned you at Newport; will assume command of all American destroyers operating from British bases, including tenders and auxiliaries thereto which may be sent later.

2. You will continue on your present duties in England, this being in addition to the duty referred to above.

JOSEPHUS DANIELS.

To: Naval attaché, London.

Please communicate the following letter from the President of the United States to Admiral Sims, dated White House, Washington, May 26, 1917:

Under an act of Congress which was approved May 22, 1917, you have been designated commander of the United States destroyers operating from British bases from May 26, 1917. It is my pleasure to inform you that under this designation you will assume the rank and hoist the flag of vice admiral in the Navy on receipt of advice of this designation.

Respectfully,

WOODROW WILSON.
DANIELS, *Secretary Navy.*

JUNE 14, 1917.

To: Vice Admiral William S. Sims, United States Navy, commanding United States naval forces operating in European waters, via Chief of Naval Operations.

Subject: Change in title.

1. Your title is hereby changed to "Commander, United States naval forces operating in European waters."

JOSEPHUS DANIELS.

I may say here that in the meantime Admiral Sims had requested that in addition to his other duties, we should withdraw our naval attaché to London, and make him also naval attaché; and so, in response to his request, the following order of November 20 was made [reading]:

NOVEMBER 20, 1917.

To: Vice Admiral William S. Sims, United States Navy, Commander, United States naval forces operating in European waters.

Subject: Additional duty as naval attaché, London, England.

1. You will assume duty as naval attaché, London, England.

2. This is in addition to your present duty.

(Confirming dispatch of Nov. 17, 1917.)

JOSEPHUS DANIELS.

These several orders and instructions constituted him naval attaché as well as "Commander United States naval forces operating in European waters." Inasmuch as he actually commanded no ships in European waters the title given him is wholly misleading. His real function was that he was in substance an assistant abroad to the Chief of Naval Operations and was also naval attaché in London. As all our ships in British waters were operated by direction of British officers, he was subdirector of operations under Benson rather than commander of forces afloat, because he never commanded ships afloat except a few days when he relieved Bayly at Queenstown and flew his flag.

ADMIRAL BENSON AND THE WORK OF OPERATIONS.

The country has taken the measure of Admiral Benson. The unjust aspersions cast upon his administration of his great office by Admiral Sims has no foundation in fact. The truth is that in his hearings before the House Naval Affairs Committee in 1916, asked

if defects in turrets of which he complained could occur now, he replied in the negative, and added:

And we will never have them again because of the presence of Admiral Benson in his present position. If I make a criticism now it goes into his hands, and he can tell the Secretary whether it is well founded, and if it be well founded, it will be rectified if practicable.

That was his opinion of Admiral Benson and his position in 1916. He knows, and all the Navy knows, and all the world knows now, that every operation of the ships of the Navy during the whole war and before was in the hands of the Chief of Operations, and that this great responsibility was exercised with singleness of purpose—throwing the maximum power of the Navy into the war against Germany. I was in daily touch with Admiral Benson and the other officers in Operations; I know their zeal and enthusiasm; I know their faithful and intelligent work.

And I wish to say here in parentheses that Capt. Volney Chase was Assistant Chief of Operations in the early days of the war—an abler and better officer never lived—who gave his time so unremittingly that he lost his life as truly as any man lost his life on the field of battle. These gentlemen were given every cooperation and a free hand by the Secretary of the Navy. Their disposition of all the ships was made to make the American Navy do its great part in the World War. Their work will stand the test of time, and the charges that the service from the beginning was not wholehearted is a cruel and unjust attack upon a great naval officer and all associated with him in Operations.

You gentlemen have heard the statements of Admiral Benson, Chief of Operations, Admiral McKean, Chief of Material, and Capt. Pratt, Assistant Chief of Operations. They have the confidence not only of the American but also of foreign navies. Their service in the war was not surpassed by that of Admiral Sims or any other officer overseas. Indeed upon their shoulders rested the responsibility for the assignment and operation of every ship in the Navy and its readiness for war. Admiral Mayo has told you that the fleet was never in such good condition as when war was declared in 1917. Admiral Plunkett has told you that the Navy never could shoot so well as then. Capt. Palmer has told you that there never was a ship ready to go to sea that officers and men were not ready. And the results—the success of the naval ships in every character of service in fighting submarines, in transporting troops, in convoys, in mine laying, in patrol and all other activities—attest the efficiency of Operations and the department. Against that record, applauded at home and abroad, the discharge of poison gas by men with or without a grievance, can not prevail with any just men in the country, against the patriotic men in and out of the department who served with such fidelity and efficiency.

SIMS PROPOUNDS NEW DOCTRINE.

Is it proper for a naval officer to send a cablegram for the purpose of deception? It has always been regarded as justifiable and even necessary during a war to do or say anything to mislead the foe, but until recently no naval officer has acted as if he thought it proper or excusable to say anything officially to mislead the people of his own country.

In his letter of January 7, foreseeing that his telegram of December 23, 1917, would refute charges contained in that letter, Admiral Sims seeks now to explain away his action then when he said he "loyally accepted decisions" of the department, and then commended "the energetic measures being taken to increase our antisubmarine forces." Paragraphs 76 and 77 of Admiral Sims's letter are quoted below:

76. In the course of time, in the ninth month after our entry into the war, the lack of support referred to above, particularly in respect of the lack of adequate personnel for necessary staff duties abroad, became known in Washington. This was brought to my attention by the following cable message:

DECEMBER 22, 1917.

From: The Secretary of the Navy.
To: Vice Admiral Sims, London.

1732. At House committee hearings of conduct of Navy, Representative Britten said, "I would like to have copy of complaints which have come from Admiral Sims on the other side."

This is what I said to him:

If you desire to make statement of action of department in reference to sending and supplying force under your command since war began, please send in code.

DANIELS.

DECEMBER 22, 1917.

From: The Chief of Naval Operations.
To: Vice Admiral Sims, London.

Effort being made to create impression you have been hampered by failure of the Navy Department to meet your request for various things, particularly personnel. I feel that a strong positive statement on this subject from you is highly desirable.

BENSON.

Then Admiral Sims goes on to say in his letter as follows:

77. I was thus confronted with a situation, not uncommon in warfare, that demanded a decision that no military commander should hesitate to make; that is, such a decision as would be most likely, while avoiding conflict, to advance the common cause through the loyal support of superior authority by making the best of existing conditions, no matter how unsatisfactory. As the subject was one the public discussion of which in Congress would have supplied valuable information to the enemy, not to mention increasing his morale and decreasing that of our own fighting forces, it was manifestly desirable that it should be discouraged, and particularly that no information should be supplied that would render the discussion inevitable. The following cablegram was therefore designed to accomplish this purpose:

DECEMBER 23, 1917.

From: Vice Admiral Sims.
To: The Secretary of the Navy.

2366 your 1732. I strongly deprecate any effort to create an impression that our naval forces in European waters have been avoidably hampered by the failure of the Navy Department to comply with my recommendations for various things, particularly personnel.

It is of course well known that the antisubmarine campaign and the protection of allied shipping have been and still are hampered to a considerable extent by insufficient numbers of certain types of vessels, especially destroyers, and by certain classes of personnel, and I have repeatedly made recommendations in accordance with the requirements of this situation. To these recommendations the department has always responded with the assurance that reinforcements of both vessels and personnel were being sent to the maximum extent consistent with the many other requirements of the department in these respects.

The decision as to the relative importance of the employment of our naval vessels and personnel in the theater of actual war operations in European waters and at home must necessarily rest with the department, and I consider it the first duty of those at the front loyally to accept such decisions and to make the best of conditions, which are at present admittedly unsatisfactory and must so remain until the energetic measures now being taken to increase our antisubmarine forces produce the necessary reinforcements.

Sims.

The circumstances at this time were as follows: The Naval Affairs Committee of the House of Representatives was conducting an investigation into the conduct of the war so far as the Navy was concerned. It had a right to all the facts, and the department policy was to furnish it with all the facts, fully believing that every member of the committee could be relied upon to take no action as a result of information furnished which could in any way give aid or comfort to the enemy. Admiral Sims assumes the contrary.

Admiral Sims now states, in substance, that his cablegram of December 23, 1917, was disingenuous—to use a mild expression—and intended for purposes of deception. If that was his intention, he succeeded perfectly. I desire to invite the particular attention of the committee to this cablegram. It was an accurate statement of the facts as known to the department. Admiral Sims states clearly and correctly that he had made repeated recommendations and that he had been assured they would be complied with up to the maximum extent consistent with the many other requirements of the department. He states that he considered it—

The first duty of those at the front loyally to accept such decisions and make the best of conditions which are at present admittedly unsatisfactory.

Possibly this is the portion of the cablegram to which Admiral Sims now refers when he intimates that he drafted this communication with intent to deceive. The department accepted this cablegram at its face value. In fact, a close examination of this cablegram will show that much of the letter of January 7, 1920, is an enlargement and exaggeration of this cablegram which was sent over two years ago.

Of course—and, gentlemen, I wish to emphasize this—it is generally recognized that in war it is not only justifiable but laudable to deceive the enemy. Admiral Sims now propounds a new doctrine, that he considered it justifiable and proper to deceive his superior officers. He certainly did this, and the first intimation from him that his cablegram of December 23, 1917, was not a candid and accurate statement is contained in his communication, the basis for this hearing, written more than two years later. Further comment would be superfluous.

ADMIRAL SIMS AND HIS STAFF IN LONDON.

If one part of his complaint against the department is stressed more than another by Admiral Sims, it is that in the first weeks of his service in London he was not given what he regards as an adequate staff. He returns to this again and again and really seems more insistent upon the failure to send him immediately as many officers in London as he asked for than any other alleged sin of omission or commission of the department.

As to his staff, I need but to say that in London the Navy Department had Capt. McDougall, our naval attaché, an able and experienced officer, and the assistants in his office, Capt. Tobey, of the Supplies and Accounts Service, who had been in Europe for something like a year studying conditions abroad and who rendered valuable service not only as supply officer but in other ways, and was most helpful—these in addition to Admiral Sims and his aid,

Commander Babcock, who, according to Admiral Sims, rendered the highest service of any officer in the American Navy. In his testimony Admiral Sims says:

That officer [Commander Babcock] was not only my aid, but he was, as I have stated, my chief of staff—he was my everything. * * * I do not hesitate to state that there is no officer in the United States Navy to whom the people owe so much gratitude for the success of our operations on the other side as that man.

During the first few months after our entrance there was no need to send a large staff to London, while in the fleet and in the strenuous work in America, in order to render the greatest aid possible in the shortest time every experienced officer was greatly needed and all were working day and night under whip and spur.

Admiral Sims at that time had no duty except liaison officer. All the ships we sent over—and we dispatched 34 destroyers out of our total of 50—in April and May and June, though the British war council and the British Admiralty assured us through Admiral Sims that twenty-odd would “put down and keep down” the submarines in “the critical area”—all of these destroyers, as fast as they arrived overseas, were placed at once under command of Admiral Bayly, of the British Navy, and operated by him. Sims had, therefore, no duties afloat. He had no duties ashore except as a representative of the Navy Department to obtain information, to forward it to the Navy Department with his recommendations, and then to carry out the instructions he received. In addition to the capable officers named above to render assistance, he was given authority to employ all the civilian help he desired. I sent him the following cable on June 5 in answer to his request received June 2:

JUNE 5, 1917.

To: Admiral Sims.

You are authorized to detain Tobey.

Referring to your cablegram of June 1, the department will afford you every facility which the personnel and material conditions of the Navy permit.

The material bureaus have sent or will send technical officers.

The department disapproves of all commissioned personnel.

You have authority to employ necessary clerical assistants.

The *Dixie* is coming with the full complement.

Arrangements have been made to keep the United States Navy forces supplied with provisions, spare parts for repairs, and fuel.

Such expenditures as may be necessary to maintain your forces in efficient condition and for any purpose connected therewith are authorized.

DANIELS.

I submit that the spirit of that telegram leaves nothing to be desired in the way of the department's doing everything possible and everything needed. In the very cable in which I declined to permit him to give commissions to American youths abroad, who ought to enter the Navy as enlisted men or come home and enter the Army or the Navy and secure commissions when they had learned something about the duties of an officer, e w,ted

You have authority to employ necessary clerical assistants.

Gentlemen, I wish to lay stress upon this, that from first to last I sought earnestly and zealously to prevent class 4 from becoming an open door to favored youths who wished commissions without military training, and from making it a refuge for like youths who clamored to be commissioned and to serve abroad in clerical or other shore duties. I resolutely set myself against this abuse of class 4

at home and abroad, and managed, only by firm refusal, to leave the door wide open to prevent the threatened scandal which not even my resolute vigilance could wholly prevent. Some young men, able to live abroad, desired to obtain commissions in the London office without coming home, or without going to sea. I said, "No," emphatically, but in the same message authorized the employment of all clerical help needed. Commissions in class 4, I directed, should be reserved for experts, accountants, and men of demonstrated fitness, and not handed out either in London or in the United States to young men without expert knowledge. I shall come to that more fully.

In the early days of his stay in London, the officers sent to London may not have constituted a large American staff as to numbers, but the department knew that, in addition to the American officers on duty in London, Admiral Sims had all the staff needed from the British Navy to assist him in securing the information he might need. It may be open to question whether a mistake was not made in accepting for a few weeks the assistance of the British staff, but as it had been voluntarily tendered and as we wished the closest cooperation with the British Navy which had been in the war three and a half years, I saw no impropriety in accepting their tender of a "special staff appointed to give him the results of the whole naval work since the war began."

That tender and its acceptance did not make a large American naval staff at once essential. It may be interesting, in view of the repeated criticisms of the department that it did not send to London at once, where there was no fighting—and please underscore that, "where there was no fighting," in London—a staff as big as Pershing had in France, where the war was to be won or lost—and emphasize that, "where the war was to be won or lost," and not in London—to understand why it was unnecessary, while Admiral Sims was acting in no capacity except a confidential liaison officer, to read to the committee the cablegram of Ambassador Page conveying the tender of a "special staff" when the American admiral should reach London. Under date of March 22, 1917, Ambassador Page sent the following message from London:

Mr. Balfour has shown me the informal suggestion conveyed by the Navy Department regarding closer naval relations and his reply.

By way of parentheses, I may say that we were planning to cooperate before Sims ever heard of it, as this shows. Ambassador Page then goes on to say:

The British Government will heartily fall in with any plan we propose as soon as relations can be established. It was intimated to me that a submarine base on the coast of Ireland would then be assented to.

The whole plan and the best method to bring it about have been informally discussed by me with Mr. Balfour, Mr. Bonar Law, and the prime minister, Admiral Jellicoe, and others, and they most gladly assent to any proposals that we are likely to make. I know personally and informally that they hope for the establishment of full and frank interchange of information. Knowing their spirit and their methods, I can not too strongly recommend that our Government send here immediately an admiral of our Navy who will present our plans and inquiries. The coming of such an officer of high rank would be regarded as a compliment, and—

Listen, gentlemen—

he would have all doors opened to him and a sort of special staff appointed to give him the results of the whole naval work since the war began.

In a private conversation with me to-day, Mr. Balfour expressed enthusiastic hope that such a plan would be immediately carried out. Many things of the greatest value

would be favorably made known to such an officer which would never be given in a routine way nor reduced to writing. If our Navy will send an admiral it will be advantageous for me to be informed as soon as possible.

On April 6, Ambassador Page sent a message saying the British Government would instantly place experts to cooperate with the United States in all matters.

About that time the General Board decided to recommend that an admiral should be sent to London, and suggested that Admiral Sims should go to study conditions and make report. Within a few days of the receipt of the above message from Ambassador Page, it was decided to send Rear Admiral Sims to London in accordance with the understanding with Mr. Balfour and upon the suggestion of Ambassador Page. Admiral Sims was summoned to Washington, acquainted with the above message from Ambassador Page, and he sailed before the end of March.

The department, knowing he had three American officers of ability in London, with plenty of civilian help, and authority to employ just as many more as he needed, and assured that the British would furnish "a special staff to give him the results of the whole naval work since the war began," can not be severely criticized because it did not immediately comply with his request for a big staff of experienced officers sorely needed here to do more important work than was then necessary to do in London at that time. This feeling of the department was heightened and justified particularly when, in his telegrams sent soon after his arrival, Admiral Sims asked to have sent to him at once Capt. Pratt, Assistant Chief of Operations; Commander Pye, on the staff of Admiral Mayo, commander in chief of the Atlantic Fleet; Commander Belknap, of the staff of the Chief of Operations; and like officers whose duties in Washington were many times more important than any duties in London at that time. I wish that the Bureau of Navigation could have sent him with great celerity all the officers he desired. The officers of the bureau have shown you by testimony and Capt. Laning by letter to Admiral Sims that the demand upon them for officers of long experience was greater than the bureau could supply.

Let us see how well the bureau did send him a staff, even though in the first few months it knew the British Admiralty had volunteered to assign him "a special staff to give him the results of the whole naval work since the war began." That was the very information the department wanted and I have never heard that the British Admiralty failed to furnish the staff and assistance they volunteered through Ambassador Page to supply. If they failed, the admiral never notified the department of their failure. Officers of the Bureau of Navigation have come before your committee and testified that, in addition to the three officers and all the civilians he wished to employ, and his special British staff, they sent Commander Daniels over early in the war. By July 1, 1917, we had seven officers in London; Sims had been given authority to detail excess officers from the ships sent over, and his staff grew until he had in October, 1917, 18 officers and by November, 1918, he had 179 officers and 373 men on duty in London. If he had too few Americans on his staff in the early part of 1917, he had so many in 1919 and the number had grown to such large proportions that there was a feeling that he had as much too many in 1919 as he says he had too few in the spring of 1917. He

was not only, therefore, supplied in the summer with a small staff of selected American officers, but inasmuch as in addition the British Admiralty gave him all the information at their disposal through the "special staff" tendered, I can not see where so much is made of the lack of staff except that Sims seems to think he should have been given as large a staff at first as Gen. Pershing had when the Army general first went to France.

When Pershing went over he was to command the American Army which grew to 2,000,000 men, for which he was to immediately make plans and provide all things needful for them. When Sims went over he was on a special confidential mission and neither he nor anybody else then supposed he would have any other duty abroad. As the destroyers went over in April, May, and June (34 out of our total of 50) they were all placed under British operation; Admiral Sims, therefore, in fact never during the war commanded ships or fleets, but was a liaison officer, or rather his position was that of assistant to the Chief of Operations assigned to duties overseas, just as Capt. Pratt was assistant to the Chief of Operations assigned to duty in Washington. This does not mean that his duties were not important (for Capt. Pratt here and Admiral Sims abroad had duties of great importance), or that he was not diligent in discharge of the duties he performed under the direction of the Secretary of the Navy or the Chief of Operations. His designation as force commander gave him no such duties ashore as a commander in chief, for it was always the policy of the department that when the fleet went abroad (and it was expected that conditions would arise by which the fleet should act as a unit), it would be commanded by Admiral Mayo, the commander in chief, and not by Admiral Sims.

This statement is, I submit, a complete and perfect answer to the criticisms of the department with reference to staff assignments.

Talking about adequate staff, gentlemen, that complaint of Admiral Sims amounts to little, as has been shown, but recently I have been looking over Admiral Sir Reginald Bacon's book, *Dover Patrol, 1915-1917*, and quote this extract found on page 507:

Another point that requires considerable attention in peace time is to adjust peace ideas to war conditions. Witness the refusal to appoint Capt. Bowring and then Capt. Evans as chief of my staff because of some musty precedent; the fight I had to make to get the captain in charge of destroyers accommodated in his own office ready at night for instant call.

It seems that admirals of other nations across the sea also had trouble about their staffs, and that it was not only the Navy Department at Washington but also the British Admiralty at London that did not turn rubber stamps and do everything that admirals requested. Sims said in his hearing before your committee that members of his staff "are convolutions of my brain," and he clamored and clamored for more "convolutions" until he had over 200 officers in London, where there was no fighting.

ADMIRAL SIMS COMPLAINS BECAUSE NOT ALLOWED TO SELECT FLAG OFFICERS.

Admiral Sims complains vigorously and repeatedly and with show of feeling because he was not allowed to select the flag officers in European waters. He said in a telegram on September 30 that some who had been sent by the department "are not in sympathy with my

methods." I do not know about "my methods" but they were in sympathy with the department's methods and carried out the department's policies and believed more in the American policies than the policies of any other country, something which Sims did not always do. It was the policy of the Navy Department which was to be carried out, not "my" (Sims's) "methods" or policies, and he had no right to expect to dictate such assignments.

It is quite true that the department did not delegate Admiral Sims, in his London headquarters, the right to name flag officers for the more important tasks abroad. His "methods" would not have placed and kept in important positions all the men selected by the department who performed duties ashore and afloat which gave distinction to the Navy. I assume responsibility, after conference with the Chief of Operations, for the selection of the admirals charged with important duties abroad as well as at home. They were loyal to the American Navy, Rodman in command of the North Sea Squadron, operating cordially under Admiral Beatty of the British Navy; Wilson in command of destroyers and other craft on the French coast and safeguarding hundreds of thousands of American troops to France; Admiral Niblack in charge of American operations in the Mediterranean; Admiral Strauss who had charge of the great work of laying the mine barrage across the North Sea; Admiral Dunn, who was in charge of the naval base at the Azores, established in opposition to the advice of Admiral Sims; and the other admirals whose excellent work is deserving of all praise. They were selected by the department; and the result of what was done more than justifies the wisdom of the department.

Admiral Sims makes the mistake of complaining that he was not intrusted with powers never contemplated being given to him when he criticizes the department for not giving him the powers he coveted of naming all flag officers abroad. The truth is that, though they reported through him and were under him in the same sense that he was under Mayo, his idea that the same rule should have prevailed as if he were the commander in chief of the fleet has no foundation in fact.

He says the department departed from sound military policy in not giving him powers of a commander in chief. He was not given such power because he was never commander in chief, but, though called "force commander," really exercised no important duties except such as inhered in a liaison officer and representative of the department for such duties as were specifically given him by the Secretary of the Navy and the Chief of Operations. Never for a day did the Chief of Operations divest himself of the responsibility imposed upon him by law or given him by the Secretary of the Navy. And at no time during the whole war did the Secretary of the Navy delegate to any officer the power to select flag officers for places of great responsibility. When selected, these flag officers exercised their duties with as free a hand as Operations deemed fitted in with the whole naval policy.

The only thing that counts in the acid test is results. The results abroad of the service of flag officers selected by the department attest the wisdom of their selection. They were directed to carry out the department's policies along the methods approved by the department in the great matters involving large cooperation. In all other

duties—and that embraced nearly all their duties—they were free to follow their own judgment. The results prove that no mistake was made by the department in selecting the flag officers abroad instead of giving that power to the force commander in his office in London. It would have been a military mistake to have given this power which he coveted and which he complains was withheld from him.

SIMS'S ATTEMPT TO DISTURB OUR FRIENDLY RELATIONS.

In addition to the condemnation of the people of his act in giving publicity to a letter containing what he called an "explicit admonition," which he could not have disclosed except by violation of confidence, there is another reason why the American people will not forgive this act of Admiral Sims. That reason is because it was either its evident purpose to convey to our associates in Great Britain the impression that responsible naval authority in Washington had such prejudice against Great Britain as to deny our immediate and whole-hearted contribution to victory, or would permit any critic or enemy of the United States to reflect upon America's full and efficient participation in the naval operations, and quote Admiral Sims's statement as authority for such unjust and unworthy reflection. This wrong and injustice can never be forgiven a naval officer intrusted with confidential and important duties representing the American Navy abroad. Whatever other verdict may be rendered by the great jury of one hundred and more million citizens of the United States (and that is the jury which will pass upon matters discussed in these hearings) as to this or that issue raised, there will be no division anywhere in the vote of condemnation for this action.

COMRADESHIP OF ALLIED NATIONS GLORY OF THE WORLD WAR.

An outstanding glory of the World War on sea and land was the comradeship of soldiers and sailors of the United States and their shipmates and comrades of the allied and associated nations. Naturally before the United States entered the war we had only partial information of the policies and acts of the allied nations, but as soon as Congress, upon the recommendation of the President, declared that a state of war existed between the United States and the Imperial German Government there was the freest and fullest interchange, not only of opinion and information, and the closest fellowship followed. Indeed before we entered the war, when diplomatic relations with the Imperial German Government were broken, on February 2, 1917, plans were making here and abroad for immediate cooperation as soon as Congress should act.

Upon the direction of the President, who was in close touch with conditions overseas, the Navy, in March, two weeks before we entered the war, placed armed guards on all merchant ships and it was determined to send Admiral Sims to England to be the agent of the department to secure all information the Navy would desire when war was declared, and before he arrived we held conferences at Hampton Roads and Washington with Vice Admiral Browning, of the British Navy, and Admiral Grasset, of the French Navy, and perfected working arrangements. We knew full well that, while our Navy would work in perfect fellowship with the navies of other allied

countries, by reason of the greatness of the British Navy and the big task it had assumed on the sea, our chief naval cooperation would be with that navy. It was because of this knowledge and our earnest desire to lose no time in possessing all the information their long participation in war would enable them to furnish that Admiral Sims was sent to England before war was declared. He had, of course, to go as a neutral from a neutral country, but we had been assured by the American ambassador at London that the coming of an American admiral would be welcomed, all sources of information opened to him, and that the Admiralty would furnish him "a sort of special staff."

The Navy Department sent Admiral Sims as its representative to establish and maintain the most cordial relations between our Navy and the British Navy. That was his mission. If anybody in authority in the department had entertained "idiosyncracies" or prejudices against Great Britain, or had been unwilling to work whole-heartedly with that great naval nation, he would not have favored sending Admiral Sims with his well-known pro-British "idiosyncrasies" as the department's representative to Great Britain. That is the irrefutable answer to the suggestions and intimations of any lack in desire for the closest understanding and cooperation. Admiral Sims, by reason of his known great friendliness to naval officers in Great Britain and to that country, did do what the department desired abroad, to wit, cooperate heartily with our British allies. It was to be friendly and hearty cooperation, however, between equals, but no consolidation, or no subserviency of one to the other that either country desired or would tolerate. The same spirit of earnest working together and fellowship existed in Washington, where Admiral Benson, Chief of Operations, Admiral McKean, Chief of Material, Capt. Chase and Capt. Pratt, his chief assistants in Operations, and all other officers in the Navy Department were in intimate touch and daily conference with Admiral Lowther Grant, Commodore Gaunt, and other British naval officers sent by the British Admiralty to Washington for the same purpose we sent Admiral Sims to London, which was to secure prompt exchange of information and views and to cooperate in every possible way. We had the same intimate relations with the naval representatives of the French, Italian, and other allied nations, who sent representatives to Washington.

In addition, from time to time, we had important conferences with the distinguished members of the mission embracing the most eminent men in diplomatic, war, and navy departments of allied nations, who came to Washington for conferences with the President upon matters of higher importance than those intrusted, for example, to Admiral Sims, who represented our Navy in London, or Admiral Grant, who represented the British Navy in Washington. The naval members of the mission laid before us the conditions in their country. From them we had first-hand knowledge of how we could best help the joint cause in the North Sea and in the Atlantic, on the French coast, in the Mediterranean, in the Gulf of Mexico and Caribbean Sea, where the protection of the oil supply was justly regarded as of the utmost importance. We had from Sims in England, Fletcher and Wilson in France, Wilson and Niblack in the Mediterranean, and other naval officers abroad all the information they

could obtain, and it was most valuable, but from the distinguished naval officers and cabinet officers composing these missions, such men as Balfour and Joffre, the greatest men in all the nations, we obtained the larger policies, the greater problems, and were enabled to understand better the mission of the Navy as it related to the whole national and international duty and opportunity than we could obtain it, for example, from Admiral Sims in London, Admiral Wilson in Brest, and Admiral Niblack in Gibraltar. Their reports gave us the naval point of view. The conferences with the members of the several missions gave us the whole point of view. Putting them together, the department was enabled to see the whole big naval mission and to act upon it, whereas every naval representative abroad was naturally and unconsciously more or less influenced by the conditions of the country and the opinions of the admiralty in the country, where he made his headquarters.

It will be necessary, as a matter of justice to the United States Navy, which has been charged with failure to act with more expedition in the first few months of the war, to contrast the bold and audacious policies we presented and urged, with the delay in some of those great projects caused by Admiral Sims's opposition, and the lack of faith in the practicability of some of them by the British Admiralty. This is not done in any spirit of criticism of the British Admiralty or the British Navy. The navy of that nation did a great work, and if it was slow, as it was, to undertake the laying of the barrage in the North Sea and to close the English Channel to the submarines, which proved to be the great outstanding contribution of the war; if, I say, they were slow to adopt and help carry out those projects we deemed so important, the British Admiralty and the British Navy did other great tasks in so great a way as to be worthy of the appreciation of the whole world. Our officers and our men felt that they were truly shipmates, during the war, of their British associates. But they were not closer in spirit and more devoted in effort and more united in determination to win than were the officers in the Navy Department at Washington and in the Admiralty at London. Admiral Benson and his associate officers in Washington were daily in as close touch with the British officers in Washington as were Admiral Sims and his associates in London with the British Admiralty. Our British associates freely and frankly told us they had learned by their mistakes, and we gladly adopted their suggestions and thereby avoided mistakes we might otherwise have made.

Our British associates were free to admit their mistakes. They made mistakes and so did the American Navy. There was never a war in which there were not errors of judgment and division of opinion. There never will be until the superman commands all forces. But at no time during the war was there disposition in this country to criticize the British mistakes or in that country to criticize American mistakes. Both navies, in counsel and afloat, were consecrated to their work and each gladly availed itself of the lessons taught by the mistakes of the other to increase the effectiveness of the joint naval contribution which helped to win the war. In mutual cooperation ashore and afloat and in the united sacrifice of men of both nations there came mutual esteem and fellowship. Let it be perpetuated in mutual cooperation for the victories of peace.

Let me add one more thought. You have heard many great admirals of the American Navy testify that Admiral Sims's attacks upon the work of the American Navy during the war are either wholly unwarranted or grossly exaggerated. If you could have appear before you similarly the great admirals of the British Navy you would not find one who would admit that the American Navy was responsible for the prolongation of the war for four months and the unnecessary loss of 500,000 lives. I have talked with many of these gallant gentlemen and they could not speak as they did of the American Navy if they felt that Admiral Sims's charges had any warrant in fact.

COOPERATION AND COMRADESHIP BETWEEN BRITISH AND AMERICAN NAVIES.

From the beginning to the end of the World War there was the most perfect cooperation and comradeship between the American and British Navies. The Navy Department originated this cooperation on the part of our country before any message had been received from Admiral Sims, and it was put into effect immediately after Congress declared war.

As soon as Congress declared war, we got in touch with the British and French admirals on this side of the Atlantic and within five days a formal conference of allied representatives and our naval authorities was held in the room of the General Board. As a result of that conference, verbal orders were given to send a division of destroyers to Great Britain, in addition to taking over the patrol of this coast from Halifax to Brazil. The first order issued to any American forces for European service after the United States entered the war was the following:

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, D. C., April 14.

Secret and confidential.

To: Commander Eighth Division, Destroyer Force, Atlantic Fleet, U. S. S. *Wadsworth*, flagship.

Subject: Protection of commerce near the coasts of Great Britain and Ireland.

1. The British Admiralty have requested the cooperation of a division of American destroyers in the protection of commerce near the coasts of Great Britain and France.

2. Your mission is to assist naval operations of Entente Powers in every way possible.

3. Proceed to Queenstown, Ireland. Report to senior British naval officer present, and thereafter cooperate fully with the British Navy. Should it be decided that your force act in cooperation with French naval forces, your mission and method of cooperation under French Admiralty authority remains unchanged.

Route to Queenstown: Boston to latitude 50 N., long. 20 W., to arrive at daybreak, then to latitude 40 N., long. 12 W., thence to Queenstown.

When within radio communication of the British naval forces off Ireland, call G CK and inform the vice admiral at Queenstown in British general code of your position, course, and speed. You will be met outside of Queenstown.

4. Base facilities will be provided by the British Admiralty.

5. Communicate your orders and operations to Rear Admiral Sims at London and be guided by such instructions as he may give you. Make no reports of arrival to Navy Department direct.

JOSEPHUS DANIELS.

This order represented the attitude of the Secretary of the Navy, the Chief of Operations, and every official and officer in the Navy Department from the declaration of war until victory was won. A cursory reading of this history-making order shows that from the

first we invited, secured, and carried on the working together of American and British naval forces in a way which was all that could be desired.

The object set forth in this first order of the war for overseas service was the "protection of commerce near the coasts of Great Britain and Ireland."

The mission was stated to be "to assist naval operations of entente powers in every way possible."

The direction was to "proceed to Queenstown," to "report to senior British officer present, and thereafter cooperate fully with the British Navy."

That was the wise policy of the United States. That was the wise policy of the Secretary of the Navy. That was the wise policy of Admiral Benson. This order was prepared in Operations after the policy of "cooperate fully with the British Navy" had been officially determined upon by the Secretary of the Navy.

Sir Edward Carson, then first lord of the British Admiralty, in a speech on May 17, 1917, expressed high appreciation of the "speedy action of the American Navy," saying:

The toast that I have to propose is that of the American Navy. I give it to you from the bottom of my heart. The date of this particular function is very opportune. It almost coincides with the arrival in our seas of the first installment of the assistance which the American Navy is going to give us in the terrible task that is before us. It enables us who are members of our Navy League, and it enables me as for the moment presiding over the great service of the Admiralty in this country, to express and demonstrate our appreciation of the speedy action of the American Navy and to offer a hearty welcome to the officers and men who have reached our shores. * * *

I have been told, and I have received the news with great pleasure, of the great efficiency of the flotilla which has been sent over. I am told that the construction of the ships is magnificent, that their armament is perfect, and that their officers and men are also magnificent. In my opinion, no more important event in the history of the New World has ever happened than the arrival of that flotilla of destroyers in our waters, to fight side by side with our navy. The old Union Jack is to be commingled with the Stars and Stripes. It is not merely that we are fighting side by side, though that is, of course, a matter which may have far-reaching effects in the history and relations of the two great English-speaking races. It is not merely the fact of our old kinship. It is a recognition of the fact that the Old World and the New World, whatever may be the ocean distances that separate us, have one great common ideal—the love of liberty and progress and the determination to beat back the aggressor who dares to raise a hand against the fabric of the civilization which we together have built up. We are from this day forward out together to preserve the real freedom of the seas, and we mean to do it. Not for selfish reasons, not for acquisition, not at all for supremacy or domination, but for the purpose of maintaining the very elementary principles of civilization and humanity.

That the British Navy had its critics, some of them moved by petty politics, others chronic grumblers and growlers, including officers jealous of their fellows in authority, is shown by these extracts from Sir Edward Carson's address:

This is not the occasion to review either the work of the British Navy or the task which has been set before us. It would take me a long time to answer the criticisms which are sometimes passed upon the work of the Admiralty and the British Navy. Somehow or other I am so constituted that I can not get "cold feet." I can divide my critics into various categories. There are my political critics. I despise them in the middle of war. Then there are the critics who have been disappointed in the past. Whenever you read criticisms of my colleague, Sir John Jellicoe, try to find out what is the origin of them. But after all it does not really matter. There will always be grumbings and growlings. Let them grumble and growl, and let us get on with our work. The work of the Admiralty, the work of the great British Navy, is done silently and courageously. It is done in the day. It is done in the night. It is done every hour and every minute; and I can tell you this, with all confidence, that I

believe in the whole history of the British Navy there never was a time at which our men displayed greater heroism and courage than they do at the present moment.

I hope nobody imagines that I am going to deal with the submarine menace. I have only one word to say upon the subject, and that is, that I should advise you not to pay the slightest attention to those who imagine that the only people in the world who know anything about it are the Admiralty. I don't underestimate the menace. We would be fools if we did so. It is a great, a novel, and a terrible menace. It is a menace that has been unsolved by any navy—our own Navy, the German Navy, the Austrian Navy, the Italian Navy, or the American Navy—but don't imagine that you will solve it by abuse or by funk. No; the real way to look upon it is that it is a real danger, and it is the work of men to face and to solve real dangers.

In the coming months the courage and the grit of our people may be sorely tried. It may be, in the long run, a question as to which side is going to stick it out. Well, I will tell you who is going to stick it out. We are. But you will not encourage the spirit of sticking it out if, by ill-informed criticism and trying to create discontent and want of confidence in your officers, who have proved themselves in the past efficient, great, and honorable men, you level against them criticisms over matters entirely undeserved. Our duty is not to get either swollen heads or "cold feet." To go on unremittingly from day to day and hour to hour, grappling with our difficulties until they are overcome—that is the task which is before us. We, at all events, do not shirk it.

In that task, with all its doubts and dangers and difficulties, we welcome the help of the great Republic from the west. We believe that, fighting together, we are, and will be, invincible, and, in the long run, together with them and our other allies, I feel no shadow of doubt in my own mind that we will attain that victory which will not be a victory for ourselves alone, but a victory for the whole civilized world.

The CHAIRMAN. Mr. Secretary, there are certain matters which require our attendance in the Senate, and we shall therefore have to adjourn now until 10 o'clock to-morrow morning.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Tuesday, May 11, 1920. at 10 o'clock a. m.)

NAVAL INVESTIGATION.

TUESDAY, MAY 11, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Secretary Daniels, will you proceed?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. Mr. Chairman, when the committee adjourned yesterday I was in the midst of a statement as to the cooperation and comradeship between the British and the American Navies.

From the arrival of our first destroyers the most cordial relations existed between our officers and men and Admiral Sir Lewis Bayly, commander in chief of the coasts of Ireland, who commanded our destroyers at Queenstown. Admiral Sims says in one of his magazine articles (*World's Work* for November, 1919):

Not long after our destroyers arrived at Queenstown, most of the British destroyers left—

I shall come to that again, Mr. Chairman, and show why they left and how few remained in that critical area—

to reinforce the hard-driven flotillas in the channel and the North Sea, so that the destroyer forces under Admiral Bayly became almost exclusively American. The admiral watched over these ships and their men with the jealous eye of a father. He always referred to his command as "my destroyers" and "my Americans," and woe to any one who attempted to interfere with them or do them the slightest injustice. Admiral Bayly would fight for them, against the combined forces of the whole British navy, like a tigress for her cubs. He constantly had a weather eye on Plymouth, the main base of the British destroyers, to see that the vessels from that station did their fair share of the work. Once or twice a dispute arose between an American destroyer commander and a British. In such cases Admiral Bayly vigorously took the part of the American. "You did perfectly right," he would say to our men, and then he would turn all his guns against the interfering Britisher. Relations between the young Americans and the experienced admiral became so close that they would sometimes go to him with their personal troubles; he became not only their commander, but their confidant and adviser.

On the anniversary of the arrival of the first American flotilla, Admiral Bayly, on May 4, 1918, issued a general order in which he said:

I wish to express my deep gratitude to the United States' officers and ratings for the skill, energy, and unflinching good nature which they have consistently shown and which qualities have so materially assisted the war by enabling the ships of the allied powers to cross the ocean in comparative freedom.

I wish to call your attention to the fact that Admiral Bayly seemed to have a true appreciation of the greatest task for winning the war, that is "enabling the ships of the allied powers to cross the ocean in comparative freedom."

To command you is an honor, to work with you is a pleasure, and to know you is to know the best traits of the Anglo-Saxon race.

No two navies in history ever cooperated so closely.

Admiral Sims, in a letter he wrote to me from London, May 5, 1918, said:

I inclose herewith an article on the United States Navy from the American edition of Land and Water.

I invite your attention to the marked paragraph of the first page which refers to the historic significance of our method of cooperating with the navies of our Allies. The author states that "this is the first occasion in which the ships of one allied nation have been practically incorporated (as far as the direction of operations are concerned) in the navy of another. Allied fleets have carried out operations together—as the French and the British at the Dardanelles, or the British and the Italians in the Adriatic—but never has the cooperation been more intimate—and, it may be added, more successful—than in the present instance."

This was a letter written to the Secretary of the Navy, gentlemen:

I invite your attention to this appreciation of the success of our method of cooperation because there has recently appeared in a number of papers in the United States, notably, the Washington Post, the Army and Navy Register, and the New York Tribune, criticisms of this very method of cooperation which I consider very damaging to the Navy Department and to me personally, because they tend to diminish the confidence of the public in the Navy Department's methods and to diminish my authority over the forces here.

If I may be permitted to say so, it appears to me that it would be in the interests of efficiency if criticisms of the character above referred to could be promptly and authoritatively refuted by the Navy Department.

It is difficult at this distance to refute such criticisms. We do not hear about them until long after they are published. I have written, personally and confidentially, to the editors of the Army and Navy Register, and the New York Tribune, pointing out how very much in error their actual and implied statements were, and how detrimental to the cause such criticisms are.

This article treats of the harmony existing between the British and American forces and the efficient way in which they were working together as if they were parts of one service. The paragraph marked by Admiral Sims is as follows:

Because it has been impossible to tell the public scarcely anything about American naval cooperations with the British, the historic significance of that event has been almost overlooked. As a matter of fact, however, it marks the first occasion in which the ships of one allied nation have been practically incorporated (as far as the direction of operations are concerned) in the navy of another. Allied fleets have carried out operations together—as the French and the British at the Dardanelles, or the British and the Italians in the Adriatic—but never has the cooperation been more intimate—and, it may be added, more successful—than in the present instance.

ADMIRAL BEATTY'S FAREWELL TRIBUTE TO BATTLESHIPS THAT SERVED WITH THE BRITISH GRAND FLEET.

Those "Comrades of the Mist," the British and American battle-ships serving together at Scapa Flow and in the North Sea, were bound together by ties that can not be broken. Admiral Rodman and all our officers and men felt like they were serving with brothers, and our British allies felt the same way toward our own forces.

On their departure, Admiral Sir David Beatty, the British commander in chief, in an address on board the flagship *New York*, paid

this tribute to the officers and men of the American battleships which served with the Grand Fleet:

I could not let the sixth battle squadron go without coming on board the *New York* and saying something of what I feel at this moment of your departure. I had intended to ask Admiral Rodman to permit me to say something to representatives of all the ships of the sixth battle squadron on board his flagship, but exigencies of the service have not permitted me to do that, and therefore, as Admiral Rodman has said, what I say to you, I hope you will promulgate to your comrades in the other ships, and not only to them but also to your comrades of the Atlantic Fleet.

There is not much that I have to say, but what I do say I hope you will understand comes from the heart, not only my heart, but the hearts of your comrades of the Grand Fleet.

I want, first of all, to thank you, Admiral Rodman, the captains, officers, and ships' companies of the magnificent squadron, for the wonderful cooperation and the loyalty you have given to me and to my admirals, and the assistance that you have given us in every duty you had to undertake. The support which you have shown is that of true comradeship, and in time of stress that is worth a very great deal. As somebody said the other day—

This is a very interesting paragraph, Mr. Chairman—

“The fighting is now over, the talking is now going to begin”—

Admiral Beatty is not only a great fighter, but he is a prophet—

therefore I do not want to keep you here any longer, but I want to congratulate you for having been present upon a day which is unsurpassed in the naval annals of the world. I know quite well that you, as well as all of your British comrades, were bitterly disappointed at not being able to give effect to that efficiency that you have so well maintained. It was a most disappointing day. It was a pitiful day to see those great ships coming in like sheep being herded by dogs to their fold, without an effort anybody's part; but it was a day that everybody could be proud of. I have received messages from several people, offering sympathy to the Grand Fleet, and my answer was that we do not want sympathy; we want recognition of the fact that the prestige of the Grand Fleet stood so high it was sufficient to cause the enemy to surrender without striking a blow. I had always certain misgivings, and when the sixth battle squadron—

That is the American Squadron under Admiral Rodman—

became a part of the Grand Fleet, those misgivings were doubly strengthened, and I knew then—

You see, Admiral Beatty never knew it until then, when the American Squadron with Admiral Rodman became a part of the Grand Fleet—

I knew then that they would throw up their hands.

All the world knows it now.

Apparently the Sixth Battle Squadron was the straw that broke the camel's back. However, the disappointment that the Grand Fleet was not able to strike their blow for the freedom of the world is counteracted by the fact that it was their prestige alone that brought about this achievement.

During the last 12 months that you have been with us, we have learned to know each other very well; we have learned to respect each other; we know each other's faults (are there any in the Sixth Battle Squadron, Admiral?); we know each other's good qualities, and I want you to take back a message to the Atlantic Fleet that you have left a place, a very warm place in the hearts of the Grand Fleet, which can not be filled until you come back or send another squadron to represent you. You have given us a sample of the Atlantic Fleet which I think will try the Atlantic, efficient as it is—

Here is Admiral Beatty, a British admiral, says: “efficient as the Atlantic Fleet is,” and as everybody knows it was, in 1917—

very hard to reproduce. I do not know what Admiral Mayo will say to that, but Admiral Rodman will put it up to him that way.

I understand that you are now going down to Portland, where you are going to get leave—that is so, Admiral, is it not? After that, you have a duty to perform of bringing your President to these waters; and then you will return to your own shores; and I hope in the sunshine, which Admiral Rodman tells me always shines there, you won't forget your "Comrades of the Mist," and your pleasant associations of the North Sea.

This is a queer place, as you have found out, but you are not the first to find it out. There was a great explorer, Marco Polo, who after traveling over the world for 30 years, one day found himself in the North Sea, and then went home, went to bed, and did not travel any more. I trust it will not have the same effect on any of you. But I can say this for you, that those of you that I have seen during the last 12 months seemed to have improved in many ways, if it was possible; and I think that the North Sea has a health-giving quality which must be put against all the bad points, of which there are so many.

I thank you again and again, for the great part—

Admiral Beatty does not deal in hyperbole—

for the great part the Sixth Battle Squadron played in bringing about the greatest naval victory in history. I hope you will give this message to your comrades: "Come back soon. Good-bye and good luck."

I believe I expressed the feelings of the entire United States Navy, and I may add of all the allied peoples, when on the eve of the review at New York, December 26, 1918, which greeted the returning battleships, I said:

In welcoming home the powerful American dreadnaughts which have been engaged overseas during the war, the American people will greet the officers and men with pride and congratulations. These powerful ships, the equal of any in the world, in cooperation with the British Fleet, gave such predominance of sea power in the North Sea that the German Fleet dared not invite suicide by coming out and offering battle. They did not try conclusions because they knew there never was a fleet in being that could have had a chance of victory against the British and American Fleet, working together with the same signals and the same strategy as if they were the naval power of a single nation. Their mission was as single as if they had represented only one instead of the two great English-speaking nations. Their united service typified and cemented the ties between our country and Great Britain. Their silent vigils protected commerce, secured safe passage of troops and supplies, and effectually bottled up the German Fleet, rendering it as impotent for harm as if it had never been constructed.

Sea power once again demonstrated its primacy in making land victories possible. While the American dreadnaughts, an important part of the world's strongest armada, were not given an opportunity to win a great sea victory, they did more; they cooperated in receiving the surrendered German Fleet, which capitulated to the superior force of the allied fleets, and they will be received at home with all the honors given to valiant victors.

TRIBUTE BY SIR ERIC GEDDES TO THE DISTINGUISHED SERVICE OF THE AMERICAN NAVY AND THE COMRADESHIP AND COOPERATION OF THE BRITISH AND AMERICAN NAVY.

In the fall of 1918, Sir Eric Geddes, First Lord of the British Admiralty—the same position in Great Britain as Secretary of the Navy of the United States—accompanied by distinguished British naval officers, visited the United States and spent some days in conference with the Secretary of the Navy, the Chief of Operations, and other naval officers charged with responsible duties. It was a helpful conference of men of two great English-speaking nations united in a great struggle. It was carrying on the same interchange of views begun in April, 1917, when British and French Admirals and naval officials in Washington agreed to the fullest and heartiest cooperation of naval effort in the mutual service to which those countries were dedicated. There was no time when this cooperation was not perfect from the beginning to the end of the war. After

days of conference where all matters were discussed, which could aid in winning victory, Sir Eric Geddes made a statement of appreciation of the American naval forces abroad and our mutual gratification in the hearty spirit of understanding and working together which characterized the men of the navies of both countries.

The statement of Sir Eric Geddes illustrates the estimate well-informed statesmen placed upon our American ships and American efficiency. I wish to emphasize that. It illustrates the estimate which well-informed British statesmen and I will say British sailors,—too, because I talked with many of them last April in Great Britain—placed upon our American ships and American efficiency. The statement was as follows:

In speaking of the United States naval forces I do so with the great advantage of having seen most of them personally in the course of the last 18 months, and I can assure the public that the morale and efficiency is absolutely on the top line. Not only is the keenness, technical skill, and organization of the personnel truly remarkable, but, further, the material of all ships and their equipment is of the highest efficiency and latest design.

Now, this is the statement made by the first lord of the Admiralty of Great Britain. I will read it over again:

Not only is the keenness, technical skill, and organization of the personnel truly remarkable, but, further, the material of all ships and their equipment is of the highest efficiency and latest design. What applies to your fighting ships applies also to your depot and parent ships, and I think I may say, without giving offense to the great naval services of the two countries, that the intermingling and cooperative working is giving opportunities, which both services are taking, of picking out examples of the best for adoption in and by the other service.

I am, of course, unable to disclose any details of the numbers of your vessels operating abroad, but with the permission of your Navy Department I may say that they comprise some of the largest capital ships as well as cruisers, destroyers, submarines, chasers, and many types of aircraft.

Taking these various classes in turn, I would like first of all to show you that your battleships are working with our own Grand Fleet with the most perfect coordination and efficiency—

He does not say this is what he heard, but he says “I would like to show you”—

and I had the very great pleasure of witnessing their arrival when they first joined up with our own Grand Fleet, and was able to make a signal of welcome to them on that occasion.

As regards your cruisers, they are working with us in the White Sea, North Sea, Atlantic, and the Mediterranean, and I have seen them and admired their efficiency in all these places. It is to them, as well as to the gallant destroyers, working with the corresponding forces of all the Allies, that the success of the convoy system is due. It is the convoy system which balked Germany when she adopted avowedly the inhuman and ruthless method of submarine warfare, considered inconceivable and contrary to all the traditions of the sea before the war, but which we now accept as one of the outward signs of the devil which has to be exorcised before Germany is fit to take her place as an honorable member of the League of Nations, in whatever form that oft-discussed organization may finally shape itself. Germany reckoned to end the war last year by cutting the sea communications of the alliance and by the reduction in tonnage; the dissatisfaction of the German nation with result of their criminal effort is due in great measure to the convoy system, but it is also due to the allied efforts to trap and hunt the submarine on passage and to harass it on station, and these two functions in submarine warfare must not be confused.

The ocean convoy is primarily a defensive organization, and secondarily only an offensive organization. Its complement in this new form of naval warfare is the hunting flotilla and mine field. These two measures must be carefully balanced and the relative urgency of the demands of one or the other must receive, and does receive, the most urgent consideration and ceaseless care and adjustment of the great naval officers who are charged with that responsibility. At the present moment the

United States and Great Britain have become the main base of supply for the armies of Europe, and in order to insure these lines of communication being safeguarded and kept open, very efficient naval protection is required. The large proportion of merchant shipping which brings these supplies must necessarily be American and British, and consequently the Anglo-American zone of naval operations—which may be considered to include the Atlantic, North Sea, and British coastal waters—is therefore the area with which we are most vitally concerned at the present moment, though, of course, the American and British forces are helping to police the trade routes of the Mediterranean also, in conjunction with our French, Italian, Japanese, and Greek allies, whose work and cooperation is altogether admirable. In that service a Brazilian naval contingent is on the point of taking part.

Turning now to your destroyers, I know that you all appreciate what demands the present conditions of sea warfare impose upon this type of craft. Day and night, winter and summer, they scour the sea, either hunting the submarine or keeping careful watch over the valuable human lives, equipment, and transports entrusted to their care to escort. I have both traveled in and been escorted by American destroyers and I know their high standard. They are an essential part of the fighting strength of the fleet, and together with the cruisers they are the watch dogs of the allied trade and terror of the U-boat. It will convey some idea of the strain imposed upon the vessels and their crews when I tell you that each American destroyer in European waters steams between 4,000 and 5,000 miles a month. For hard work, constant vigilance, and almost perpetual discomfort this record is hard to beat, even in this great war of universal strain and hardship. In the friendly rivalry which exists the British destroyers try to beat it and yours again try to top the record.

What I have said of the destroyers applies in no less degree to your submarines—

And our submarines were doing very good work across the sea—and chasers.

And our chasers were sinking enemy submarines.

Their untiring and constant harrassing of the enemy has helped to bring the enemy submarine to its present position, in which we can confidently say that it is now held, though not yet mastered.

This was in October, 1918.

I lay great stress on these words. A great renewed effort on Germany's part is impending. We know it and of its extent. We face it with that knowledge, and with the steadfast courage of our seamen it will be met.

What your ships of all classes are doing on and under the surface your aircraft in no less degree are accomplishing in their own element, and among all the instruments of war which are combining to make the life of the undersea pirates intolerable, there is none which causes them greater anxiety and discomfiture than the constantly vigilant aircraft.

So far I have given a very brief outline of what your various units are engaged upon, but in order to gauge the fruits of their labors just bear this one fact in mind. During the last three months seven American soldiers and their equipment have arrived in Europe every minute of the day and night, and their maintenance on top of that. That is the formidable fact which the enemy has to face, and that is the result of the exercise of sea power by the alliance, to which the American naval forces are so ably contributing.

It is a great tribute to American shipbuilding and to your enterprise that you are now able to carry more than half of these troops in your own vessels built in your own country and manned by your own men. Thanks to the merchant marine of the Allies, who with a skill, unflinching courage, and pertinacity which we can not adequately extol, we have been able to maintain those sea communications without which our man power, our munitions, and our food supplies would have been disintegrated and paralyzed.

The record of the seaborne traffic of the alliances is the clearest proof of the value of sea power about which your great naval historian, Rear Admiral Mahan, wrote so emphatically and prophetically, but this result has only been sustained by the splendid heroism and endurance of the seafaring men, whether of the fighting forces or of the Mercantile Marine.

To have had the opportunity of visiting your country in the great war is the very greatest honor and pleasure to Vice Admiral Duff and myself as representing the British Board of Admiralty—

This is the first lord of the British Admiralty, rejoicing in the glorious thing that the American Navy had done. This was the

1st of October, 1918, about. He came about the last of September. I will get the exact date.

The CHAIRMAN. This is the entire speech, is it, that he made?

Secretary DANIELS. I think it is.

The CHAIRMAN. There is nothing left out?

Secretary DANIELS. I am not certain. (Continuing reading:)

and it is an added pleasure to us that we have come at a time when the allied forces are winning all along the line, and when we are reaping the fruits of the sound naval strategy and the overwhelming sea power of the allied nations, but I have made it the keynote of all my policy and of all my advice to others not to be deluded with hopes of an early peace, but to prepare for an ever-receding duration of the war. We must always be prepared for two years more, and then only shall we have the sure means of the final victory in our hands.

October, 1918, this was.

I can not close this very brief appreciation of the magnificent work which is being undertaken by the United States naval forces operating in European waters without expressing on behalf of the Board of Admiralty and the Royal Navy our affection, in many cases personal, and our admiration of your officers and men who side by side with us and the other Allies, are keeping open the sea communications of the alliance; are reducing the enemy's fleets to impotence; and have driven his commerce from the seas. One of the most striking visible manifestations of the unity of purpose and the unity of method which I have had was afforded me when at the request of Admiral Benson I stepped from his room at the Navy Department into the chart room, where the great charts of the world show the allied naval situation at a glance.

It was unnecessary for me here in Washington to ask for explanation. I had seen such a chart in every detail upon the walls of the British Admiralty a week ago, possibly a month before that a similar one on the walls in the French Ministry of Marine, and some months before that on the walls in the Italian Ministry of Marine. Representatives of each of the allied navies are at home and welcome comrades in every other admiralty. None of the navies do much talking, but among themselves they talk the same language. They share the same dangers, they undertake indiscriminately the same responsibilities, according to the whole power behind the controlling chief of staff in each country. Since the beginning of the war the British Navy has escorted overseas to and from all theaters of war some 16,000,000 men belonging to the armies of the British Empire—

Most of them were escorted only across the English Channel, a run of an hour or two—

and the loss has been one-thousandth part of a man per hundred carried, from all causes—marine risks or enemy action—and it is our purpose and our pride to maintain and reduce that percentage in the great flow of your manhood across the Atlantic. You have had losses at sea, and you will have more losses at sea. I know that they will be faced with the fortitude shown by all the Allies in this great struggle or right against the wrong and based upon the justice of our cause and the inflexibility of the allied purpose.

I venture the opinion that when the history of this war is written there will be no more glorious page in that history than the one which tells much that to-day can not be told of the work done, the dangers faced, and the privations endured by your Navy in common with the navies of your cobelligerents, and there will be no greater manifestation of the overwhelming importance of sea power in a fight such as this has been. In that manifestation the great American Navy—the third largest in the world—played a highly honorably and increasingly important part, and it has been to myself and Admiral Duff a great honor to confer in person with the great chiefs of the Navy Department.

Prior to the publication of this statement Sir Eric Geddes on October 7 received the Washington correspondents and gave them the following statement for publication:

My visit to the United States of America in company with Vice Admiral Duff, the assistant chief of the naval staff of the Admiralty is in response to a most cordial invitation extended to us by the Secretary of the United States Navy. Mr. Daniels intimated to me recently that a visit of representatives of the British Board of Admiralty to discuss certain matters concerning the naval situation would be very wel-

come to the Navy Department and himself, and it is in this capacity and for this purpose that we have come over.

In the past we have had the great advantage of receiving in our country distinguished United States naval officers and high officials, and we know how valuable are these opportunities of close consultation. It is, therefore, a great pleasure to us and a source of keen satisfaction to have been invited to visit your country and confer with your administration.

Personally I have the added pleasure of renewing my acquaintance with the United States of America, where as a young man I spent some strenuous years learning lumber and railway work and making many good friends.

For the last 18 months we on our side have had the opportunity of seeing your Navy at work, and I am voicing the opinion not only of the Royal Navy and the British Nation, but of the whole of the Allies when I say that your sailors, no less than your gallant troops, have won our deepest admiration.

Seamanship, technical skill, endurance, ingenuity, and good fellowship—all of those we know we could expect from the United States Navy, and it is those very qualities in a degree far exceeding our anticipations which have endeared your officers and men to us all and have brought about that complete unity of spirit and purpose between the two great navies to which the present visit of the Board of Admiralty bears testimony.

The dauntless determination which the United States has displayed in creating a huge trained body of seamen out of landmen is one of the most striking accomplishments of the war. Had it not been effectively done one would have thought it impossible, and words fail me to express our admiration of this feat undertaken and accomplished by your Navy Department, of which Mr. Secretary Daniels is the civil chief.

The kindness of the invitation and the cordial and hospitable welcome of the President, Mr. Lansing, Mr. Daniels, Admiral Benson, and all other representatives of your great country whom we have met has touched us deeply, and my colleague Vice Admiral Duif and all of our party most gratefully acknowledge it.

This statement does more than attest appreciation; it shows the close and friendly cooperation, which began when the United States entered the World War, existing between the navies of the two great English-speaking nations.

The CHAIRMAN. Mr. Secretary, this is a fine tribute to the American Navy, but it does not especially deal, apparently, with the first six months of the war.

Secretary DANIELS. Mr. Chairman, I understand that the rule of the committee is that I shall finish my statement without interruption.

The CHAIRMAN. Yes, but I want to make a suggestion. If there is anything more which is not included in the statement here, I wish you would have it inserted in the record.

Secretary DANIELS. I will. I think it is all there, but if it is not, I will put it in.

THE PRESIDENT'S INSISTENCE UPON NEW AND BOLD PLANS OF NAVAL WARFARE.

The policy of the Government with reference to naval preparedness was expressed more than a year before we entered the war in a single sentence by President Wilson, the Commander in Chief of the Navy, when on the 3d day of February, 1916, in a speech at St. Louis, he declared:

There is no other navy in the world that has to cover so great an area of defense as the American Navy, and it ought, in my judgment, to be incomparably the most adequate Navy in the world.

This was the public declaration of a policy which, with the approval of the President, had been set in motion by the Navy Department.

after conference with the President, six months before the above declaration was made. In July, 1915, I had directed the General Board to make a study and to express its opinion to the department "as to what the Navy must be in the future in order to stand upon an equality with the most efficient and most practicably serviceable," and to submit—

a program * * * formulated in the most definite terms * * * planned for a consistent and progressive development of this great defensive arm of the Nation.

In compliance with this order, the General Board laid down this policy:

The Navy of the United States should ultimately be equal to the most powerful maintained by any other nation in the world. It should be gradually increased to this point by such a rate of development year by year as may be permitted by the facilities of the country, but the limit above defined should be attained not later than 1925.

As a matter of fact, I may say in parentheses that the program already authorized and being carried out will give us such a Navy before 1925; in fact, it is already authorized and recommended by the Secretary of the Navy and the General Board.

The CHAIRMAN. It is not already authorized by Congress?

Secretary DANIELS. I say it is already authorized and recommended by the General Board and the Secretary of the Navy. Congress has not yet authorized it, but I hope it will.

In the annual report of the Secretary of the Navy on December 1, 1915, I began the report with these words:

I feel it my duty to urge above everything else the necessity of the adoption by Congress of a continuing program of construction.

And added:

For the first time in the report of a Secretary of the Navy a plan is submitted which covers not only the necessities of the immediate future, but has been extended to cover a period of five years. Planning to-day what we will begin to-morrow in order to have it completed in the future is the essence of all true preparedness.

I foresaw in 1915 the necessity of action to save the waste of war, and said in that report:

Nothing is to be gained by the expenditure of millions of dollars in the haste of threatened war or in the panic of actual war.

This is conclusive evidence that the Navy Department long before war was declared was alive to the importance of preparedness and was taking every step toward that end.

In his message which he read to Congress and emphasized, President Wilson said of the continuing program (December, 1915):

The program which will be laid before you by the Secretary of the Navy * * * involves only a shortening of the time within which plans long matured shall be carried out; but it does make definite and explicit a program which has heretofore been only implicit, held in the minds of the Committees on Naval Affairs and disclosed in the debates of the two Houses but nowhere formulated or formally adopted. It seems to me very clear that it will be to the advantage of the country for the Congress to adopt a comprehensive plan for putting the Navy upon a final footing of strength and efficiency and to press that plan to completion within the next five years. We have always looked to the Navy of the country as our first and chief line of defense; we have always seen it to be our manifest course of prudence to be strong on the seas. Year by year we have been creating a Navy which now ranks very high indeed among the navies of the maritime nations.

Then the President, after detailing the size and power of our Navy when the program proposed should be completed, concluded his address delivered in person to Congress with these words:

This would be a Navy fitted to our needs and worthy of our traditions.

On October 7, 1915, I directed the General Board to prepare—

a building program for the Navy that will continue over a period of five years, with an expenditure of about \$100,000,000 each year for five years, on new construction only.

In compliance with that direction the General Board made recommendations for a building program practically as embodied in the act of August 29, 1916.

I beg to call your attention to this recommendation, which began with my letter to the General Board in July, 1915, and with my explicit direction to the General Board, of October, 1915. I made a few changes from their recommendation in my estimates to Congress, asking for 15 fleet submarines, whereas the General Board asked for 9, and for 85 coast submarines against the 58 recommended by the General Board. My total was \$502,482,214 as against the General Board's estimate of \$499,876,000, a very slight difference. As a matter of fact, owing to the increased cost of construction, the program when completed will cost nearer \$800,000,000 than the estimated \$500,000,000.

Approving my suggestion of a continuing program, the General Board said (see report of 1915):

5. The General Board is convinced of the great advantages, both military and economic, which will follow upon the acceptance of the general principle of a building program extending over a period of years. This is the first time that any administration has decided to present to Congress a continuing shipbuilding program. On one hand a continuing program enables the Navy Department to plan with greater foresight than is possible with an annual noncontinuing program. The military end to be reached at the close of such a period is thus made clearly evident by the Navy Department to Congress and to the country. On the other hand, a degree of financial security is offered the industries of the country by the foreknowledge which they thus obtain as to probable naval expenditures. This will encourage them to invest money in enlarging their plants for naval shipbuilding and all its allied industries. At the same time strong probability of continued work throughout the period of the program, will tend to reduce contract prices.

After careful consideration, Congress approved my recommendation, which the President had urged, and the bill of August 29, 1916, which, by comparison made all former naval bills look small indeed, provided for building 156 fighting ships, including battle cruisers (never before authorized by Congress), an increase of 23,200 men, with the additional authority, in case of "emergency," for the President to enlist 22,300 more. The previous authorized enlisted strength was 51,500 in contrast with the 97,000 men authorized by the act of August 29, 1916. The Navy Department and the Congress cooperated in this great epoch-making measure. I will say to you frankly, however, that nothing but the policy enunciated by President Wilson on the 3d of February, 1916, for "incomparably the most adequate Navy in the world" and his strong plea for the department's program, made possible the great forward step in naval progress contained in that bill.

This vision of the President established the fact that he was in advance of some naval officers vocal now, but silent then. It is true also that when war was declared the President sensed better than any naval expert across the seas the necessity for a bold and audacious

plan of naval warfare. He was the first to see the wisdom of adopting the convoy system, which he suggested even before we entered the war. Long before any naval authority abroad had approved the idea of the barrage, which was placed across the North Sea, the President sensed the futility—the utter futility—of depending solely upon pursuing the submarines all over the ocean, and declared the logical idea was to shut them up in their nests. His leadership for the bold and vigorous policy adopted by the department, communicated to the Secretary of the Navy from time to time even before the United States entered the war, and during its continuance, was set forth in a notable address made to officers of the Atlantic Fleet assembled on the quarterdeck of the *Pennsylvania*, the flagship of the fleet, at Yorktown, Va., in the summer of 1917. It was an intimate talk and an inspiring challenge to meet the extraordinary conditions by extraordinary methods, because, as the President said in that speech, “Nobody ever before fought a war like this,” and “somebody has got to think out a way not only to fight the submarine, but to do something different from what we are doing.” President Wilson counseled them—that is, I mean the naval officers present, all of them in the fleet—to “throw traditions to the wind,” pointing out the fatal defect in the defensive warfare being conducted against submarines. And I wish to call your attention to the most important utterance about naval policy before or during or since the war. Said the President:

We are hunting hornets all over the farm and letting the nest alone. None of us knows how to go to the nest and crush it, and yet I despair of hunting for hornets all over the sea when I know where the nest is, and I know that the nest is breeding hornets as fast as I can find them. I am willing for my part, and I know you are willing, for I know the stuff you are made of—I am willing to sacrifice half the navy Great Britain and we together have to crush that nest, because if we crush it the war is won.

To that company, upon whom he depended for bold action, President Wilson frankly declared:

Every time we have suggested anything to the British Admiralty the reply has come back that virtually amounted to this, that it had never been done in that way, and I felt like saying: “Well, nothing was ever done so systematically as nothing is being done now.”

Therefore, I should like to see something unusual happen, something that never was done before. There is no other way to win.

And the history of the war shows that he was a prophet.

Continuing in that speech the advocacy of the kind of daring naval warfare that made Nelson and John Paul Jones and Farragut victorious naval commanders, President Wilson went on to utter this counsel of daring and victory:

I have several times ventured to make this suggestion to the men about me in both arms of the service: “Please leave out of your vocabulary altogether the word ‘prudent.’ Do not stop to think about what is prudent for a moment. Do the thing that is audacious to the utmost point of risk and daring, because that is exactly the thing that the other side does not understand, and you will win by the audacity of method when you can not win by circumspection and prudence.”

The following is the full text of the address of President Wilson, never before made public, delivered on the quarter-deck of the

Pennsylvania to the commander in chief (Admiral Henry T. Mayo) and the officers of the Atlantic Fleet, August 11, 1917:

Admiral Mayo and gentlemen, I have not come here with malice prepense to make a speech, but I have come here to have a look at you and to say some things that perhaps may be intimately said and, even though the company is large, said in confidence. Of course, the whole circumstance of the modern time is extraordinary and I feel that just because the circumstances are extraordinary there is an opportunity to see to it that the action is extraordinary. One of the deprivations which any man in authority experiences is that he can not come into constant and intimate touch with the men with whom he is associated and necessarily associated in action.

Most of my life has been spent in contact with young men, and, though I would not admit it to them at the time, I have learned a great deal more from them than they ever learned from me. I have had most of my thinking stimulated by questions being put to me which I could not answer, and I have had a great many of my preconceived conceptions absolutely destroyed by men who had not given half the study to the subject that I myself had given. The fact of the matter is that almost every profession is pushed forward by the men who do not belong to it and know nothing about it, because they ask the ignorant questions which it would not occur to the professional man to ask at all; he supposes that they have been answered, whereas it may be that most of them had not been answered at all. The naivete of the point of view, the whole approach of the mind that has nothing to do with the question, creates an entirely different atmosphere. There is many a question asked you about the Navy which seems to you so simple-minded when you hear it that you laugh, and then you find you can not answer it. It never occurred to you that anybody could ask that question before, it is so simple.

Now, the point that is constantly in my mind, gentlemen, is this: This is an unprecedented war and, therefore, it is a war in one sense for amateurs. Nobody ever before conducted a war like this and therefore nobody can pretend to be a professional in a war like this. Here are two great navies, not to speak of the others associated with us, our own and the British, outnumbering by a very great margin the Navy to which we are opposed and yet casting about for a way in which to use our superiority and our strength, because of the novelty of the instruments used, because of the unprecedented character of the war; because, as I said just now, nobody ever before fought a war like this, in the way that this is being fought at sea, or on land either, for that matter.

The experienced soldier—experienced in previous wars—is a back number so far as his experience is concerned; not so far as his intelligence is concerned. His experience does not count, because he never fought a war as this is being fought, and therefore he is an amateur along with the rest of us. Now, somebody has got to think this war out. Somebody has got to think out the way not only to fight the submarine, but to do something different from what we are doing.

We are hunting hornets all over the farm and letting the nest alone. None of us knows how to go to the nest and crush it, and yet I despair of hunting for hornets all over the sea when I know where the nest is and know that the nest is breeding hornets as fast as I can find them. I am willing for my part, and I know you are willing, because I know the stuff you are made of—I am willing to sacrifice half the Navy Great Britain and we together have to crush that nest, because if we crush it, the war is won. I have come here to say that I do not care where it comes from, I do not care whether it comes from the youngest officer or the oldest, but I want the officers of this Navy to have the distinction of saying how this war is going to be won.

And we had it, Mr. Chairman. I wish you would put that down. He said:

I do not care whether it comes from the youngest officer or the oldest, but I want the officers of this Navy to have the distinction of saying how this war is going to be won.

That is what the President said in August, 1917; and when we completed the barrage, when we proposed the barrage—the American naval officers had the honor of saying how this war should be won so far as the naval contribution was concerned. But of course the war was won in France. [Continuing reading:]

The Secretary of the Navy and I have just been talking over plans for putting the planning machinery of the Navy at the disposal of the brains of the Navy and not stopping to ask what rank that brains has, because, as I have said before and want to repeat, so far as experience in this kind of war is concerned, we are all of the same rank.

I am not saying that I do not expect the admirals to tell us what to do, but I am saying that I want the youngest and most modest youngster in the service to tell us what we ought to do if he knows what it is. Now, I am willing to make any sacrifice for that. I mean any sacrifice of time or anything else. I am ready to put myself at the disposal of any officer in the Navy who thinks he knows how to run this war. I will not undertake to tell you whether he does or not, because I know that I do not, but I will undertake to put him in communication with those who can find out whether his idea will work or not. I have the authority to do that and I will do it with the greatest pleasure.

So that the idea that is in my mind all the time is that we are comrades in this thing. I was talking the other day with some commercial men about certain questions which seemed to affect their material interest in this war, and I said, "I can't imagine a man thinking about those things. If we don't win this war, your material interest won't make any difference. The prices you are charging are a matter of indifference with regard to the results of this war, because if we don't win it you will not have the chance to charge any prices, and I can't imagine a man in the present circumstances of the world sitting down and thinking about his own interest or the interest of anybody personally associated with him as compared with the interest of the world." I can not say it too often to any audience; we are fighting a thing, not a people. The most extraordinary circumstance of modern history is the way in which the German people have been subordinated to the German system of authority, and how they have accepted their thinking from authority as well as their action from authority. Now, we do not intend to let that method of action and of thinking be imposed upon the rest of the world. Knowing as some of us do the fine quality of the German people, we are sorry that it was ever imposed upon them and we are anxious to see that they have their glad emancipation, but we intend to see to it that no other people suffers a like limitation and subordination. We went into this war because this system touched us. These people that stopped at nothing, paid no attention to our rights, destroyed the lives of our people, invaded the dignity of our sovereignty, tried to make interest against us in the minds of our own people, and the thing was intolerable. We had to strike, but thank God we were striking not only for ourselves but for everybody else that loves liberty under God's heaven, and therefore we are in some peculiar sense the trustees of liberty.

I wish that I could think and had the brains to think in the terms of marine warfare, because I would feel then that I was figuring out the future history of the political freedom of mankind. I do not see how any man can look at the flag of the United States and fail having his mind crowded with reminiscences of the number of unselfish men, seeking no object of their own, the advantage of no dynasty, the advantage of no group of privileged people, but the advantage of his fellowmen, who have died under the folds of that beautiful emblem. I wonder if men who do die under it realize the distinction they have. There is no comparison between dying in your bed in quiet time for nothing in particular and dying under that emblem of the might and destiny and pride of a great free people. There is distinction in the privilege, and I for my part am sorry to play so peaceful a part in the business as I myself am obliged to play; and I conceive it a privilege to come and look at you men who have the other thing to do and ask you to come and tell me or tell anybody you want to tell how this thing can be better done; and we will thank God that we have got men of origina-tive brains among us.

And I may say in parenthesis that we did have the men of origina-tive brains, and in the Navy Department in Washington the greatest constructive movement of the war was originated and carried out, mainly by the American Navy [continuing reading]:

We have got to throw tradition to the wind.

No, as I have said, gentlemen, I take it for granted that nothing that I say here will be repeated, and therefore I am going to say this: Every time we have suggested anything to the British Admiralty the reply has come back that virtually amounted to this, that it had never been done that way, and I felt like saying, "Well, nothing was ever done so systematically as nothing is being done now." Therefore, I should like to see something unusual happen; something that was never done before; and inasmuch as the things that are being done to you were never done before, don't you think it is worth while to try something that was never done before against those who are doing them to you? There is no other way to win, and the whole principle of this war is the kind of thing that ought to hearten and stimulate America. America has always boasted that she could find men to do anything. She is the prize amateur nation of the world. Germany is the prize professional nation of the world. Now,

when it comes to doing new things and doing them well, I will back the amateur against the professional every time, because the professional does it out of the book and the amateur does it with his eyes open upon a new world and with a new set of circumstances. He knows so little about it that he is fool enough to try the right thing. The men that do not know the danger are the rashest men, and I have several times ventured to make this suggestion to the men about me in both arms of the service: "Please leave out of your vocabulary altogether the word 'prudent.' Do not stop to think about what is prudent for a moment. Do the things that is audacious to the utmost point of risk and daring, because that is exactly the thing that the other side does not understand, and you will win by the audacity of method when you can not win by circumspection and prudence." I think that there are willing ears to hear this in the American Navy and the American Army because that is the kind of folks we are. We get tired of the old ways and covet the new ones.

So, gentlemen, besides coming down here to give you my personal greeting and to say how absolutely I rely on you and believe in you, depend on you for brains as well as training and courage and discipline. You are doing your job admirably, the job that you have been taught to do; now let us do something that we were never taught to do and do it just as well as we are doing the older and more habitual things, and do not let anybody ever put one thought of discouragement into your minds. I do not know what is the matter with the newspapers of the United States. I suppose they have to vary the tune from time to time just to relieve their minds, but every now and then a wave of the most absurd discouragement and pessimism goes through the country and we hear nothing except of the unusual advantages and equipment and sagacity and preparation and all the other wonderful things of the German Army and Navy. My comment is always the very familiar comment, "Rats." They are working under infinite disadvantages. They not only have no more brains than we have, but they have a different and less serviceable kind of brains than we have, if we will use the brains we have got. I am not discouraged for a moment, particularly because we have not even begun and, without saying anything in disparagement of those with whom we are associated in the war, I do expect things to begin when we begin. If they do not, American history will have changed its course; the American Army and Navy will have changed their character. There will have to come a new tradition into a service which does not do new and audacious and successful things.

I am very much obliged to you for having given me this opportunity to see you and I hope you will also give me the pleasure of shaking hands with each one of you. If you ever want me again for anything in particular—because I am a busy man and can not come for anything that is not particular—send for me and I will come.

THE NORTH SEA MINE BARRAGE.

The great mine barrage across the North Sea, stretching from the Orkney Islands 230 miles to Norway, was the most effective measure that could have been adopted to curb the submarines. Rear Admiral Strauss, who commanded the American Mine Forces which laid 80 per cent of that barrage, and knows more about its effectiveness than any other officer who has testified before this committee, told you that if the northern barrage and the barrage across the Straits of Dover had been fully completed as we planned, "it would have ended the submarine menace, so far as submarines going from the North Sea into the broad Atlantic was concerned," and that the building of the mine barriers across the Adriatic and the Aegean Sea, for which we were preparing mines and material, "would have actually ended the submarine operations."

If this mine barrage, Mr. Chairman, had been laid in 1917, instead of in 1918, it would have done more than all the other measures put together to curb the submarines. Millions of tons of shipping would have been saved, and with the other barrages laid, the German U-boat warfare would have been ended. How much valuable shipping, how many lives, how many billions of dollars were lost by the delay in adopting the Navy Department's mine-barrage plans, I leave you to estimate.

Six months elapsed before we secured the British Admiralty assent to our plan for the North Sea mine barrage. The Bureau of Ordnance submitted its memorandum outlining the plan on April 15, 1917, nine days after we declared war, and a cablegram was at once sent Admiral Sims asking if it was not practicable to blockade the German coast and prevent the ingress and egress of submarines. It was, as Admiral Strauss told you, not until October 23—the proposition having been put April 3, 1917—that the Admiralty finally expressed its approval of the scheme.

SIMS OPPOSED AND DISCOURAGED THE PROJECT.

Admiral Sims had, from the beginning, declared such a project impracticable, had rejected for months every plan of the kind we proposed, and even in the allied naval conference of September 4 and 5, at which the detailed plans carried over by Admiral Mayo were presented and given favorable consideration, he was still expressing his opposition and doubt as to its effectiveness. In the account of the proceedings of that conference, at which the barrage plan was presented for discussion, Admiral Sims is quoted as saying:

It must be successful completely or it is not successful at all. Either the barrage is successful absolutely or it fails absolutely.

This was in September, 1917, five months after we had proposed the project, and in the conference at which the British were giving favorable consideration to it. In his testimony before this committee Admiral Sims has devoted thousands of words to an attempt to explain away his opposition to this barrage. But the officials of the Navy Department and the Bureau of Ordnance know, and the records show, that no one did so much to discourage and delay the plan, and no one was so active in his opposition, as was Sims himself.

SIMS TRIES TO ROB THE UNITED STATES NAVY OF ITS JUST DUES AND GIVE BRITISH CREDIT FOR BARRAGE PLAN.

Though the plan of the North Sea mine barrage originated in the Navy Department, was proposed and urged by us for half a year before we could induce the British Admiralty to approve it, though four-fifths of it was composed of American mines designed and constructed in America, transported 3,400 miles overseas, and laid by American vessels, Admiral Sims attempted to rob America and the United States Navy of the credit for initiating this great achievement and to give you the impression that it was a British plan which our Navy merely assisted in carrying out.

Admiral Sims told you that the plan for the North Sea mine barrage was drawn up and proposed by the British Admiralty, and he actually declared that the plan was "held up for discussion to see whether the American Navy Department would agree to the laying of that barrage." When you review the evidence I believe you will be convinced that his statements are utterly misleading in regard to the entire course and attitude, as well as the activities of the Navy Department and the Bureau of Ordnance.

The following is taken from the official record of Admiral Sims's testimony:

It was at this time—that is, just after the middle of August—that Admiral Mayo arrived in London.

I may say in parentheses that it was necessary for the Navy Department to send Admiral Mayo to London to take this barrage up with the Admiralty, because Admiral Sims had always opposed and doubted it. [Continuing reading:]

He brought with him a memorandum from the Bureau of Ordnance with regard to the new mine, and had been instructed by the department to discuss, at the allied conference, the possibility of offensive operations based upon the employment of this new mine.

In the agenda for the conference, prepared by Admiral Jellicoe, item 2 was that of a mine or net barrage, either in German waters or further afield. In his report of the conference, addressed to the Secretary of the Navy on September 8, Admiral Mayo said, regarding the discussion that took place:

"The British Admiralty put forward, as an alternative to a close offensive in German waters, the suggestion that the activities of enemy submarines might be restricted by the laying of an effective mine field or mine net barrage. If such an operation were undertaken it would appear that it would take the form of—

"1. An efficient mine field barrage, so as to completely shut in the North Sea, which was estimated to require about a hundred thousand mines, a number which would not be available for some considerable time; or

"2. A barrage of mine nets for the same purpose, which proposal was, in view of experience to date, deemed impracticable. The conference, after discussion, agreed that the distinct mine barrage could not well be undertaken until an adequate supply of mines of satisfactory type was assured, and that until or unless such conditions ensue, the improvements and extension of the present system of mine fields was desirable; and further, that a barrage of mine nets was impracticable."

This was Admiral Mayo's report.

The same information was cabled to the department by Admiral Mayo in cables of September 5 and September 6, 1917.

It is apparent, from the results of this conference, that once again the impracticability was clearly shown of any such scheme—

This is Admiral Sims saying this—

as that proposed by the department in its cable of May 11, which was based upon the assumption that a barrier of mine nets could be planted and maintained.

The description of the new mine, brought over by Admiral Mayo, gave an entirely new direction to the discussion, and before Admiral Mayo left he was provided with a plan, drawn up in a conference of allied officers, for a barrage of mines of this new type to be put across the North Sea.

On September 13 Admiral Mayo received a message from Admiral Benson, emphasizing the great possibilities of the new mine, stating that the British officers sent over to the United States to examine it had found it most satisfactory and urging that immediate action be taken. The result was a proposal by the Admiralty of a definite scheme for the northern mine barrage.

On October 21, after Admiral Mayo had returned to Washington and conferred with the department, the department cabled me in their No. 772 as follows:

"Sixth. Contract has been let for 100,000 mines of American type. The United States has offered to commandeer, for British Admiralty, three vessels suitable for mine laying and in addition can probably commandeer two or three more vessels suitable for mine laying, to be manned by United States, for employment in co-operation with British mine-laying force, in joint plan which may be finally agreed upon."

The CHAIRMAN. These are quotations. From whom are they quoted?

Secretary DANIELS. They are quoted from Admiral Sims's testimony before your committee.

The CHAIRMAN. From Admiral Sims's testimony?

Secretary DANIELS. Yes. I am giving his statement in full, Mr. Chairman. I want his statement fully before the committee. [Continuing reading:]

"Seventh. Question of proposed mine barrage, Scotland to Norway, as presented to Navy Department, is not definitely concurred in, but careful consideration is being given to this particular subject, with a view to arriving at a definite conclusion in

regard to employment of the mine barrage, which measure is considered in principle to promise good results."

That is to say, the mine barrage of the North Sea, the plan of which was drawn up by the British Admiralty and which had been proposed by the British Admiralty and which was taken home by Admiral Mayo, was held up for discussion to see whether the American Navy Department would agree to the laying of that barrage.

That is Admiral Sims. Now, the facts are as follows:

NAVY DEPARTMENT PROPOSED BARRAGE PLAN AND URGED IT CONTINUOUSLY UNTIL IT WAS ADOPTED.

The plan for a mine barrage across the North Sea was presented by the Bureau of Ordnance on April 15, 1917, and while this was improved as better mines were developed and was modified to meet conditions, as is the case with all such projects, this embodied the main features of the project as adopted and carried out.

That for months the Navy Department had urged the building of such a barrage, and had made one proposition after another, only to have them disapproved by the British Admiralty and declared "unfeasible" by Sims.

At last, despairing of getting any action through Sims, the Navy Department directed Admiral Mayo to present the subject to the British Admiralty, and he took with him to London the memorandum of the Bureau of Ordnance describing the new type of mine we had developed which was especially adapted to this work.

Admiral Mayo had been instructed by the Navy Department to discuss the mine barrage project at the Allied Naval Conference which met in London September 4 and 5.

"In the agenda for the conference, prepared by Admiral Jellicoe, item two was that of a mine or net barrage either in German waters or farther afield," says Sims, who also quotes from Mayo's report of the conference the statement that "the British Admiralty put forward, as an alternative to the offensive in German waters, the suggestion that the activity of enemy submarines might be restricted by the laying of an effective mine field or mine net barrage." Sims cites this in his effort to prove that the mine barrage was a British project. The truth is, as every one familiar with such matters knows, that, as the operation was in British waters and the area patrolled by British vessels, it was only proper that the proposition should be presented to the conference by the British Admiralty. As Admiral Jellicoe made out the agenda for the conference and led the discussions, it was only through him that the general plan could be placed in the formal list of subjects proposed for discussion.

"Admiral Mayo was provided," Sims says, "with a plan drawn up in conference of naval officers, for a barrage of mines of this new type to be put across the North Sea." This plan was not only based on the new mines we had developed, but upon the general proposition we had put forward in April and urged continually for five months.

Sims himself says that on September 13 Admiral Mayo "received a message from Admiral Benson emphasizing the possibilities of the new mine, stating that the British officers sent over to the United States to examine it had found it most satisfactory, and urging that immediate action be taken." "The result," Sims states, "was a proposal by the Admiralty of a definite scheme for the northern mine barrage." This shows how insistently the Navy Department was

urging this project, and it was this insistence that led to the adoption of the plan. Sims's statement that the "proposal" came from the Admiralty is ridiculous in view of the fact that we had proposed and urged it months previous.

Sims's quotation of paragraph 7 of the dispatch of October 21 to support his allegation that the project had been "held up for discussion to see whether the Navy Department would agree to the laying of the barrage" is refuted by the statement immediately preceding it that "Contract has been let for 100,000 mines of American type"—you do not hold up a thing for discussion when you order a hundred thousand mines—and that we had offered to commandeer mine-layers to carry out the joint operation. The question under discussion at that time were details as to the location, patrol, etc., where the changes proposed by the British appeared likely to reduce the efficiency of the barrage.

It was not until October 23, as Admiral Strauss pointed out, that the British Admiralty finally expressed their approval of the barrage scheme. The Navy Department had already given contracts for all the mines required, and was actively at work on the material. Changes of various kinds were suggested by the Admiralty from time to time, which caused some delay and annoyance, but the scheme was carried out successfully along the general lines proposed by the Bureau of Ordnance nine days after we declared war.

Documents and dispatches confirming the above statements will be given in detail:

PLANS PROPOSED BY THE BUREAU OF ORDNANCE ON APRIL 15, 1917.
P

The memorandum submitted by the Bureau of Ordnance, April 15, 1917, referred to two subjects—mine barrages across the North Sea and the Adriatic to prevent the ingress and egress of submarines, and protection of merchant ships by means of cellular construction and "blisters." That memorandum, which has been furnished in full to your committee, I think by Capt. Pratt, urged that we "stop the submarines at their source," and bear in mind that that was the plan of the Navy Department from April, 1917, to stop the submarines at their source; to keep the hornets from getting into the ocean; and it was suggested that mine barriers be laid across the North Sea, the Adriatic and the Dardanelles, stating:

The northern barriers would extend from the mid-eastern coast of Scotland to the Norwegian coast, a distance of about 250 miles.

The southern line (that is, to close the Straits of Dover), would extend from the southeast coast of England to the point on the French coast near the Belgian frontier, a distance of about 40 miles.

Though this plan was based on mines then in existence and proposed that they be laid much closer together than was found necessary; estimating that the entire scheme for the North Sea, the Mediterranean and the Adriatic, would involve perhaps a million mines, over ten times as many mines as were actually used in laying the northern barrage, the Bureau of Ordnance expressed the conviction that it was possible to manufacture these mines in 50 days. An immediate decision was urged. If the plan had been adopted, as we proposed and urged, in May, 1917, most, if not all of it, might have been laid in 1917. That, even if it had only been partially completed.

in 1917, it would have had a tremendous effect in curbing the submarines, is shown by the fact that it did begin the function within a month after it was started. As Admiral Strauss recounted, the first mines were placed on June 8, and "the barrier began to take toll of the enemy's submarines as early as July 9, when one was disabled on the barrier and compelled to return to Germany."

Chasing submarines over vast expanses of sea seemed so futile and illogical when they might be penned up in their home waters, we believed firmly that some such plan should be adopted. The very day after the first memorandum of the Bureau of Ordnance was submitted, April 16, 1917, I sent Admiral Sims the following dispatch:

Is it not practicable to blockade German coast efficiently and completely, thus making practically impossible the egress and ingress of submarines? The steps attempted or accomplished in this direction are to be reported at once. Yours of noon 14th April will be given earnest and immediate attention.

DANIELS,
Secretary of the Navy.

"FOUND QUITE UNFEASIBLE," SIMS REPLIED.

Admiral Sims replied to this in a cablegram dated April 18, 1917. He read you most of that dispatch as follows:

To absolutely blockade the German and Belgian coast against the entrance and departure of submarines has been found quite unfeasible. Attempts have been made with all possible means to stop egress and to prevent nets and mines being dragged out. Many nets and mine fields have been, and continue to be, laid—destroyers, submarines and other vessels have been used. Of course for craft operating so near enemy bases, the danger is great and the results have been that several have been mined and torpedoed. Even to keep up an effective patrol against submarines and raiders between Norway and Scotland has been found quite unfeasible; far too many ships were attacked. On lines between Iceland and Scotland, and between Scotland and Greenland, ice floes as well as enemy craft must be guarded against on lines where patrol is now kept up.

It is necessary to move lines after each enemy contact in order to maintain them and to prevent torpedoing, as there are no available ships to protect the cruisers from attack by submarines. The destroyer has shown itself to be, to a great degree, the most efficacious enemy of the submarines attacking commerce. All possible means are taken by the enemy to force their being assigned to other duty, even to sinking ships on hospital service. With the exception of the minimum number required by the Grand Fleet for carrying troops and their supplies, all destroyers are now so used. These vessels are being constructed as expeditiously as possible, but their number is quite insufficient to meet the existing submarine crisis, particularly as it affects merchantmen.

SIMS.

THOUGH BRITISH PLANS HAD ALL FAILED, SIMS OBJECTED TO OUR PROPOSING ANY NEW PLANS.

But Admiral Sims did not read to you the concluding paragraph of that dispatch, which was as follows:

To best of my knowledge and experience we should adopt present British methods and base further developments only upon actual experience in cooperation with them.

LLOYD-GEORGE THOUGHT IT COULD BE DONE, BUT SIMS WAS SURE IT COULDN'T.

In his letter written the next day, April 19, Admiral Sims went into further details to show how "unfeasible" was the idea of preventing the submarines from escaping from their own ports, either

by mines or any other scheme. That the British premier, Lloyd-George, had an idea that it ought to be possible, but Sims argued him out of it, as shown by the following extracts from that letter from Admiral Sims. [Reading:]

The prime minister only two days ago expressed to me the opinion that it ought to be possible to find physical means of absolutely sealing up all escape of submarines from their own ports.

I may say, Mr. Chairman, in parenthesis that it is right remarkable that Lloyd-George and the President shared the opinion of the Bureau of Ordnance and the Secretary of the Navy and the Navy Department that it was possible. But Admiral Sims goes on to say:

The fact that all such methods (nets, mines, obstructions, etc.) inherently involve the added necessity of continuous protection and maintenance by our own naval forces is seldom understood and appreciated.

And then he adds:

I finally convinced the prime minister of the fallacy of such propositions by describing the situation into which we would be led, namely, that in order to maintain our obstructions we would have to match the forces the enemy brought against them until finally the majority, if not all, of our forces would be forced into dangerous areas, where they would be subject to continual torpedo and other attack—in fact, in a position most favorable to the enemy.

Then he goes on to say in this letter to the Secretary of the Navy:

Entirely outside of the fact that the enemy does, and always can, force exits—

Always can. Bear that in mind; he “always can.” When our mine barrage was laid, he did not.

and thereby nullify the close blockade, the weather is a serious added difficulty. The heaviest anchors obtainable have been used for nets, mines, and obstructions, only to have the arduous work of weeks swept away in a few hours of heavy weather. Moorings will not hold. They chafe through. In this respect we could be of great assistance—i. e., in supply of moorings and buoys.

The channel is not now, and never has been, completely sealed against submarine egress, let alone the vaster areas of escape to the north. Submarines have gone under mine fields and have succeeded in unknown ways in evading and cutting through nets and obstructions.

I now may say from the very first beginning of our entrance into the war, the very first suggestion we made in cooperating with the British and French, was that we never could put an end to the submarine menace until we shut up the Dover Channel and put a barrage across the North Sea. That was the essential naval contribution.

BRITISH ANTISUBMARINE PLANS HAD FAILED.

The plans then in use by the British, April, 1917, as Admiral Sims had repeatedly stated, had proved an utter failure. Submarines were sinking shipping at the rate of over 800,000 tons a month. The British had not only not adopted convoy, but were pursuing the exact opposite, the dispersion of shipping, and regarded that as the best method. The only direct antisubmarine activity they were carrying on was patrolling of critical areas, and though this method had proved a failure, it was carried on for months afterward. Sims, in one of his magazine articles, in *World's Work* for September, 1919 (p. 508), says:

We figured that to make the patrol system work with complete success we should have to have one destroyer for every square mile. The area of the destroyer patrol

off Queenstown comprised about 25,000 square miles; in other words, the complete protection of the trans-Atlantic trade routes would have taken about 25,000 destroyers. And the British, as I have said, had available anywhere from 4 to 15 in this area.

That is from Sims.

Yet the one recommendation Sims urged upon us was that we "adopt British methods" and that we rush more destroyers to Europe to join in this futile chase. As he says, it would have taken 25,000 destroyers to have made an effective patrol against the submarines in this area alone, and the American Navy had 50.

When the House Naval Affairs Committee visited Europe in 1915 the chairman of that committee, upon leaving, asked Admiral Sims what Congress could do to help out. There was only one recommendation he had, "Send us 25,000 destroyers." But when the barrage was in!

NO SOLUTION IN SIGHT, JELlicoe SAID.

Did the British have any other plans that gave promise of success? Sims says they had not. In that same magazine article (p. 493), in describing his interview with Admiral Jellicoe, who disclosed the enormous amount of shipping being sunk by submarines, Sims says:

"It looks as though the Germans were winning the war," I remarked.

"They will win unless we can stop those losses, and stop them soon," the admiral replied.

"Is there no solution for the problem?" I asked.

"Absolutely none that we can see now," Jellicoe announced.

Though, Sims admits, all the methods tried by the British had failed, and there were none in sight or contemplated that gave promise of success, Sims was opposing every plan we suggested and urging that the Navy Department should merely "adopt present British methods and base further developments only upon actual experience in co-operation with them." He meant that we must abandon all our bold and efficient methods and ideas, and carry on the same ineffective methods. He not only opposed the mine barrage project then and continuously afterward until the British had finally adopted it, but objected to our proposing any new plans whatever.

ORDERED TO SUBMIT PLAN TO BRITISH ADMIRALTY.

Admiral Sims's reports that all plans of mine barrages had failed and his assertion that any such scheme was "unfeasible" did not convince the Navy Department. We knew it was a huge undertaking, but we believed it could be done. His report that all attempts to shut in the submarines by a close blockade, using mines, nets, and patrols in Heligoland Bight and along the Flanders coast had failed, focused the attention of the department upon the plan proposed by the Bureau of Ordnance for mine barrages across the North Sea and the English Channel.

The Office of Naval Operations, on May 9, 1917, outlined these plans, just a year after the war began, in a memorandum to be submitted to the British Admiralty——

The CHAIRMAN. 1917?

Secretary DANIELS. 1917.

The CHAIRMAN. That is not a year after the war began.

Secretary DANIELS. Not a year, a month after. Did I say a year? The CHAIRMAN. Yes.

Secretary DANIELS. Just a month after. I beg pardon. The office of Naval Operations on May 9, 1917, outlined these plans in a memorandum to be submitted to the British Admiralty, and I sent the following order to Admiral Sims, which he received May 11:

Consult the British Admiralty in regard to following:

Much opinion is in favor of concerted efforts by the Allies to establish a complete barrier across the North Sea, Scotland to Norway, either direct or via the Shetlands, to prevent the egress of German submarines.

This plan would involve the use of various forms of mines, nets, patrols, and the release for this purpose of all ships upon American coast patrol as well as many vessels of the Allies now employed elsewhere.

The plan also involves regulations for the commerce of Holland and Scandinavian neutrals to pass barriers and definite controlled gates.

The difficulty and size of the problem is recognized, but if it is possible of accomplishment the situation would warrant the effort.

If this plan is not feasible could not the same plan be carried out between Denmark and Norway across the Skaggerack.

Make full report.

DANIELS,
Secretary of the Navy.

“QUITE IMPRACTICABLE,” THE ADMIRALTY DECIDED.

Sims's personal opposition to any such project was so evident from his previous dispatches, that this order was made peremptory, compelling him to submit the plan to the British Admiralty and secure its formal opinion. The Admiralty replied on May 13:

From all experience Admiralty considers project of attempting to close exit to North Sea to enemy submarines by method suggested to be quite impracticable. Project has previously been considered and abandoned. The difficulty will be appreciated when total distance, depths, material, and patrols required and distance from base of operations are considered. Even if practicable to lay, maintain, and protect such a barrage, it would not, owing to want of resilience, prove effective against the passage of submarines fitted with cutters.

Special memorandum with drawings sent to Washington deals fully with limitations of barrage as result of experience.

SERIOUS ATTEMPTS AT SUCH BARRIERS ABANDONED, SIMS REPORTED.

Sims in his own dispatch regarding the subject, sent May 14, stated that—

The abandonment of any serious attempts at blockading such passages as Scotland-Norway, the Skaggerack and Scotland to Shetlands has been forced by bitter and expensive experience; all barrages, whether of mines or nets or both are not an absolute solution, for the fundamental reason that nets do not stop submarines and mine barriers can not be wholly effective unless they can be maintained by patrol at all points.

Regarding the mine-barrage project Admiral Sims, in his dispatch of May 14, said:

Replying department's cable of May 11, concerning net and other barrages for preventing the egress of enemy submarines, the general situation is as follows, based upon full conference with British Admiralty:

According to their experience all barrages, whether of mines or nets, or both, are not an absolute solution for the following fundamental reasons: Nets do not stop submarines. Mine barriers can not be wholly effective unless they could be maintained by patrol at all points. Few of the 30,000 laid in Heligoland Bight can be watched, but even if all could be patrolled it would not be wholly effective because the necessarily locally weak dispersed line of patrols can be broken by enemy concentration attacks at any point and as often as may be necessary and mines dragged out, thus

releasing submarines. A barrage that can be thus broken at will by concentrated attack is ineffective. This subject was fully explained in my letter of May 11, now on the way. For special purposes of embarrassing enemy movements unprotected barrages of mines have always been and are now extensively used in certain areas.

Bitter and extensive experience has forced the abandonment of any serious attempt at blockading such passages as Scotland to Norway, Scotland to Shetlands, Skaggerack. The one place that serious attempt at mine barrage is still attempted is the Heligland Bight. Over 30,000 mines are now planted there and mine losses there are replaced as fast as possible, about 3,000 a month. This, of course, does not and probably never can be absolutely effective for reasons above given. Enemy submarines can always find passages around and through principally close in shore and through island passages and gaps dragged in mine fields. The larger the number of mines, however, the greater degree of embarrassment to enemy. Hence the more mines we can send the better, and there is no limit to number that would be useful. Mined area much too extensive for all to be patrolled, hence no definite knowledge of number or submarines destroyed or damaged by mines.

SET FORTH MANY DIFFICULTIES AND OBJECTIONS.

Admiral Sims's letter of May 11, 1917, to which he refers in his dispatch of May 14, rehearsed numerous difficulties and objections to any kind of mine barrier, most of which did not apply to the plan that we proposed, as will be seen from the text of that portion of his letter:

15. Numerous propositions are made to the British Admiralty that have for their object the closing of the North Sea of the German ports against the ingress or egress of submarines. These are presented by all classes of people, including members of Parliament.

They are, generally speaking, of two classes, namely, mines or nets, or both. I have gone over this whole matter with the First Sea Lord and those members of the Admiralty Board who are specially charged with the practical details of such matters.

16. As may well be imagined, this whole subject has been given the most earnest consideration, as it is of course realized that if submarines could be kept from coming out the whole problem would at once be solved.

17. As a result of this consideration many schemes have been tried. The following is a brief summary of those tried and the difficulty encountered.

18. It has been found that no net will stop a submarine if it is securely anchored at each end. The submarines are fitted with net cutters on the bow and sides, housing periscopes, and strong steel guys from the bow to the tower.

19. But even those not so fitted can steam through a net unless one end is held by a trawler with winch for slacking off the anchor line.

20. Nets have been fitted, with numerous small mines which will blow a hole through a submarine's sides, but as soon as the nature and location of such nets were known, the submarines made a practice of approaching with the periscope out until the surface buoys were sighted, then rising to the surface, running over the buoys, and immediately diving again. An attempt is being made to so fit the buoys that contact with them will explode the mines immediately below.

21. There has been great difficulty in maintaining nets and mines in place. Gales frequently sweep out both, and the enemy mine sweepers are constantly at work destroying them.

22. In some places neither mines nor nets are effective on account of the strong tides. This is particularly the case between the Orkney and Shetland Islands.

23. Mines and nets are very extensively used in the attempt to prevent the ingress and egress of submarines from German ports and to embarrass their movements, and also in attempting to prevent their passage through the channel. I have been shown the working charts and have had the various efforts explained to me by Admiral Jellicoe.

24. Generally speaking, the area inclosed, within a line running first NNW., then north, from Texal Island, thence in a curve to the eastward to a point north of Born Reef, contains numerous lines and fields of mines. Within this area there are at least 30,000 mines, and additional ones are being laid at the rate of 3,000 a month. The field is now being extended to the westward and northward from Texal Island to Broken Bank. (See chart of the British Islands and North Sea.) Some submarines are known to have been destroyed by these mines, but they do not know. Some have

also been destroyed in the channel; but the difficulty of the problem will be recognized from the fact that the comparatively narrow Dover Strait is not now completely closed to the passage of submarines.

25. This latter illustrates the difficulty of closing such a wide gap as the northern entrance to the North Sea from Kinnard Head to Norway. On this line of about 230 miles there is from 30 to over 100 fathoms of water. The number of patrol boats necessary to watch these nets would be very great.

26. As for protecting such a long line, or any line of considerable length, it is, of course, physically impossible to do so effectively, and this for the fundamental reason that the defense is stretched out in a long and locally weak line, while the enemy can concentrate an attack at any point of it, destroy the patrol vessels and drag out some section of the mines or net, thus permitting the passage of any number of submarines.

27. This can be done in as many places as desired and as often as may be necessary, whether the barrier is nets or mines; and it is because of this fundamental principle of a concentrated attack against a point of a necessarily dispersed force that no such barrier can ever be sufficiently effective to prevent the passage of all the submarines the enemy wished to send out.

28. This is the gist of the whole matter—the physical impossibility of a dispersed force successfully resisting a locally concentrated attack:

(a) Enemy cruiser of considerable gun power can make a hole in a patrol of a barrier.

(b) The patrol vessels must retire before such a force, thus permitting a section of mines or nets to be dragged out, and thus defeating the object of the barrier.

(c) It has, of course, been proposed to guard a barrier with heavy vessels. This is what Germany hopes Great Britain will do, thus exposing them to torpedo attack and permitting their policy of attrition to be carried out. The British vessels would also be exposed to similar attack, but the British can not successfully compete with Germany in torpedo warfare, particularly near the bases of the latter.

(d) I can not too strongly emphasize the fact that during nearly three years of actual warfare this whole question has been the most serious subject of consideration by the British Admiralty, and that many schemes of the nature of those in question have been thoroughly discussed, and those considered practicable—those which do not violate a fundamental principle—have been, or are now being, tried and extended; but the point is that no barrier can be completely effective and, unfortunately, a barrier or system of barriers, such as mines, etc., needs only to be slightly ineffective to permit continuous passage without much loss of submarines.

29. It is in view of the above and of the large amount of supporting evidence obtained that I have so urgently recommended that our primary military effort should be concentrated in getting the maximum number of antisubmarine craft of all descriptions into the enemy's mine area of activity.

Nets, barriers, and similar methods can never be entirely effective but only palliative. The submarine must always be opposed in its fields of action, and the most effective opposition discovered to date in number of antisubmarine craft. The difficulty at the present time is lack of such craft.

SUGGESTED THAT WE ABANDON MINING ACTIVITIES AND "CONCENTRATE ON OTHER WORK."

Though we had a very competent staff of experts, which developed mines and depth charges far superior to any then in existence, Admiral Sims did his best to discourage our mining activities. Despite the fact that, as he stated in his dispatch of April 16, he had sent us the drawings of the latest type of mine adopted by the Admiralty, and that our Bureau of Ordnance was developing a new and better type, Admiral Sims on May 31 sent a cablegram—I wish you would listen to this, gentlemen—which suggested that we give up the idea of providing mines in large quantities, and that it would be "more profitable" to "concentrate on other work." This dispatch was as follows:

With reference to my previous dispatches concerning our supplying mines, the British Admiralty have concentrated on mine construction to such an extent that they now expect the output by August will reach 10,000 a month. Their maximum facilities for laying mines are about 7,000 a month. From their previous experience with mines, similar to those which we now have on hand, they consider it unwise to attempt to utilize our present available supply. In view of above, and as our

output of a different type of mine would not be available in sufficient time, they now consider we can more profitably concentrate on other work.

In other words, he advised us to quit work on the only great new thing of the war in the Navy, and do something else.

We had no idea of abandoning our mine-production activities, which we knew were, and later proved to be, of the highest importance, excelling both in designs and quantity the production of any other country.

We knew no European government had succeeded in producing anything like all the mines it could use, and that many thousands more were needed, and Sims was informed on June 23 that we would soon be in a position to manufacture either the British mine or a superior type at the rate of 4,000 a week. The dispatch I sent him follows:

The Bureau of Ordnance is now in a position to manufacture latest type of Admiralty mine, or a superior type, at the rate of 4,000 per week, beginning 60 days from now. Is it the opinion of the Admiralty that possible future improvements make it desirable that we construct a surplus supply for possible use in European waters; if so, how many do they suggest we ought to manufacture? Would the Admiralty like to have us manufacture nets for use over there? If so, send details at once. Has a mine, not effective against surface craft, but effect against submarines, ever been under consideration? Are there any plans of future contemplated operations that we could be supplied with?

CONCLUDED THEN THAT MINES WE COULD FURNISH WOULD BE
"INVALUABLE."

Since sending his dispatch of May 31, suggesting that we "concentrate on other work," Sims seems to have a change of mind. He suddenly discovered that our Bureau of Ordnance could render "invaluable" assistance to the British in producing mines and depth charges. After waiting two weeks he sent the following reply to my dispatch, which he had received June 23:

Sent: July 7, 1917.

To: Secretary of the Navy.

Through: Admiralty.

Via: Naval attaché, Washington.

Number 84. Replying your number 31, all assistance which Bureau of Ordnance can render in manufacture of efficient type of mines and depth charges will be invaluable. British output at present in excess of available ships to handle, but numbers ships being increased. Can we furnish mine layers as well as mines? Admiralty experience now indicates necessity for abandoning entirely the Elia lever type in favor of the German horn type, with horns on bottom as well as on top. Also necessity for increased buoyancy to oppose tides. Latest type will have 500-pound buoyancy, and 1,300-pound anchorage. For mining against submarines, they are now using fixed instead of automatic depth anchorage, as one floating mine or mine near surface discloses an entire field. Many designs of mines effective against submarines, but ineffective against surface craft, have been considered, but no satisfactory type developed to date. Admiralty would appreciate information if such a mine has been developed. Drawings of latest British mine of horn type forwarded 28th June. Nets, moorings, and wire gear generally are available, to the extent to which they can be used, and it is urgently necessary to reduce demands on shipping. Brazil is asking England for nets. Can we meet her demands? Delay in answering this cable due to impossibility of keeping up the the work here with present staff.

Admiral Sims followed this up a week later in his letter of July 14, with the following regarding the mine situation:

Mines: There seems to have been a misunderstanding, probably owing to the inadequacy of cable communication, concerning our cooperation as regards mines. The responsibility concerning such a misunderstanding, if it has occurred, should be mine, as it was probably due to lack of time on my part to follow all of the subjects which affect the cause, and to clearly set them before the department.

There is, of course, an urgent need of mines and, as I originally stated in a cable, too many could hardly be available.

Up to the present, however, the British output of mines has been equal to, or in excess of, their facilities for laying them.

An attempt is now being made to impress certain auxiliary vessels into service for this duty.

Great difficulty has also been experienced, due to the stress of other important war requirements, to obtain a mine of satisfactory design to meet the unusual conditions which have developed.

Serious troubles developed from the beginning with the Vickers Elia type, and as all British mine manufacturing facilities were equipped to build the Elia mine, it was very difficult to alter the design, as experience from time to time indicated to be necessary and to change the methods of manufacture which were thereby imposed.

It has now been decided to abandon this type of mine entirely, in favor of a mine of the type used by the enemy, modified in accordance with British experience.

In fact, the drawings of this type of mine, which are now in the department, do not cover the latest developments which have occurred since they were prepared.

The mine question is a very serious one and our cooperation can only be efficiently directed by having an expert representative of the Bureau of Ordnance here at all times.

At the present moment the enemy is making determined efforts to sweep numerous channels through the mine fields in Heligoland Bight. The extent of the mine fields renders offensive operations against the enemy mine sweepers very difficult, particularly as they are aided by Zeppelin scouts.

In addition, mining activities are going on in other areas, particularly the Belgian coast at the western end of the allied lines.

Recent evidence has indicated preparations on the part of the enemy to attempt a landing to the south of the allied lines, apparently with a view to outflanking, and as a result new mine fields are being laid by the British in that area.

KEPT WORKING ON PLANS FOR BARRAGE.

The British Admiralty, whose approval was necessary, had rejected the proposition, Sims had urged scores of objections to it; but the department did not abandon the idea, and the Bureau of Ordnance continued its work in developing some plan that might prove acceptable to the Admiralty.

Though the North Sea mine barrage could have been constructed, as Admiral Strauss told you, with the types of mines in existence when the plan was proposed and Sims and the British had never based their opposition on the ground that an entirely new type was necessary, our ordnance officers were working from April on to develop a new type especially adapted for the purpose.

I may say here that in his testimony Admiral Strauss stated that the British, who laid about one-fifth of the mines, did not use the new mines at all, but used the horn mine, showing that it could have been laid with the type of mine we had in April.

The CHAIRMAN. But it would have taken more mines?

Secretary DANIELS. Yes; it would have taken more mines. We could have provided them.

On July 18, the Bureau of Ordnance, in a letter to the Chief of Operations, announced the development of a new type of mine firing gear, especially suitable for mines for a North Sea barrage.

BARRAGE PLANS AGAIN SUBMITTED.

On July 30 the bureau addressed another communication to the Chief of Naval Operations, giving more complete information regarding the new mine and renewing the proposal of an American-British joint offensive in the form of a northern barrage. This was entitled "Proposed British-American joint offensive operations; submarine barriers; Mark VI mines." That document, which will be presented in full elsewhere, was notably comprehensive and

contained all the essential features of the mine-barrage plan as it was eventually adopted and carried into effect.

MAYO, GIVEN FULL INFORMATION, PRESENTED PLAN TO THE ADMIRALTY.

The determined opposition of Sims and his hostility toward the project compelled us to take other means to present it fairly to the British authorities, and Admiral Mayo was given full information and was directed to present the matter to the British Admiralty and the Allied Naval Conference, which he was to attend in London, and to urge its adoption. We were perfectly willing to accept any modification of the plan which the British might propose and which would not too greatly impair the efficiency of the barrage. We were not disposed to haggle over details or to insist upon our views in all particulars. Our sole object was to get a mine barrage laid across the North Sea, and we were sure we could do it and make it a success; and history shows that we were right in April, 1916.

The CHAIRMAN. Do you mean that we stretched a mine barrage across the North Sea?

Secretary DANIELS. That we did?

The CHAIRMAN. Yes.

Secretary DANIELS. Admiral Strauss's testimony is adequate to that point.

The CHAIRMAN. I do not think it says we did.

Secretary DANIELS. Just before his departure Admiral Mayo conferred with Rear Admiral Ralph Earle, Chief of the Bureau of Ordnance, and officers of the mine section regarding the new mine and its value for the proposed barrage, and he was furnished with a memorandum that gave, in complete detail, plans for the northern mine barrage which were essentially the same as were finally adopted.

ASKED THAT BRITISH OFFICER BE SENT TO TEST NEW MINE.

Sims, in his dispatch, of May 31, advising us that we could "more profitably concentrate on other work" than mine manufacture, stated as one of the reasons that "our output of a different type of mine would not be available in sufficient time." If we had adopted his idea, the new type would never have been developed. But it was developed, and various tests indicated that, for deep-sea mining, it was far in advance of anything before produced. To pave the way for Admiral Mayo's renewal of the proposition for the barrage and our further effort to convince the Admiralty that the project was entirely feasible, on August 17 a cablegram was sent to Admiral Sims regarding the new mine developed by the Bureau of Ordnance, and requesting that the Admiralty send an officer to America to inspect and thoroughly test it, so that they would be assured of its efficiency. Following is that dispatch:

AUGUST 17, 1917.

Vice Admiral Sims:

Opnav. 187. Bureauord has developed a mine which it hopes may have decisive influence upon operations against submarines. Utmost secrecy considered necessary. Request that an officer representing the Admiralty clothed with powers to decide be sent here to inspect and thoroughly test mine and, if found satisfactory, arrange for cooperation in mining operations. 20017.

SECNAV.

(At 11.55 a. m. the subcommittee adjourned until to-morrow, Wednesday, May 12, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

WEDNESDAY, MAY 12, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Secretary Daniels, will you proceed?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

SECRETARY DANIELS. Mr. Chairman, when the committee adjourned yesterday, I was in the midst of the statement about the North Sea barrage, the great outstanding work of construction of the Navy in the World War.

The northern mine barrage project was taken up at the allied naval conference in London September 4-5, 1917, which was attended by Admiral Mayo. The British Admiralty history in reference to the proceedings states that "Admiral Jellicoe put forward the suggestion of laying an efficient barrage so as to completely shut in the North Sea." But it also shows that he did not think it would have much more result than the existing British policy unless a better mine could be used and produced in sufficient numbers. In that event the matter would be different.

That Sims was still opposing the project and casting doubt upon its practicability is shown by the account of the proceedings, which quotes Admiral Sims as saying:

It must be successful completely or it is not successful at all. Either the barrage is successful absolutely or it fails absolutely.

Sir Eric Geddes, first lord of the admiralty, said;

I do not understand from the remarks of the first sea lord (Admiral Jellicoe) that the barrage should take the place of other offensive measures. It is not considered that the barrage can be sufficiently relied upon to take the place entirely of other measures for hunting and destroying submarines.

This indicated that Sir Eric Geddes looked upon the plan with some favor, and was not inclined to accept Sims's view.

STILL IN DOUBT AFTER NAVAL CONFERENCE.

Admiral Mayo, in his report of the conference, cabling to the Chief of Naval Operations September 6, said:

Conference completed after agreement upon the following points:

1. That close offensive in German waters should be carefully considered by Allies, after which they should indicate to British Admiralty contribution of old warships they are prepared to furnish should offensive prove practicable.

2. That alternative offensive employing effective mine field or mine net barrage to completely shut in North Sea not practicable until adequate supply satisfactory type mines assured and that pending such supply extension present system mine fields desirable and that mine net barrage impracticable.

As this indicated that the British still considered the barrage impracticable unless an adequate supply of mines of a satisfactory type was assured, and that they were still doubtful of the efficacy of the mine we had designed and perhaps of our ability to produce the large numbers required, it was evident that further urging was needed to secure the approval of the project.

Admiral Benson, therefore, on September 12, sent the following dispatch to Admiral Mayo:

From: Chief of Naval Operations.

To: Commander in Chief Atlantic Fleet.

OPNAV. 407. There are great possibilities in the satisfactory solution of the mine and depth charge question. Officers sent over here most satisfactory and remarkably well posted. I think it would help the whole situation wonderfully if Commodore Gaunt could visit the Admiralty for a few days and have a heart to heart talk. No time to be lost.

BENSON.

He said that no time was to be lost. So that there you see Benson is telegraphing in the usual method of the Navy Department, boldness and audacity, and no time to be lost; and yet we had lost five months then.

Admiral Sims states, in his testimony:

On September 13 Admiral Mayo received a message from Admiral Benson emphasizing the great possibilities of the new mine, stating that the British officers sent over to the United States to examine it had found it most satisfactory, and urging that immediate action be taken. The result was a proposal by the Admiralty—

Now listen to this, gentlemen:

The result was a proposal by the Admiralty of a definite scheme for the northern mine barrage.

On April 13 the Navy Department had proposed the mine barrage, and on September 13 Sims says the Admiralty proposed it.

On September 14, the day after Admiral Benson's dispatch was received, the Admiralty plans division made out for Admiral Mayo a paper entitled "General future policy, including mine policy," with an appendix, "Mine barrage across the North Sea," which contained the following concerning the barrage project:

The enemy submarine campaign now dominates and overshadows every other consideration, and any increase in the present rate of sinking might bring about an unsatisfactory peace.

It therefore appears that our future policy must be directed toward a more concentrated and effective control in the areas between the enemy's ports and our trade routes.

Some form of barrage corresponding to that which was formerly established by the Battle Fleet * * * must be reconstituted in such a form that the enemy submarine can not venture into it without considerable risk to themselves.

The very thing we proposed in April, 1917, and in September they begin to see the light.

Details for the requirements for a barrage across the North Sea were set forth in an appendix. The Admiralty "History of northern barrage" states that—

as a result of this paper, it was decided to proceed with preparations for laying a barrage on the Aberdeen-Norway line.

Both Sims's testimony and the Admiralty aistory show that it was only after we urged and insisted that immediate action be taken and gave them the utmost assurance that the new American mine was satisfactory and adapted to the purpose that the British were induced to take any definite action.

While Sims calls that memorumdam "a proposal" and by this tries to convince you that the mine barrage was proposed by the British and while the appendix went into considerable detail concerning the requirements for such a barrage, this paper was really only a tentative acceptance of the general plan we had been urging since April.

BENSON TRIES TO CLEAR UP DOUBT.

The Admiralty had not even then definitely approved the barrage plan, and their dispatches regarding mines left us in such doubt that on September 15, Admiral Benson sent the following dispatch to Admiral Sims:

Vice Admiral Sims:

Opnav 438, department advised by Commodore Gaunt "Admiralty instructs me to inform you that the United States offer of the mines is gratefully accepted."

Inform the department if the above refers to Admiralty approval of combining joint operations as indicated by Mayo or merely furnishing a large number of mines by this Government? If the latter, approximately how many are required?

OPNAV.

STILL "INVESTIGATING" IN OCTOBER.

That in October the Admiralty was still considering the matter and had not yet made a definite decision will be seen from this letter from Admiral Sims to the Secretary of the Navy (general report) October 9, 1917. We urged it on April 13, and this was October 9' Reading:]

14. Mining:

It is understood that the general questions of future plans as regards mining particularly in the North Sea will be taken up with the Commander in Chief, Admiral Mayo, upon his return.

The Admiralty is thoroughly investigating this question with a view to expediting such detailed plans as may later be drawn up in cooperation with the Navy Department.

It is understood from discussions with officials in the Admiralty that the general plan proposed will involve very extensive shore work such as established ofmfts depots for assembly, tests, and so forth. Also that this will probably require sending over from the United States comparatively large personnel force for these shore stations.

The detailed discussions of these questions will probably be postponed by the Admiralty until the return of the commander in chief.

Now listen, gentlemen, here is what Admiral Sims recommends. We have been compelled to send Admiral Mayo over to present the department's views, and to get consideration; and yet now, after Admiral Sims for six months had said that it was impracticable and unfeasible, he then wishes us to communicate only through him, when we had to go over him to get action. [Continuing reading:]

It is recommended that the force commander—

That is himself—

be used as the channel of communication with the Admiralty in all matters concerning this subject, as such a course will be conducive to avoiding misunderstandings and misinterpretations. If some communications or cablegrams pass direct to and from the Admiralty through its representative in Washington to the department, and

others through this office, the chance of confusion and misunderstanding will be considerable, as it has been apparently in the past.

The Navy Department went ahead with its preparations, being convinced that the barrage plan must be eventually approved, and that any disagreements or modifications could surely be adjusted by the two Navies. Upon the return of Admiral Mayo to the United States a conference was held on the subject in the office of the Chief of Naval Operations on October 15, and the project, as amended by the British, was considered and approved by the General Board.

NOTIFIED OF ADMIRALTY'S APPROVAL OCTOBER 23, 1917.

On October 17 the Chief of Naval Operations received a dispatch from the British Chief of Naval Staff, asking when supply of mines and sinkers would begin. This apparently indicated that the Admiralty had approved the project, yet we had not been so notified. On October 20 Admiral Benson cabled to Admiral Sims:

OCTOBER 20, 1917.

VICE ADMIRAL SIMS:

Opnav. 780. The department requests to be informed whether the plan for the placing of a mine barrier across the North Sea on the Aberdeen-Egersund line has the approval of the Admiralty. It is believed that the great experience of the British naval forces in North Sea operations and their experience in naval mining during the present war puts them in the best position to decide whether the proposed scheme is practicable in construction and maintenance and whether, in the opinion of the Admiralty, it is the best scheme in sight for limiting the operations of enemy submarines provided that the Straits of Dover can be efficiently closed to the passage of submarines which, if possible, in the opinion of the department should be done at the earliest possible date.

OPNAV.

The following reply was received by the department October 23:

OCTOBER 22, 1917.

From: Admiralty C. N. S.

To: Commodore Gaunt, Washington, for Chief of Naval Operations.

Your 780 to Admiral Sims. Admiralty has approved mine barrier and now confirms approval.

This is the 22d of October, six months and eight days after we approved it—time that was of the essence lost. [Continuing reading:]

Preparations proceeding rapidly. Assistance desired from U. S. A. as indicated in my telegram No. 513 of 17th October. Admiralty consider this is best scheme to be carried out at a distance from enemy bases. Admiralty is working on supplementary scheme for operations closer inshore, but any such inshore has defect that enemy can eventually clear a passage through for submarines.

Mr. Chairman, I want to call attention to that paragraph, because I shall later show you that the British never did close the inshore places in the barrage, as we desired, and that that was the only error of the scheme as carried out. [Continuing reading:]

Therefore North Sea barrage also necessary. No scheme yet tried has effectively closed Dover Straits to submarines—

This was six months after we urged it—

but measures are being constantly deterrent. Extensive mining operations in Dover Straits against submarines commence in November. Hitherto delayed from lack of effective antisubmarine mine.

CONTRACT HAD BEEN LET FOR 100,000 MINES.

The cablegram of October 20, which Admiral Sims read to you in part, was a reply to numerous specific requests made by Great Britain in a memorandum given Admiral Mayo while he was in England. The portion relative to the mine-barrage is as follows:

6. Contract has been let for 100,000 mines of American type. The United States has offered to commandeer for the British Admiralty three vessels suitable for mine-laying, and in addition can probably commandeer two or three more vessels suitable for mine-laying to be manned by the United States for employment in cooperation with British mine-laying forces in any joint plan which may finally be agreed upon.

7. Question of the proposed mine-barrage from Scotland to Norway as presented to the Navy Department is not definitely concurred in, but careful consideration is being given to this particular subject with a view of arriving at definite conclusions in regard to the employment of the mine-barrage, which measure is considered in principle to promise good results.

The following matters were not included in the memorandum referred to, but were specifically in connection therewith.

8. It is considered the American type mine is perfectly safe and inoperative upon breaking away from its moorings.

9. The standard British Admiralty type of sinker can be used with the American type mine.

As this and the preceding dispatch of the same date show, the Navy Department had not been notified that the Admiralty had approved the project and was giving careful consideration to certain modifications in the plan which had been suggested by the British and which we feared might seriously impair the efficiency of the barrage. We were expediting the preparation of material and had already let the contract for the entire 100,000 mines that would be required.

AMENDED PLAN FINALLY ACCEPTED.

The dispatch from Sims, indicating that the British Admiralty had made a definite decision, was received in the department on October 23. Though we did not consider that the amended plan was as good as our own, as the British proposal lessened its efficiency, we were so glad to get, finally—and I use the word “finally”; it had been from April 16 to October 23, six months of precious time wasted—a decision from the Admiralty that, in order to avoid delay we interposed no objections. Within a week we had worked out all the details involved in the amended plan, and on October 29 I approved the project as outlined. It was favorably acted upon by the President, who had from the first earnestly desired its adoption, at a Cabinet meeting on October 30, and the Chief of Naval Operations cabled to the Admiralty:

Department concurs in project for mine barriers Scotland to Norway and has already taken steps to fit out eight such mine-planters to sail February 1. Expect to begin shipment of mines January 15. Will send officers to confer and arrange details in a few days.

SIX MONTHS DELAY IN GETTING PROJECT APPROVED.

As will be seen, gentlemen, it was six months after we had proposed the laying of this barrage before it was definitely and finally approved by the Admiralty. There is every reason to believe that if Admiral Sims had favorably presented the proposition to the British authorities, and had urged the view of the Navy Department

instead of airing his own personal opposition, it would have been accepted by the Admiralty months earlier. But Sims, as his dispatches and letters show, not only did not urge any plan of shutting in the enemy submarines but continually opposed it, not only using every effort to convince the Navy Department that it was impracticable and "unfeasible", but argued against it in conferences with British officials who were inclined to give it favorable consideration. In his letter of April 19, 1917, he states that the Prime Minister believed that some such scheme was possible, and Sims describes how he argued with Lloyd-George to convince him that any such plan was entirely impracticable. The evidence shows that no small part of the delay in the adoption of the barrage scheme was due to Sims.

NEVER BASED HIS OPPOSITION ON TYPE OF MINE.

In all the various and strongly expressed reasons he gave in all his dispatches, communications, and arguments from the time the barrage was proposed in April, 1917—now, I wish to emphasize this—Admiral Sims never once based his opposition on the type of mines. He declared that all plans for closing the North Sea were impracticable, and that the British had tried out various types of mine barriers and none had proved successful. Yet in his testimony Admiral Sims declared:

The thing which made possible the northern barrage was the use of a certain type of mine known as the antennæ mine, because of its technical features, which had not been invented at the time this dispatch was sent to the department.

He was referring to his dispatch of May 14, in which he said that no barrages, either of mines or nets, were effective, and that—

bitter and expensive experience had forced the abandonment of any serious attempts at blockading such passage as Scotland to Norway.

That was the very thing we did, and did successfully.

Admiral Sims also told you that —

with the invention in the United States of a new type of mine, the project was put in an entirely new light and it merited further consideration.

Is it not clear from his dispatches and letters that all this talk about a new type is an afterthought with him? Without any reference to any particular type, he opposed the whole project for months. Our mine was superior, but an effective barrage could have been laid in the early part of 1917, as we proposed, of the type of mine then in use.

The British, who laid 20 per cent of the barrage, used this old type of mine. They never did use the antennæ mine, which was superior. But their mine was a good mine, although not as good as ours.

Admiral Strauss told you that the laying of the barrage was not only not entirely dependent upon the antennæ mine, but that none of the mines laid by the British in their part of the barrage were of this type. The following is quoted from his testimony:

The CHAIRMAN. Would it have been feasible to lay any barrage without the antennæ mines that were last discovered?

Admiral STRAUSS. Oh, yes; perfectly feasible. The British shared in this barrage, and they had no antennæ mines. Their mines are not antennæ mines.

The CHAIRMAN. Would it have been feasible for us to have sent over a sufficient number of the other, the old fashioned, mines, which as you have already stated required at least three to one of the antennæ mines, to have constructed this barrage?

Admiral STRAUSS. For a barrage equal to the one we laid, it would have taken about 180,000 mines.

The CHAIRMAN. About 180,000 mines?

Admiral STRAUSS. And we actually sent over 80,000.

The CHAIRMAN. And a considerable number of ships to take them over, would it not?

Admiral STRAUSS. Well, we kept a certain number busy going back and forth. We got 64 cargoes in all, but most of them were repeats—the same ship. We ran a sort of line of mines from the United States to the coast of Scotland.

The CHAIRMAN. And you think it would have been feasible to have gone ahead with the other barrage?

Admiral STRAUSS. Yes.

ORDNANCE READY TO BEGIN WORK EARLY IN 1917.

The Bureau of Ordnance was ready to proceed with the undertaking in April, 1917, using types of mines then existing, making improvements in design to suit conditions. Now, listen to this, gentlemen, to show the degree of confidence that the Bureau of Ordnance had and the ability that they showed. There never was a department in the world that functioned better than had the bureau organization of the Bureau of Ordnance, from the beginning of the war. The bureau proposed to begin manufacture on a huge scale, and estimated that, even if a million mines were required by utilizing the capacity of a considerable number of large factories they could be produced in 50 days. Urging the necessity of a prompt definition of policy, the bureau set forth the magnitude of the undertaking and said:

If an immediate decision—April 1917—should be made the proposed barrier could not be put into effect inside of six months.

Showing the necessity of immediate action, because it took time.

Though the plan as finally adopted necessitated the manufacture of 100,000 mines of an entirely new type, requiring special designs and apparatus, the bureau's work in manufacturing and assembling the material was practically completed in six months.

It was six months from the time the Navy Department proposed the scheme before it was accepted by the British Admiralty. But this is not by any means all the delay that was caused by the Admiralty's hesitation and Sims's opposition. Mine laying in the stormy North Sea is very difficult, almost impracticable, in winter weather. The whole summer and autumn of 1917 was lost to us, and mine laying on a large scale did not begin until the late spring of 1918.

BARRAGE COULD HAVE BEEN LAID IN HALF THE TIME, ADMIRAL STRAUSS SAYS.

It was not until June 8, 1918, that the American vessels began laying mines. They planted 3,385 mines on that first trip.

I would like you, gentlemen, to listen to this very carefully. This is the very meat of it.

Admiral Strauss told you that if he had had American destroyers under his command to escort the mine layers, and had been permitted to issue his own routing orders, the barrage could have been laid in half the time. He told you that it took three weeks to get the Admiralty to rescind Admiral Beatty's order not to place any mines west of the meridian of Greenwich, which would have left a gap in the barrage of 70 miles. He told you of the long delays caused by the

mine force waiting for British escort vessels and routing orders. The following is quoted from his testimony:

The CHAIRMAN. And you think it would have been better to have kept the American mining force as a completely separate force under a separate command?

Admiral STRAUSS. I think it would have been better. I would have preferred to have operated with my own force of destroyers as a screen, and the battleship squadron that we had out there as a protection, because we lost half of our time in waiting for orders from Admiral Beatty. We expended just one-half of the time we were in the North Sea waiting for this unity of command.

The CHAIRMAN. What would have been the effect so far as protection of the mine force by the Grand Fleet was concerned?

Admiral STRAUSS. It would have been all right if we had had a fleet of destroyers and what we called the Sixth Battleship Squadron, Admiral Rodman's battle squadron, to protect us in our operations. We could have done the work in half the time.

That is the statement of the admiral who carried out this great constructive work, by all odds the greatest naval operation of the war except carrying the troops to France, which, of course, was the overshadowing and great contribution.

MINE BARRAGE WAS NOT A "DELUSIVE FALLACY."

In concluding his long statement regarding the mine barrage, Admiral Sims says:

The idea of making a grand stroke which would at one fell swoop reduce the enemy to confusion and force him to surrender, has been throughout history one of those fascinating and delusive fallacies which have cost many a defeat.

But the mine barrage was not a "delusive fallacy." The fallacy was on the part of Sims, who denounced the project as impracticable, vigorously opposed it, and had no small part in preventing its adoption for months. Admiral Sims cited the proposals we made for the barrage as an example of the Navy Department's insistence "upon a number of plans that could not be carried out," which is one of the charges he made in his letter of January 7. But this plan was carried out in 1918, and would have been put into effect in 1917 had not Sims and the Admiralty so strongly opposed its adoption. And it was not merely a "useful supplementary measure," but was the most effective antisubmarine measure that could possibly have been adopted.

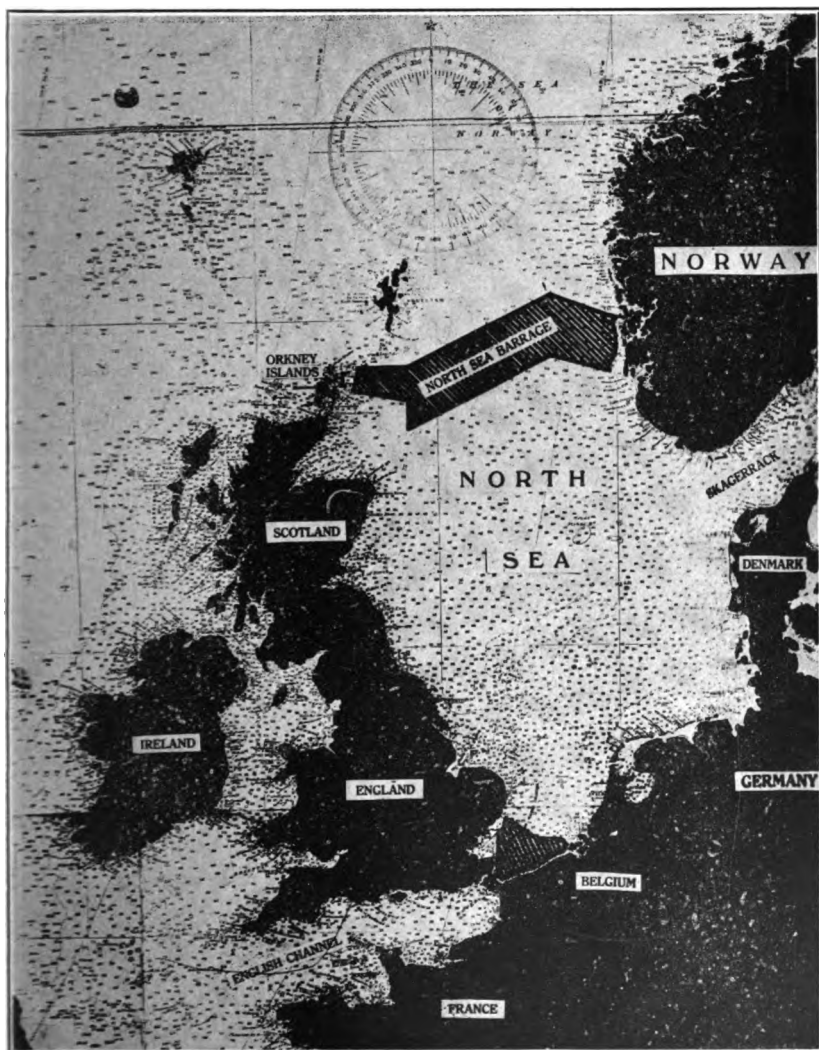

Sims himself says, after its completion and success, that "No such project has ever been carried out more successfully," and that "as an achievement it stands as one of the wonders of the war."

The North Sea mine barrage was proposed by the Navy Department six months before it was approved by the British Admiralty. Eighty per cent of it was American mines laid by United States naval vessels; we manufactured 100,000 mines, transported 80,000 over 3,400 miles; and planted 56,611 of the 70,000 mines laid. In view of the facts, Sims' attempt to deprive the United States Navy of full credit for this project is as futile as are his attempts to explain away his own opposition to the barrage.

Mr. CHAIRMAN. I wish to put in the record a map of the mine barrage, showing how it was laid, and to put under the map an explanation of it.

The CHAIRMAN. Very well.

Secretary DANIELS. And I also wish to put in another map that is another illustration. This map shows that a mine barrage was laid within 10 miles of the Orkney Islands, and entirely to the island

174273-20. (To follow page 2047.) No. 1.

174273- 20. (To follow page 2047.) No. 2.

of Utsire, on the Norway coast, and the people of Norway mined all around that island; so that on the Norway side a submarine could not get through. On the Orkney Islands side the plan of the British was to patrol that base, that 10 miles, in order to keep any submarine from passing. I shall add some explanations to this map, with your permission.

(The maps above referred to are printed herewith.)

Secretary DANIELS. I said just now, Mr. Chairman, that in all the history of preparation for war in any country in the world nothing exceeded the work of the Bureau of Ordnance of the Navy Department from March 5, 1913, to this very minute. That department was under the control in 1913 of Admiral Twining. He was succeeded by Admiral Strauss and he was succeeded by Admiral Earle. I shall only present what the Bureau of Ordnance did in preparation for war and in actual work for war from the time Admiral Earle came into office, which was December 23, 1916. I will not read this, Mr. Chairman. It shows what the Ordnance Bureau did. I will just offer it for the record.

The CHAIRMAN. Yes.

(The document referred to is here printed in full in the record, as follows:)

GENERAL SUMMARY OF WAR ACTIVITIES, 1917 TO 1918.

(Statement prepared for use before the Senate Investigating Committee.)

NAVY DEPARTMENT,
BUREAU OF ORDNANCE,
Washington, D. C., April 26, 1920.

1. On December 23, 1916, Commander Ralph Earle, United States Navy, then on duty as inspector of ordnance in charge, Naval Proving Ground, Indianhead, Md., relieved Rear Admiral Joseph Strauss, United States Navy, as Chief of the Bureau of Ordnance, holding this post until May 1920.,

2. Under date of May 28, 1915, an order was prepared by the Chief of Naval Operations and signed by the Secretary, forwarding report of the General Board, No. 425, directing compliance of the Bureau of Ordnance with requirements of a letter from the General Board, dated March 13, 1915, which requirements were that each office and bureau be furnished with part of the plan for preparation of war, in so far as pertained to its own duties, and that it be directed to report, not later than one month and thereafter at the end of each calendar quarter, the progress made in work of preparation and comments upon any defects in the plan which might make its execution impracticable or that seemed to be cumbersome. This started the method of quarterly reports of preparedness to the department and made known to the bureaus' requirements in concrete form.

3. The first actual operations undertaken by the bureau with success, looking toward an eventual state of war, were included in the appropriation act of August 29, 1916, wherein an allotment of money was made for batteries for merchant auxiliaries, for reserve ordnance supplies, and for ammunition for ships of the Navy.

4. The bureau, under date of July 10, 1916, anticipating the passage of the act referred to, advertised for a total of 943,429 projectiles of all calibers.

5. The early days of February found the bureau requesting additional funds for probable undertakings. On February 3 the bureau requested the Chief of Naval Operations to secure immediate availability of the funds incorporated in the naval appropriation bill then before the Senate. The 5th of February the bureau submitted additional items for the appropriation bill, and on February 7 secured \$15,000,000 additional for ordnance. On February 22 the need for these funds was explained to the committees of Congress, and the funds as desired were appropriated in the act approved March 4, 1917.

6. The letter of the department approving the war plans of March 13, 1915, pointed out the steps to be taken by the department before the war—the mobilization of the blue forces in the Atlantic and the assignment of public vessels to naval districts and local defense, together with the composition of the A, B, and C fleets. The assignment of guns to auxiliaries was included in these plans, so on February 3 the necessary shipment orders for such batteries were made.

7. On the afternoon of February 3, 1917, when word was received that diplomatic relations with Germany had been broken, the Navy Department directed that the batteries held in reserve for assignment to merchantmen and auxiliaries be shipped to the fitting-out yards of the vessels concerned. The necessary shipment orders—some 60—were gotten out by the Bureau of Ordnance on the afternoon of that day.

8. On March 12, 1917, the President notified all foreign Governments of his intention to arm merchantmen whose voyages took them into seas infested by German submarines.

9. The Secretary of the Navy and Admiral Benson, Chief of Naval Operations, directed the Bureau of Ordnance to proceed as expeditiously as possible with the arming of these merchantmen. The Secretary, on March 13, 1917, issued regulations governing the conduct of armed American merchant vessels. The Secretary approved the plan of obtaining the guns required, in addition to those held in reserve batteries for that purpose prior to the war, by removing certain guns from vessels of the fleet in cases where they could be properly spared in view of the necessity of quickly arming the vessels involved.

10. The Secretary of the Navy authorized the bureau to proceed at full speed to make contracts for guns and mounts, and, during March, April, and May, the following firms, who had never made ordnance material of any kind, were induced to start the manufacture of guns, forgings, and mounts:

Root & Van Dervoort, East Moline, Ill.
 Poole Engineering Co., Woodberry (Baltimore), Md.
 American Radiator Co., Bayonne, N. J.
 Linderman Steel & Machine Co., Muskegon, Wis.
 Ohmer Fare Register Co., Dayton, Ohio.
 Mead-Morrison Manufacturing Co., Boston, Mass.
 Mason Machine Works, Taunton, Mass.

11. Among other early actions of the war was the Navy's effort to push the development of machine guns in the United States, so as to obtain at the earliest possible moment quantity production of such guns adapted to use American ammunition. This was especially the case with the Lewis gun, and it was due to the Navy that such a gun was produced by the Savage Arms Co. satisfactorily by April 18, 1917. Funds for the development of machine guns, under "Experiments, Ordnance," were available early in February, 1917, and contracts were given in that same month. The contracts for various machine guns used during the war were in large measure made by the 27th of April, 1917. One of the large later contracts was made on the 17th of September, 1917, but the capacity of the small-arm firms had been utilized to the utmost during the interim.

12. Many contracts were signed for various guns for merchantmen, new destroyers, sub chasers, and other patrol boats, through April to June, amounting to the following:

Guns.

	April.	May.	June.	Total.
6-inch.....	30			30
4-inch.....	150	1,000	1,000	2,150
3-inch.....	1,570	300	210	2,080
6-pounder.....	154			154
1-pounder.....	1,200			1,200
Machine guns.....	5,100		350	5,450
Total.....				11,064

Part of the 3-inch gun contracts included both guns and mounts; i. e., those for sub-chasers. 5-inch guns were being manufactured at the Naval Gun Factory at rate of some 10 per month, increasing later to 18.

Mounts.

	April.	May.	June.	Total.
6-inch.....		62		62
5-inch.....	105			105
4-inch.....	309	910		1,219
3-inch.....	200	1,170	42	1,412
6-pounder.....	154			154
Total.....				2,952

13. Between January 1 and June 30, 1917, the Navy had work proceeding and contracts made for guns, mounts, and machine guns amounting to the following totals:

Guns.....	6,034
Mounts.....	3,182
Machine guns.....	6,955

This involved about \$56,938,306.04. All of this work was undertaken under instructions and knowledge of the Secretary, although no funds were as yet available to pay for the same.

14. As indicative of the desire of the department to meet the new conditions arising in the war against submarines, it can point to the fact that the 110-foot sub. chasers were built only strong enough to carry the service 6-pounder gun, but the department wisely decided that this gun was not of sufficient caliber to make an impression on a submarine and, therefore, the Ordnance Bureau not only designed an entire new gun and mount of the 3-inch caliber for this purpose, but actually had such in production during April and May, 1917.

15. It had been demonstrated in 1916 that German submarines could operate successfully at such distances from their bases as to permit of their crossing the Atlantic and bringing their submarine warfare to our coasts. Defensive measures to guard against this contingency in advance of an actual declaration of war were, therefore, not overlooked. Immediately after the proclamation of the restricted submarine warfare, in the first week of February, 1917, wire rope was obtained from all possible sources in the country and issued to all naval districts and the Army, for use in the construction of net defenses against submarines at our important ports. Instructions as to the fabrication of such nets were issued from the bureau. In a short time the harbors of New York, Norfolk, and Newport were well protected by heavy nets laid across the harbor entrances.

16. The European war had shown that nets were a necessary protection against submarines, and the bureau had experimented with various types and placed contracts for one 4,500-foot net for final determination of type. The nets under consideration included towing and trap nets, and altogether the bureau had orders placed for some 126,112 feet of steel netting and had included an estimate for Congress for 100 miles of heavy net material and 200 towing nets.

17. On the afternoon of February 3 the bureau received notice that diplomatic relations with Germany had been severed. The bureau then issued orders to assemble the batteries set aside for merchantmen and to ship them in accordance with the war plans of the department, accessible in its safe. It also sent out orders to the ammunition depots and gun factory, torpedo stations and proving ground, to at once increase force, rush work, and to establish additional safeguards for manufacture of material.

18. On February 5, all the bureaus' chiefs requested a \$500,000,000 allotment, in order that there might be a minimum amount of delay in commencing manufacture of war material.

19. On February 9, the bureau sent a 3-inch battery to the torpedo station at Newport for its defense against any possible raiding by submarines. On March 31, eight 5-inch guns were shipped to the Virgin Islands, for the protection of those islands, which had recently been acquired by the United States. From time to time batteries were sent to outlying air stations of the Navy for their defense. On April 7, mobilization was ordered by the Navy Department and the Coast Guard was included in these orders, additional batteries and guns being furnished vessels of the Coast Guard Service where needed. On that date, we also secured orders from the War Department enabling the bureau to prescribe danger zone at Indian Head, so that proof firing could go on without interruption. On April 13, it was decided to rush work on the projectile plant, especially because of the fact that private manufacturers were not meeting success in manufacturing armor-piercing projectiles of the 14-inch caliber.

GUNS.

20. The greatest task facing the bureau, so far as guns were concerned, was that of turning out guns in time to equip destroyers and sub. chasers of the new building program, and at the same time equipping all the various patrol vessels, together with all the merchantmen that must be armed.

21. At the beginning of the war there were available—not actually mounted on board ship—319 guns of caliber from 3 to 6 inches; smaller than 3-inch there were but 314; and in the hands of the Naval Militia there were 57 guns of calibers from 3 to 6 inches.

There were several outstanding gun contracts of calibers suitable for arming merchantmen existing prior to 1917. There were contracts for:

67 4-inch guns, Bethlehem Steel Co. (No. 2536, dated Oct. 31, 1916).

100 4-inch guns, American & British Manufacturing Co. (No. 544, of Nov. 18, 1916).

146 5-inch guns, Bridgeport Projectile Co. (No. 607, dated Nov. 13, 1916).

Deliveries on these contracts were not realized, and the chief of bureau upon investigation early realized that deliveries on these would not be made in time to be of use to the Navy, and so did not hesitate to place contracts for guns with firms that could and would produce them in sufficient time. For example, on the 3d of May, 1917, he placed contract for 1,000 4-inch guns with the Root & Van Dervoort Engineering Co., East Moline, Ill., a concern entirely new to this type of manufacturing work, yet one that put its shoulder to the task and delivered material.

Of the contracts just mentioned as existing, there were but nine 4-inch guns delivered by the Bethlehem Steel Co. up to the 1st of April, 1918; two delivered by the American & British Manufacturing Co. up to that date, and no 5-inch delivered by the Bridgeport Projectile Co. at all. It was necessary to commandeer the plant of the latter concern and manufacture the guns there ourselves. Nine months is the shortest time in which, after an order is placed, a naval gun of caliber from 4 to 6 inches can be delivered.

22. The Bureau of Ordnance also had to meet calls from the Italian Navy for 5"/51 caliber guns in the critical days after Caporetta retreat; supply merchant vessels operating under the flags of the Allies, the French patrol and fishing vessels; all of these in addition to our own vessels, including also heavy turret guns for Great Britain's Navy.

23. Altogether the Bureau of Ordnance placed in service on merchantmen and delivered to the Allies a total of 4,843 guns, 2,050 of which were of calibers from 3 to 6 inches, inclusive. There were 1,742 vessels other than those of the Regular Navy; these, in themselves a large number, furnished with guns.

24. Special types of guns produced by the Navy during the war were the "Y-gun," invented, manufactured, and issued in quantity, and the 3"/23 gun, also newly designed for sub. chasers. Both these types of guns were new in every respect and were produced to meet a need that did not exist prior to the declaration of war. Then, also, there was produced a most superior antisubmarine weapon in the shape of the 8-inch howitzer.

25. Many difficulties, in production of guns and gun forgings, were overcome by the cooperation and assistance of the Navy Department. In this connection, as in everything to do with steel and gun production, the Bureau of Ordnance was materially helped by the production division of the War Industries Board, headed by Mr. S. M. Vauclain, of the Baldwin Locomotive Works. As one instance, the Navy Department took charge of a gun-forging plant, the output of which had been unsatisfactory and increased its output of satisfactory gun forgings, 300 per cent within the first two months of governmental, or rather naval, operation.

26. Rear Admiral Plunkett on March 26 made a statement somewhat as follows:

"In fact, I do not remember just when we conducted her firings, but we fired all of those 14-inch gun ships, the *Pennsylvania*, the *Oklahoma*, the *Arizona*, and the *Nevada*, in order to find out what caused the tremendous dispersion of our guns; and we have also conducted experiments ever since then—that was in 1916—and we are no nearer the answer to-day than we were then. One reason for it, I think, is due to the fact that when Congress practically offered us a proving ground to cost \$10,000,000, the Secretary only allowed \$1,000,000."

That Congress practically offered a proving ground to the Navy costing \$10,000,000 is certainly news to the Bureau of Ordnance and I feel sure that it will be so to all Members of Congress. So far was it from being a fact that it took strenuous efforts to obtain the \$1,900,000 actually allotted. It was hard to convince the House Committee on Naval Affairs that it was really necessary for the Navy to start new projects, and thus it was exceedingly difficult to convince this committee that the Navy really did need extended facilities for the proof of ordnance material.

27. As a matter of history, it is noted here that the proving ground at Indian Head, under the Bureau of Ordnance, was established there in 1891. It soon became entirely too small for the Navy's needs. The Navy looked ahead into the future, anticipated its needs, and for several years prior to 1911 did its best to secure extended facilities for the proof of ordnance material. Detailed plans were finally drawn up and submitted with estimates for 1912, but these were not received with favor, so that the Navy had to manufacture heavy ordnance without being able to test it properly. The officers of the Bureau of Ordnance continually endeavored to obtain appropriations for a proper proving ground. Effort to obtain a long land range was given up

after a search, when it was found that sufficient land for a 40,000-yard range, the minimum desired, could not be obtained for less than \$2,500,000. Congress was then asked for only a water range. Every effort was made to obtain an authorization but the bureau was not successful until April 26, 1918, when it obtained \$1,000,000 for establishing a project like that for which \$11,000,000 had been allotted to the Army. For the completion of the Navy's range at Dahlgren, Va., the Appropriation Committee later allowed \$900,000 additional, making a total available of \$1,900,000. Six hundred thousand dollars more will be required, however, before the completion of the project; and, it is expected confidently that such an amount will be readily granted by Congress, especially in view of the urgency and importance of the project. This range is being utilized now in the hopes that we may reduce the dispersion of our guns before they are all built, although it is not entirely satisfactory because of the small allowance of funds. Nevertheless it is true that we have a water range and a land range that is sufficient to recover, at the present time, the particular shell desired for examination after firing.

28. Despite every handicap, the result of our long-range firing on shore in France showed that our guns were remarkably accurate; and, further, that our fuzes functioned exceedingly well; in fact, they gave 100 per cent performance.

29. The records show that for ranges from 13,000 to 15,000 yards the dispersion as determined at the proving ground was not excessive for 12-inch, 14-inch, and 16-inch guns.

30. A table of these dispersions follows:

Dispersion results, Naval Proving Ground range, 13,000 to 15,000 yards, up to January, 1918.

	Number of shots.	Weight of shell.	Original of shell.	Dispersion.
		Pounds.		Yards.
12"/45 inc. twist.....	16	870	7	± 79
Do.....	3	700	5	± 44
Do.....	2	740	4	± 72
12"/50, inc. twist.....	19	870	7	± 81
Do.....	3	700	5	± 38
Do.....	3	740	4	± 98
12"/50 uniform twist.....	16	870	7	± 50
12"/50 inc. twist.....	16	870	7	± 74
14"/45.....	188	1,400	7	± 40

16"/45.....	24	2,100	7	± 69

¹ A. P.

² Target.

³ Class B.

⁴ Midvale target.

31. It was only after attempts to fire at greater ranges were made that excessive dispersion was encountered, as is shown by the records of firing of the *Nevada*, *Oklahoma*, *Pennsylvania*, *Mississippi*, and *New Mexico*.

Ship.	Mean dispersion.	Range.	Remarks.
	Yards.	Yards.	
Nevada.....	301	17,600	Excessive.
Oklahoma.....	370	20,000	Do.
Pennsylvania.....	128	19,000	Very good.
Mississippi.....	650	21,000	Excessive.
Do.....	80	24,000	Excellent.
Do.....	250	28,000	Excessive.
New Mexico.....	280	18,000	Do.

32. From information obtained concerning British battleship target practice, it appears that their mean dispersion at 20,000 yards is about 115 yards.

33. As soon as it became apparent that ranges exceeding 15,000 yards would be used in battle, steps were taken to obtain a proving ground where long-range firing could be conducted.

34. In the meantime long-range firings have been conducted by various ships. It should be noted, however, that certain data necessary to the determination of the

causes of dispersion can not be obtained in ship firing; for example, muzzle velocities and jump card determination of the character of flight of projectile. Valuable interior ballistic data, however, have been obtained from these firings leading to improvement in ignition and loading.

35. Experiments have also been conducted with a view of determining a more satisfactory type and twist of rifling. Other experiments are under way looking to an improvement in form of rotating bands.

36. Our guns and powder appear to be fully equal or superior to any foreign guns and powder. There is every indication that improved flight of projectiles resulting from the before-mentioned experiments will make our dispersion compare most favorably with that of any foreign navy.

37. The steps taken by the bureau to see that a sufficient supply of projectiles was on hand for all calibers of guns proved satisfactory, and at no time was any real worry experienced, except in regard to the shells of 14-inch caliber. The condition in regard to shell of 14-inch caliber was that the shell rooms of all ships in commission carrying that caliber were filled, but, that there was not a reserve supply ready for issue in shell houses at ammunition depots.

38. Capt. H. Laning, appearing before the Senate committee on March 23, 1920, stated in part the anxiety concerning these contracts that was felt by the Bureau of Ordnance at that time. The records disclose the fact that at the time of the declaration of war the Bureau of Ordnance was greatly concerned over the question of the supply of 14-inch projectiles. There had been great difficulty on the part of manufacturers in meeting the severe specifications. This fact, together with industrial conditions and the necessity for providing additional facilities, brought about an impasse over the price to be paid under new contracts. Contract had been made in February, 1917, for such projectiles at \$500 each. The new price was \$592 each. The price finally agreed upon and embodied in new contracts dated June, 1917, was \$580 each, a reduction, due to negotiations, of \$12 per projectile. Twenty-two thousand one hundred projectiles were ordered at this price, showing a saving of \$265,200.

39. In the meantime, no delay in production occurred, as the Secretary had directed the manufacturers to go ahead and that a price adjustment would be made effective as early as possible. One lot of 14-inch arrow-point projectiles which under the contract was required to be delivered in February, 1918, was actually delivered in June, 1917, and further deliveries were made so that by October, 1917, projectiles were being delivered which were not due for delivery under the contract until September, 1918. Thereafter no further concern was experienced regarding this case of war necessity.

40. Under date of July 7, 1917, the Chief of the Bureau of Ordnance reported in regard to the supply of this caliber of projectiles that deliveries had then been made and progress of manufacture "has removed a great anxiety felt by the bureau as to providing such shell."

41. Of course, all in the department realized that this projectile shortage was really more theoretical than practicable, because the naval war had continued for two years and eight months with no engagement in which the ships' allowances of major caliber shells had been expended. Conditions did not indicate another fleet action, even though the United States should go into the war, and the whole past history of the naval war showed that there could be no urgent or hurried need for projectiles that was so great as to cause the department to accept an inferior projectile or to pay an exorbitant price for any type. At one time it looked as if the department could not get shells of 14-inch caliber of the standard it wished, no matter what price it paid, and its reluctance to accept inferior projectiles was one of the reasons why the shell contracts were not placed earlier.

42. The department approved of procuring an additional reserve—shells for all calibers of guns—immediately after the breaking of diplomatic relations in February. This additional reserve was never completely obtained and since the armistice it has been decided to adhere to the reserve specified in the department's war plans.

43. Among the special type shell developed by the Bureau of Ordnance and supplied during the World War was found the nonricochet high-explosive shell, which was very successful when used in such high-velocity guns as the 5"/51 caliber.

SMOKELESS POWDER.

44. As in the case of projectiles, an additional reserve was authorized and steps taken at once to acquire the same. The following table shows the powder situation December 1, 1916, and April 1, 1917, showing that ample powder was on hand at all times:

	Pounds.
December 1, 1916:	
Allowance for guns on hand.....	20, 235, 390
Reserve for above.....	30, 353, 085
Total.....	50, 588, 475
Total powder on hand ashore and afloat.....	48, 291, 544
Shortage.....	2, 286, 931
April 1, 1917:	
Allowance for guns on hand.....	20, 829, 140
Reserve for above.....	31, 243, 710
Total.....	52, 072, 850
Total powder on hand ashore and afloat.....	50, 726, 269
Shortage.....	1, 346, 581

TORPEDOES.

45. Capt. Laning's statement, made to the committee on March 23, 1920, sets forth the shortage of torpedoes. Here, again, it was a case of negotiating for manufacture of torpedoes at a price considered reasonable to the department. Evidently there would be, during the war, no large demand for torpedoes, and this estimate of the situation was justified by developments as the war went on. Negotiations did not delay actual production of torpedoes, as they did not delay actual production of shells, although the difficulties and delays met with in placing of such contracts worried both the chief of bureau and the Secretary of the Navy greatly. As far as torpedoes went, it looked as if the submarines and destroyers would be completed before they could be equipped with torpedoes. However, the vessels were delayed, as were also delivery of the torpedoes, and hence no actual delay resulted.

46. The manufacture of torpedoes is such an intricate and time-consuming matter that unless the war were to have been a long one it scarcely could have been hoped that torpedoes ordered at its beginning could be completed at such times and in sufficient numbers as materially to aid in the prosecution of the war.

47. Under date of November 10, 1916, a price of \$9,500 each was quoted for Mark VIII, Model 3, 21 feet by 21 inch torpedoes, and a price of \$8,150 each for Mark X, Model 5, 5 meters by 21 inch torpedoes. As a result of further negotiations reduction was made to \$9,163.84 and \$7,815.84, respectively.

48. Under date of April 4, 1917, however, by direction of the Secretary of the Navy, the price to be paid for these torpedoes was fixed and an order given at \$7,922 and \$6,140 each, respectively. Contracts were placed in April, 1917, for 952 torpedoes at \$7,922 each and 344 torpedoes at \$6,140 each, an indicated saving from the original quotation of \$2,193,696.

49. A further contract for 876 torpedoes was placed in the same month at \$7,922 each, indicating an additional saving over the original price of \$1,382,328, a total saving in the price of torpedoes ordered at that time of \$3,576,024.

50. There being no spares of the heavy portions of turret mounts on hand, on January 1, 1917, the Bureau of Ordnance immediately took up the problem of procuring the large castings and the structural steelwork necessary in order to insure that, if a turret of a battleship should be damaged by shell, there would be on hand material necessary for its rehabilitation with the least delay, for otherwise six months would be required to fabricate such parts as slides and lugs. The Secretary of the Navy promptly approved these steps, and manufacture started upon the necessary items at once.

DEPTH CHARGES.

51. Prior to April, 1917, practically no information could be obtained in this country relative to depth charges and their use in the war against submarines. In fact it was only in February that any real information as to their use became available. This information indicated that small—that is, when considered in light of later knowledge—depth charges were being used from destroyers and patrol vessels against submarines. In other words, they were a war material only coming into being during 1917. The bureau, then, in the very earliest days of 1917 started at work intensively on the design of depth charges. Depth charges we learned in April were very scarce

abroad, due largely to the scarcity of high explosive, and their use much restricted accordingly. The substitute high explosive used was not entirely satisfactory.

52. Soon after the entry of the United States into the World War, the Bureau of Ordnance arranged for a supply of 10,000 50-pound depth charges of a somewhat complicated type as compared with later practice. The contract for these was let May 22, 1917; but before deliveries in quantity commenced messages from abroad indicated that this type of depth charge was too light to be very effective and too complicated to be certain in action. It was recommended that a heavier depth charge, similar to those recently designed and constructed by the British, be supplied to our antisubmarine forces. This recommendation was dated June 20, 1917, and in accordance therewith on July 30, 1917, a contract for 10,000 depth charges of the general type indicated with 300 pounds explosive charge was let. The design of these depth charges, however, differed in several respects from British practice in the direction of greater safety in handling and greater robustness.

53. As early as August, 1917, the Bureau of Ordnance in a memorandum in regard to the supply of depth charges gave its opinion that eventually not less than 40 depth charges should be supplied to each destroyer engaged in antisubmarine work. This continued to be the bureau's opinion in spite of the fact that September 1, 1917, Admiral Sims cabled that the depth charges contracted for would suffice for six months. Later in the same year the Bureau of Ordnance offered to supply additional depth charges according to British designs for use by British destroyers, and on December 13, 1917, a contract was let for 15,000 such depth charges.

54. Deliveries on the first 10,000 orders were about half completed by the first of the year, and all these charges became available for issue to ships for transport to bases abroad before the 1st of March. Meanwhile, anticipating the increased supply of both United States and British depth charges, a policy was outlined January 7, 1918, by Admiral Sims calling for a more liberal use of depth charges and increasing storage space on destroyers so as to raise the number of ready depth charges from 16 to 26. As late as the previous month the supply of depth charges had been sufficient to issue 10 to each destroyer with additional in store at overseas bases for replacements. The more liberal policy in treatment of depth charges as expandable if even a fair chance of damaging an enemy was thought to exist caused an additional order for 5,000 United States depth charges to be made March 12, 1918; and following further emphasis by Admiral Sims in a circular letter of April 19, 1918, to all forces under his command an additional contract for 15,000 was let April 29, 1918.

55. Deliveries on the principal contracts were seriously delayed during the spring of 1918 by strikes at the manufacturers' plant in St. Louis; and anticipating that expected deliveries would not be met the Bureau of Ordnance July 3, 1918, let still another contract for 10,000 depth charges of the United States type. On July 8, 1918, Admiral Sims recommended the use of United States design depth charges in place of British design, even on British vessels, for use in Thorneycroft throwers, on account of several accidents which had occurred in handling the British type with this projector. The Bureau of Ordnance immediately took steps to insure a sufficient supply by letting two more contracts for 10,000 each on July 19, 1918.

56. By this time it was a settled policy that destroyers engaged in antisubmarine work should be able to carry 50 depth charges, about half ready for use; and the numbers under contract at this time showed that this was possible, provided the depth charges could be shipped rapidly enough. During July, 1918, production on the various contracts steadily increased, and difficulty began to be experienced in obtaining necessary cargo space for greatly increased supplies to overseas bases. Many shipments were delayed by lack of carriers, the first large shipment during July being 1,000 of the British type shipped on the 25th. A further shipment of 1,000 United States depth charges went forward on August 3; and from this time until the end of the war the supply of ships kept approximately even with the supply of depth charges, so that a total of about 25,000 depth charges had been supplied to our forces at home and abroad by November 11.

57. Thus it is seen that not until after we entered the war—that is, April 6, 1917—did any inkling come to the Bureau of Ordnance as to the necessity of using depth charges heavier than 50 pounds, and not until long after that did any depth charge designs arrive in this country from Great Britain. When they did arrive the Bureau of Ordnance's own depth charge designs had been completed, and firing devices according to our development were put in production in preference to the designs received from the British Admiralty; this after careful consideration of the matter. That our action was right is proved by the fact that not one month later did we receive notice from the British Admiralty that depth charges made according to the designs forwarded to us were unreliable and inefficient, and had been given up for a new type because they were not sufficiently safe to handle or certain in their action.

58. It will be noted also in the above that it was the United States that permitted the extensive use of depth charges against submarines by assuring supply of depth charges in unlimited quantities to its own antisubmarine craft, as well as helping out supplies of the British antisubmarine craft. We believe that while a large stock ahead was never accumulated, still there was always sufficient aboard destroyers operating.

NEW EXPLOSIVES.

59. The bureau early realized that it could not continue any extensive depth charge or mining program and use T. N. T. therein without seriously embarrassing both our Army and the Allies for lack of that material in shells. The bureau was not satisfied with the substitute explosive used abroad—that is, amatol—as reports of the action of this explosive were not at all reassuring. Therefore the bureau developed a new explosive called trinitroxylol, and put it in manufacture so that satisfactory high explosive for any depth charge or mining program—no matter how great—that might be undertaken would never suffer from lack of explosive therefor.

SMOKE SCREENS.

60. Among the essentials for antisubmarine work was found to be the providing of merchant vessels with smoke-producing apparatus, which could be used in various ways, either from containers thrown on the water, emitted from special funnels provided aft, or thrown out by the vessels' own funnels. The material we provided was found in general to be satisfactory, due largely to the work done by the Bureau of Mines, Interior Department, at the request of the Bureau of Ordnance, Navy Department.

NEW DEVELOPMENTS.

61. The bureau carried out in time, and in a way generally as expeditious and satisfactory as possible, the development of many new devices of ordnance material such as noxious gas shells, star shells, and flashless powder.

AVIATION ORDNANCE.

62. The Navy Department was working along various lines of arming aircraft for offensive and defensive purposes in the fall of 1916, and in November of that year tried certain bombs for use against submarines in much the same manner as our depth charges, only necessitating a more complicated firing mechanism. Such bombs were not altogether satisfactory at that time and required further development. The greatest handicap—this was the controlling factor—to development of ordnance for aircraft was the difficulty of obtaining aircraft with which to test ordnance material. Nevertheless during the war the bureau supplied nonrecoil guns of a type suitable for sinking submarines sighted by aircraft when on patrol, originated a method of securing a machine gun to the larger gun in order that it might act as a finder for the larger gun. This method is now being generally adopted for aircraft guns by both the Army and the Navy. The pilot directing sight was developed by our Navy, and eventually was added to by improvements developed in practice abroad, with the result that the present bombing sight is considered quite satisfactory, although of course development is being pushed in line of improving this steadily. The Navy also took charge of the development of a new weapon of the air, which weapon depended upon aircraft, and which is still being held confidential.

OPTICAL INSTRUMENTS.

63. Rear Admiral C. P. Plunkett, United States Navy, on March 26 made the following statement before the Senate Investigating Committee:

"The question of range finding was taken up seriously. Up to 1915 we had comparatively no efficient range finding instruments. These are instruments of prime importance, and at the outbreak of the war we had only a sufficient number of them for our first line ships. The ships in reserve had practically no range finders worth mentioning."

STATUS OF RANGE FINDERS—WORLD WAR.

64. There were on hand in the Navy on April 6, 1917, the following range finders:

Long base (20 feet).....	24
Intermediate base (9 feet, 12 feet, 15 feet).....	130
Short base (1 to 1½ meter).....	234

After we had entered the war the Bureau of Ordnance sent an officer to Europe to compare the optical range finder of the Allies with those manufactured by the United States. This officer reported on the British range finders as follows:

"Range finders—United States Navy is better, but will not be when British get new 30-foot instruments."

French Navy: "Optical material is not as good as the British."

Italian Navy: "* * * optical material in the Italian Navy does not compare with the British."

Japanese Navy: "Judging by the policy which the Japanese Navy pursues of buying a few instruments from manufacturers of any note in every country where possible, I am of the opinion that her optical instruments compare favorably with those of the British Navy and the United States Navy."

From the above it will be seen that the Allies obtained most of their range finders from Barr & Stroud Co. in England so that a comparison of the American range finders with the best range finders made by Barr & Stroud will give us an idea of the efficiency of our range finders as compared with that of our allies.

65. Early upon our entrance in the war we sent our best portable range finder, a 20-foot Bausch & Lomb instrument to England for the purpose of having the British Admiralty compare our instrument with their best Barr & Stroud instrument. We had better and longer based instruments at that time installed in the turrets of some of our latest ships, but it was impracticable to send one of these. The 20-foot instrument we sent was put on test against a 15-foot Barr & Stroud instrument, which was the best instrument at that time in the British Navy. A comparative test of the two instruments was reported upon by the captain of H. M. S. *Excellent*, Portsmouth, England. The tests were made by operators who had had several years range-finding experience in a large ship. The result of the tests shows United States instruments to be superior to the best instruments in use in the British Navy. The complete data on these tests gives all the readings made by the two range finders and shows the superiority of the American instrument over the British.

66. The American naval officer's report on range finders used in the British Navy contained the following interesting statement:

"At the beginning of the war the British began to fit the latest ships with Barr & Stroud 15-foot instruments, the standard instrument in use up to this time being the 9-foot Barr & Stroud, a number of which we have in the United States Navy (Mark II). At the Battle of Jutland, in spite of the early reports to the contrary, I have been informed that there were thirty 15-foot range finders in the British Fleet, five each on four ships of the *Queen Elizabeth* class and five each on two ships of the *Revenge* class."

The above quotation from Commander Orr's report shows conclusively that as regards range finders the American Navy was superior to all of the Allies.

67. We have had no means of comparing our range finders with those used in the German Navy, for the reason that we have been unable to procure any German range finders. Prior to the war the glass and optics used in the manufacture of our range finders came from Karl Zeiss, of Jena, the manufacturer of the range finders for the German Navy.

68. Each first-line battleship of the active fleet contained at least one 20-foot range finder or better, which was superior to the best range finders mounted in the British fleet, the British carrying 15-foot range finders.

69. In addition to these range finders, the United States, beginning with those ships commissioned in 1914, had range finders installed in turrets. This was a distinct advantage over the mounting of range finders in other navies, in that the range finder is protected by the turret in which it is mounted and contains a base slightly greater than the width of the turret.

No navy had any such range finders as those which we had mounted in the ships beginning with the *New York* and *Texas* and continuing through the *Oklahoma*, *Nevada*, *Arizona*, and *Pennsylvania*. All the ships mentioned were commissioned before the war and all of them contained long base range finders in the turrets, those in the *Arizona* and *Pennsylvania* being 25 feet in length. After we entered the war, the battleship *Mississippi* was commissioned and in this ship 30-foot range finders were installed in the turrets. The British had no range finders during the war that could compare with those and only since the war are they mounting in their new H. M. S. *Hood* a range finder equal to that installed on the *Mississippi*. Our ships in reserve in the second line before the war had range finders of the base length equal to those of the British.

Battleships as of July 1, 1917.—Indiana, Massachusetts, Oregon, Iowa, Kearsarge, Kentucky, Illinois, Alabama, Wisconsin, Maine, Missouri, Ohio, Virginia (one 20-foot, one 12-foot, two 3-inch), Nebraska (one 20-foot, one 12-foot, one 3-inch), Georgia

(one 15-foot, one 12-foot, one 9-foot), New Jersey (one 12-foot, two 3-inch, one 9-foot), Rhode Island (one 12-foot, one 3-inch, one 9-foot), Connecticut (one 20-foot, one 15-foot, one 12-foot, one 3-inch), Louisiana (one 20-foot, one 12-foot, two 3-inch), Vermont (one 20-foot, one 12-foot, two 3-inch), Kansas (one 20-foot, one 12-foot, one 3-inch), Minnesota (one 20-foot, one 12-foot, one 9-foot), New Hampshire (one 3-inch, one 20-foot, one 12-foot), South Carolina, Michigan, Delaware, North Dakota, Florida, Utah, Wyoming, Arkansas, New York, Texas, Nevada, Oklahoma, Pennsylvania, Arizona, New Mexico, Mississippi, Idaho, Tennessee, California, Colorado, Maryland, Washington, and West Virginia.

Eleven ships in second line. Total range finders on them were—20-foot, 8; 15-foot, 2; 12-foot, 11; 9-foot, 4; 3-meter, 13.

OPTICS.

70. During the period from 1913 to 1917, the Bureau of Ordnance obtained all of its optical instruments from two firms in this country. While these firms fabricated the instruments themselves they were dependent upon Europe, principally Germany, for their supply of optical glass. The outbreak of the war in Europe during 1914 practically shut off the foreign supplies so that the manufacturer saw themselves helpless for raw material unless something was done in this country. However, influenced by the cost and lack of knowledge as to manufacture of optical glass and buoyed up by the hope that the war in Europe would be of short duration, these manufacturers depended upon their reserve stock of glass to see them through until such time as new supplies would be available. As the war went on, however, these companies attempted laboratory experiments in a very small way with the object of making glass. Such were the conditions as existed when we entered the World War, the first part of 1917. It was immediately recognized that the first step in the solution of the supply of optical instruments necessary was to provide a supply of glass of high quality. The Bureau of Ordnance's initial move in this direction was to secure an allotment to the Bureau of Standards, of a sum of money sufficient to establish an optical glass plant, of small capacity, but operating on the manufacturing production basis. Orders for optical glass were placed with several companies which agreed to attempt to manufacture such glass. The result of these efforts was that before many months passed the production of glass which has been measured in quantities of a few pounds was being produced by tons, the product improving in both quality and quantity. At the end of the war in November, 1919, there were five large producers of optical glass supplying glass to the Navy, where in 1913 there were none.

71. As stated there were only two companies supplying optical instruments in 1913, and the Navy in its own industrial yards had nothing but small plants devoted exclusively to repairs. By the end of 1917, the bureau had succeeded in getting the two original producers to nearly double their output and, in addition, had succeeded in getting seven other manufacturers to work on instruments for the Navy. In one case where the contractor got into difficulties that prevented satisfactory deliveries, the Bureau of Ordnance promptly took over the plant, operated same, supplied the Navy's needs for binoculars and, in addition, made deliveries to the War Department. A building was also started at the Naval Gun Factory in Washington for the purpose of establishing an optical plant there, but owing to priority being given to other work, the building was not completed until the end of the war.

72. The armistice naturally has produced the vast demands for optical instruments and consequently nearly all of the plants have turned their efforts to commercial work. However, the Navy will never be in the position it was in 1913, for a thoroughly equipped optical shop is now in operation at the Naval Gun Factory and while present capacity and output is small, there is a complete nucleus available for rapid expansion in case of necessity for the increase of capacity.

73. To sum up, the bureau has freed itself from the dependency upon foreign makers for optical glass as existed in 1913, and through its own optical shop has a capacity to extend readily, and has nearly four times as many commercial plants capable of doing its work as it had in 1913.

74. In its production of optical instruments, the Navy Department was certainly not behind other departments of the Government or of foreign Governments. As one witness to this, during the war the Signal Corps of the Army had placed contract with the Navy for 75,000 binoculars, which binoculars were in the course of being delivered at the cessation of hostilities. The production of binoculars and other optical instruments was all plain sailing by the end of the war and was due to energetic efforts of the technical officers concerned. For example, a private plant making binoculars, and delivering but 100 acceptable pairs per week, having 75 per cent of each week's

output failing to pass naval inspection was taken over by the Bureau of Ordnance, placed under its direct control, and was, within a month, delivering 1,000 pairs of binoculars each week, all of the highest grade.

MISCELLANEOUS ACTIVITIES OF THE BUREAU.

75. The Council of National Defense, during the early months of 1917, established certain subdivisions to coordinate war-like activities, this bureau dealing with the munitions board under that body. That board was desirous of obtaining an industrial inventory of the Nation, and found, upon inquiry, that this bureau had anticipated this need by many months, and was able to furnish a complete list of industrial commercial firms, giving their location, capacity, and war responsibilities. This was a confidential compilation of the bureau showing the facilities existing in the United States for the manufacture of projectiles, explosives, guns, cartridge cases, fuses, detonators, torpedoes, mines, nets, optical instruments, and other war materials. All firms were listed by name and address, their capacity and other characteristics being set forth.

76. The bureau had standard forms of contracts, handled business in a routine manner, and adhered closely to the competitive bidding system for procuring supplies.

77. Among the bureau's measures in this war period was the effort made by it, alone, to secure the enactment of a law, by which Congress authorized advance payments to contractors of a sum not exceeding 30 per cent of the contracts awarded them. This provision was most necessary, and its enactment certainly saved the day for Navy ordnance.

78. As a result of the bureau's urgent recommendations, the deficiency act of October 6, 1917, provided for advanced payments in the following language:

"SEC. 5. That the Secretary of War and the Secretary of the Navy are authorized, during the period of the existing emergency, from appropriations available therefor, to advance payments to contractors for supplies for their respective departments in amounts not exceeding thirty per cent of the contract price of such supplies: *Provided*, That such advances shall be made upon such terms as the Secretary of War, and the Secretary of the Navy, respectively, shall prescribe, and they shall require adequate security for the protection of the Government for the payments as made."

79. Without the aid of this law, there were few new firms that could, by any possibility, enter the field of manufacture of ordnance; and yet new firms had to take up such work, else merchantmen, destroyers, and patrols would have been without guns. Men and ships could be provided far faster than could guns and other offensive weapons.

80. This law of Congress really saved the convoy system, made it a success, enabled destroyers and transports to be armed; without it, the Navy could never have had its clean record of transportation of men and supplies overseas.

81. The bureau, in order to insure that tests of modern ordnance could be properly made, established a proving ground at Dahlgren, Va. The bureau established also the Naval Mine Depot at Yorktown, Va., and the torpedo station at Alexandria, Va., operated the plant for production of star shells at Baldwin, Long Island, pushed the naval ordnance plant at South Charleston, W. Va., along, so that delivery of gun forgings was made during the war, established an electrical shop at Dayton, Ohio, for fire control instruments, greatly increased the naval gun factory at Washington and the naval torpedo station at Newport, and also increased the torpedo production at the works of the E. W. Bliss Co.

82. The Bureau of Ordnance originated the plan, designed, produced, and shipped materials requisite for (a) the operations of heavy naval guns aboard, mounted on mobile railway mounts, (b) the mine barrage across the North Sea, known as the north-horn barrage.

83. It also originated certain operations that were not carried out to completion because of the shortness of the war, such as (c) the 7-inch naval guns mounted on mobile mounts, which would have been, had they been shipped overseas and used on the western front, the longest range tractor-mounted batteries in existence in the world, they being capable of 23,000-yard range, and (d) long-range supergun, designed for use against fortifications and cities in a manner similar to that utilized by the Germans in their long-range bombardment of Paris, the use of which might have resulted in bringing on a second fleet engagement, and in any event would have assisted the forward push by use on German sea flank.

INCREASE IN CAPACITY FOR ORDNANCE WORK DURING THE WAR.

84. For the information of the committee, should it be desired, the following information showing actual capacities for ordnance work now and the additions made in war, which it is requested by the bureau be not made public, is appended:

85. *Supergun project.*—Having spent sometime in investigation, calculations, and research, ever since the long-range-gun bombardment of Paris, the Bureau of Ordnance, on June 8, 1918, requested the Naval Gun Factory to proceed in cooperation with the officers of the bureau with calculations and design of gun capable of longest possible range; that is, one having a muzzle velocity of 4,500 foot-seconds and giving range of from 65 to 80 miles.

86. On July 17, 1918, the bureau wrote Vice Admiral Sims as follows: "It looks as though it would be possible for us to put some guns of 9-inch caliber, with a range of between 80 and 90 miles, depending somewhat on atmospheric conditions, on board ship. This being the case, do you think it advisable to rush such work in order to try a shot into Kiel, Helgoland, etc.? The firing ship could, of course, be well out of ordinary gun range and well protected from submarines by suitable destroyers. The mount of this gun is not yet developed, but does not seem to offer any particular difficulties, and, in fact, I believe we will be able to put it on a 14-inch railway mount. Any encouragement toward completing such weapon of warfare would be appreciated."

87. On August 13, the following cable was received from Admiral Sims:

"Acknowledge and refer to last paragraph your personal confidential letter 28737-324. The use, as suggested in your letter, of such extreme ranges, I consider, would have a decidedly detrimental effect on the morale of the enemy and at the same time a most favorable effect on the morale of the Allies, especially the civilian public. The military advantage of such a weapon would depend somewhat upon its accuracy. It might be used on the 14-inch naval railway mounts to bombard large ammunition dumps or tactical supply, thus forcing the enemy to accumulate his supplies farther to the rear of his lines than at present, which might be of considerable advantage. It is difficult to anticipate the requirements far in advance and it is probable that the necessity for such gun will be greater in the future than at present. It is recommended that utmost dispatch be used by board to proceed with development of such a gun as proposed."

88. The bureau advised Admiral Sims, under date of September 9, 1918, as follows:

"At the present time this bureau proposes to build six 9-inch Mark I guns, capable of a range of about 62½ miles. The *Oregon*, *Indiana*, and *Massachusetts* would each put on one of these guns; the other three would be placed on railway mounts. The Army General Staff prefers 14-inch guns, but say that they very much desire these guns on the flank. This would mean that mounted on board ship or on shore in Flanders they might be of some value morally. It would be quite easy to shoot into Wilhelmshaven, Emden, or Cuxhaven without the ships coming within the range of any fortress."

89. On September 19 we wrote Admiral Sims as follows:

"Gen. March requested that the three superguns that we had in process of construction be also built for use on the flank as contributing to a possible moral demoralization of the enemy at the time the big spring drive is on. We expect to mount these guns on three vessels of the *Massachusetts* class and fire at big marks, such as Wilhelmshaven, the range of the guns being about 62.5 miles as calculated, though we hope for much more. Do you believe it advisable or desirable to substitute for the vessels railroad mounts? The Army prefers the guns at sea on the flank."

90. Vice Admiral Sims was advised under date of September 28 as follows:

"The so-called supergun, i. e., 9-inch Mark I, is under construction and it is a gun 90 feet long, and the travel of the projectile along the bore is 63 feet. Its range as calculated by the best of empirical formulæ is 64 miles. The department intends to mount three of these guns on the *Massachusetts*, *Iowa*, and *Oregon*. As I find these guns can also be mounted on railroad mounts exactly similar to the present 14-inch, I intend to build a railroad mount of these designs in order that they may be used on the flank on land as suggested by Gen. March, in case you so desire."

91. The design and calculations having finally been completed, examined, and approved, the bureau, on October 2, 1918, in conjunction with the Bureau of Construction and Repair, reported that the design of the 9-inch supergun was completed, together with a mount which would permit the same to be used in turrets of the *Indiana* class, and recommended that one of these guns be mounted in the forward turrets of the *Indiana*, *Massachusetts*, and *Oregon* for use against cities on the enemy's flank and against important naval bases. All these guns would be ready early in 1919.

92. The bureau recommended that the ships be sent to the New York Navy Yard in order that changes in turrets necessary would be made in sufficient time to insure the completion of the project by June, 1919.

93. On October 1 Vice Admiral Sims advised the department as follows:

"As for the 9-inch long-range guns that you propose to build, I have discussed this matter with the Admiralty, and they do not see any use to which they could be put if mounted on ships. You state that shells could be thrown into Wilhelmshaven from a distance outside of the range of the forts. This is quite true, but it would be

a major operation to get these ships into that position through the mine fields (which extend out a hundred miles) and maintain them there. They and their supporting force would be subject to torpedo attacks by destroyers and submarines every night, not to mention airplane attacks from the neighboring airplane stations. Moreover it would be practically impossible in the present state of the art to maintain airplanes sufficiently near the target to send back the spots. You may be sure all this has been looked into very carefully and the authorities do not see much chance of molesting ports like Wilhelmshaven, etc., until they have completed the construction of a number of the great planes that can carry bombs that distance and get back again."

94. Nevertheless Great Britain went ahead on these lines and only in April, 1920, have firing tests with such a gun been carried out, if recent information considered to be authentic can be believed. This statement is based on what is believed to be authoritative and satisfactory evidence although it, of course, can not be confirmed officially.

95. On October 21 the bureau wrote Admiral Sims as follows: "The comments made on the 9-inch long range guns were very interesting and was the point of view that I wanted to obtain. I realized that to use the guns it would be necessary to undertake a major operation with the fleet, and had hoped that this was desirable, as it might bring out a part of the German Fleet, and thus bring on an engagement, whereby the German Fleet would lose sufficient units to more than pay for the expense and time in getting up the proposition. In view of your comment, and my inference from it that the Admiralty would not care to undertake such an operation, I shall put the matter before the Chief of Naval Operations before undertaking to mount these guns upon the battleships of the second line. However, the new railroad mounts for the 14"/50 guns we have constructed can take this 9-inch Mark I gun, in case the Army desire to use them on shore. Unless they do care to do so, I will not attempt to complete them."

96. *Mines.*—The following was the situation relative to mines in the Navy on December 31, 1916.

	On hand.	Under construction.
Mark I mines.....	550
Mark II mines.....	312
Mark III mines.....	1,090
Mark IV mines.....	1,280	6,000
Mark I drifting mines.....	600	3,000

On April 7, 1917, the following material was on hand: Mark I mines, 550; Mark II mines, 312; Mark III mines, 1,090; Mark IV mines, 1,280; Mark I drifting mines, 600.

There were 2,000 Mark IV mines practically completed. In addition, there were under construction 10,000 Mark IV mines and 5,400 floating mines.

97. The mine and net situation in the bureau was probably the most difficult, to bring into a state of efficiency, of any of the work with which the bureau is charged. In the latter part of December the only officer attached to the bureau, who had been doing work with mines, had been detached, so that January, 1917, found the bureau with no mine section and absolutely no personnel with which to work and handle mines or nets. This was the situation confronting the new bureau chief, who, at once, made urgent representations to the Secretary, with the result that early in February he secured assignment to the bureau, in charge of the mine and net section of that bureau, which section he organized and placed into being—Commander S. P. Fullinwider, United States Navy, retired.

98. The mines that the Navy had under manufacture all possessed a firing device which was most unsatisfactory; in fact, it had been reported on adversely by our mine force, and word came from abroad that similar mines were of practically no value. One of the first steps necessary, then, was to so modify this mine-firing mechanism as to make it function under conditions met with along the coast of the United States, so that it would be suitable for any defensive mining that would be necessary. This task was handled satisfactorily and the mines on hand at the end of 1916 and those made later, on the contracts then existing, were made operative and efficient.

99. To summarize the mine situation, it was somewhat as follows: In the beginning of 1917, the situation in regard to submarine mines was most unsatisfactory. The only officer on duty with the bureau who was charged with mines had been detached in late December, 1916. The Elia type of firing device was proving unsat-

isfactory for waters where strong currents existed. Floating mines were being prepared at Newport, and the "depth mine," later known as depth charge, was being put into production, this, however, being only the 50-pound charge, then considered satisfactory in size. The prewar program called for but 14,000 contact mines, of which 3,232 were on hand. Two thousand due for completion on February 15, 1917, were under construction at Norfolk, and an additional order was placed for 10,000 at the same place, its capacity being about 500 mines per week at maximum, although the rate being attained at that time was but 140.

100. In connection with the development of the northern barrage project, which was one of the results of the study of offensive mining undertaken in the very earliest days of the war by the bureau, there was developed at St. Julien's Creek a mine-loading plant. In preparation for the barrage it was necessary to create a mine-loading plant capable of receiving, loading, and shipping 1,000 cases per day. The design for a plant of this nature was made by the Bureaus of Ordnance and Yards and Docks. The plant was located at St. Julien's Creek, Va., near the naval ammunition depot. The ground was broken for this plant on October 25, 1917, and, due to bad weather which set in early in November and continued with unprecedented severity until spring, construction work was delayed so that the plant was not ready for operation until March, 1918.

101. This plant, with its accompanying barracks for the housing of its operatives, covers an area approximately 3,000 by 800 feet, including the wharf, and consists of 22 buildings, including a mine case storage building, capable of storing 5,000 empty cases; a melting plant for the melting and pouring of T. N. T. for 1,000 mines per day; a cooling building where loaded mines are permitted to cool preparatory to shipment; a T. N. T. ready storage building with a capacity of about 4,000,000 pounds; a heating plant; and a wharf. This plant was equipped with conveyors and all labor-saving facilities. The rated daily capacity of 1,000 was exceeded by 50 per cent on one occasion. The plant handled a total of over 73,000 mines, which involved the melting and handling of over 22,000,000 pounds of T. N. T. without an accident.

102. As an indication that we entered whole-heartedly into all war projects, it is pertinent to note here that the actual proved mine capacity of this one depot was greater than the entire capacity that ever existed in Great Britain for mine production.

103. The bureau not content with planning the North Sea mine field went on and planned mine fields in the Adriatic and Aegean Seas. These projects were later taken up, considered, favorably reported on and adopted by the allied mine force in conferences held in foreign waters with responsible officers of the mine forces of the Allies. Anticipating the call for new mines that would be capable of use in water deeper even than that encountered in laying the Northern Barrage, and to provide for additional mines necessary for the Adriatic and Aegean projects, and at the same time making sufficient replacements for the northern barrage, the bureau went ahead and established the naval mine depot at Yorktown, Va. This was a comprehensive scheme, and that mine depot will form a most essential part of the Navy's activities in future years.

104. It is recalled that Rear Admiral A. P. Niblack, United States Navy, in statement before the committee on April 12, 1920, stated that—

"Before we entered the war and up to the time the convoy system got in working order the allied losses in merchant tonnage were as follows:

Year.	Ships.	Tonnage.
1914.....	67	86,665
1915.....	685	1,245,054
1916.....	1,310	2,290,437
1917.....	2,377	4,637,713
	4,434	8,259,869

"At the outbreak of war, in August, 1914, Germany had only 28 submarines, but she built 340 additional ones during the war. As there were about 200 of these submarines put out of action during the war it transpires that there were 168 submarines available for service at the time the armistice was signed. The average stay at sea of a submarine was about 27 days for the U-boats and 20 days, or less, for smaller types, of which one-third of its time was spent in going, one-third in operating, and one-third in returning to its base, and the trip generally resulted in the sinking of from 6,000 to 10,000 tons of shipping. It is estimated that each enemy submarine averaged about 40,000 tons of shipping sunk before it itself succumbed to attack. The sinking of sub-

marines was, however, not attributable to any one method employed against them, but was the result in pretty equal proportions of the various means employed against them."

105. As the total expenses involved everywhere in the mine barrage was \$79,476,534.32, it will be seen from the above that, estimating the value of merchant tonnage at \$240 per ton, which is slightly under what it was costing the United States to produce this tonnage, Rear Admiral Niblack's testimony of a submarine's value in shipping would be \$9,600,000; the cost of the northern barrage then equaled 8.32 submarines. As will be stated later, the lowest authoritative number of submarines that can be accredited to the northern barrage was 17. Therefore, the barrage was certainly well worth while and did an enormous amount of good. It is well to note again that the British Admiralty estimated officially that 23 submarines were lost in this barrage.

106. In any event it shows that the barrage which existed for only 6 per cent of the period of the war caused a loss of 8½ per cent of the total number of submarines lost during the World War.

107. In view of the fact that the testimony of Rear Admiral W. S. Sims, before the Senate committee has discussed the mine barrage in some detail, a running narrative of the conception and construction of this barrage is inserted here, after which the various statements made by Rear Admiral Sims are taken up, one by one, and discussed from the viewpoint of the records and knowledge available on this side of the sea.

THE NORTHERN BARRAGE INITIATION AND ACCOMPLISHMENTS.

The general impression gained from Rear Admiral Sims's testimony on March 16, 1920, before the subcommittee of the Senate investigating his charges against the Navy is that the mine barrage was proposed by the British Admiralty, and further that it was really not such a great success after all—did not materially affect the war.

Such impressions I consider do the Navy a great injustice and are contrary to the fact.

The Bureau of Ordnance submitted on April 15, 1917, a memorandum which dwelt upon two principal propositions: First, the protection of merchant vessels by means of cellular constructions and "blisters"; and second, antisubmarine barrages inclosing the North Sea and the Adriatic. Obviously, it was impossible to consider seriously any proposition to close German harbors as long as the enemy had complete control of his own waters. The next best thing to "closing the holes" was, of course, to close the North Sea by means of a barrage restricting the operations of enemy submarines to the North Sea and preventing their getting into the Atlantic and interfering with the lines of communication between the United States and Great Britain and France. The proponents of this plan freely admitted that such a barrage probably could not be made completely effective, but insisted that even if it were only partially effective it would win the war.

The consensus of opinion, however, was that the barrage should extend from the east coast of Scotland to the Norwegian coast. This, together with a short barrage across the Dover Straits, would shut off access to the Atlantic, or at least made the continued operations of enemy submarines exceedingly hazardous and unprofitable.

On April 17, 1917, the department cabled to Admiral (then Rear Admiral) W. S. Sims, in command of United States naval forces in European waters, directing him to report on the practicability of blockading the German coast efficiently in order to make the ingress and egress of submarines practically impossible. He in answer stated that this, of course, had been the object of repeated attempts by the

British Navy with all possible means and found unfeasible. Failure to shut in the submarines by a close blockade, using mines, nets, and patrols in the "Bight" and along the Flanders coast, focused attention of the department upon plans for the alternative of restricting the enemy to the North Sea by closing to him the exits through the Channel and the northern end between Scotland and Norway, as proposed by the Bureau of Ordnance. These are outlined in a memorandum of the Office of Operations dated May 9, 1917, which was to be submitted for the advice and comment of the British Admiralty with its valuable antisubmarine experience. The Navy Department noted that in working up any plan the whole field of operations was to be considered primarily with a view to attacking the submarine under water as well as on the surface. It stated that the entrances to the North Sea, while very broad and presenting immense difficulties, came within the bounds of possibility of control.

Estimating the cost of gaining this control and confining enemy submarines within the North Sea to be \$200,000,000, or perhaps twice that sum, there was no doubt that the United States would devote whatever amount it was worth if the purpose was to be accomplished. This was proposed to be done by establishing a barrage of nets, anchored mines, and floating mines to operate from 35 feet to 200 feet below the surface, which, while safe for surface craft, would bar a submerged submarine, while patrols could deal with those running on the surface.

Admiral Sims's reply to the department's query of April 17 was as follows:

To absolutely blockade the German and Belgian coast against the entrance and departure of submarines has been found quite unfeasible. Attempts have been made with all possible means to stop egress and to prevent nets and mines being dragged out. Many nets and mine fields have been and continue to be laid—destroyers, submarines, and other vessels have been used. Of course, for craft operating so near enemy bases, the danger is great and the result has been that several have been mined and torpedoed. Even to keep up an effective patrol against submarines and raiders between Norway and Scotland has been found quite unfeasible; far too many ships were attacked. On lines between Iceland and Scotland and between Scotland and Greenland ice floes as well as enemy craft must be guarded against on lines where patrol is now kept up. It is necessary to move lines after each enemy contact in order to maintain them and to prevent torpedoing, as there are no available ships to protect the cruisers from attack by submarines.

The destroyer has shown itself to be to a great degree the most efficacious enemy of the submarine attacking commerce. All possible means are taken by the enemy to force their being assigned to other duty, even to sinking ships on hospital service. With the exception of the minimum number required by the Grand Fleet, for carrying troops and their supplies, all destroyers are now so used. These vessels are being constructed as expeditiously as possible, but their number is quite insufficient to meet the existing submarine crisis, particularly as it affects merchantmen.

Commenting on this, the Admiralty, who had apparently but quite erroneously considered the United States proposals to particularly advocate the extensive use of nets, replied on May 13:

From all experience Admiralty considers project of attempting to close exit to North Sea * * * by method suggested to be quite unpracticable. Project has previously been considered and abandoned. The difficulty will be appreciated when total distance, depths, material and patrols required, and distance from base of operations are considered.

Admiral Sims, in his report to the department on May 14, 1917, said:

Bitter and extensive experience has forced the abandonment of any serious attempt at blockading such passages.

The officers of the Bureau of Ordnance continued to agitate the project enthusiastically and on July 18, 1917, the bureau addressed a letter to the Chief of Naval Operations announcing the development of a new type of mine-firing gear which would be suitable for mines for a northern barrage.

On July 30, 1917, the bureau addressed a second communication to the Chief of Naval Operations, submitting more complete information regarding the new mine and again proposing an American-British joint offensive operation in the form of a northern barrage.

On August 15, 1917, Admiral Mayo, commander in chief Atlantic Fleet, who was about to proceed to England accompanied by certain members of his staff, conferred with the chief of bureau and officers of the mine section regarding the new mine and its value for the proposed northern barrage. This discussion covered not only the material questions but also matters of strategy and tactics involved in such an undertaking. The bureau furnished Admiral Mayo for his information and for use in discussing the matter with the British naval authorities a memorandum embodying the ideas of the Bureau of Ordnance concerning the adaptability of the Mark VI mine for a barrage.

This memorandum gave in complete detail the barrage which was accepted later by the Admiralty. It is worthy of note that we advocated a complete sealing of the North Sea by laying the mines from Aberdeen to Ekersund, the Dover Straits to be closed by the British. The British claim to have originated the plan for the northern barrage is based on a paper submitted toward the end of August, 1917, by Commander Alan M. Yeats-Brown, D. S. O., R. N., entitled "Anti-submarine mining proposals." It also appears from a British history of the northern barrage that Commander Yeats-Brown made various proposals on the same subject during the preceding two months, first about July 1, 1917. The British had not then nor never did have a suitable mine for such a barrage. Our proposal was really put in writing under date of April 15, and the bureau was actually testing the type of mine it finally adopted two months before said Commander Yeats-Brown knew anything of or seriously considered such a barrage.

The northern barrage project was taken up at an allied naval conference, at London, September 4-5, 1917, attended by Admiral H. T. Mayo, United States Navy, where, as reported by him on September 8—

The British Admiralty put forward as an alternative to a close offensive in German waters the suggestion that the activity of enemy submarines might be restricted by the laying of an effective mine field or mine net barrage.

The mine net barrage was considered impracticable and—

As to the proposal to put down a mine barrage in the northern part of the North Sea, while it could be guarded against enemy sweepers, certain difficulties exist, such as lack of freedom of movement of the Grand Fleet, so that a very promising degree of success should be indicated before such an undertaking was begun.

Further—

The conference, after discussion, agreed that the distant mine barrage could not very well be undertaken until an adequate supply of mines of satisfactory type was assured.

Our mine record in the World War stands the scrutiny of time. In the short period devoted to mine work we averaged 12,805 mines per month. The greatest British output reached was 10,000 mines per month. In our five months of laying mines, though 3,000 miles and more from our base of supply, we planted one quarter as many as did the British during the entire period they were at war.

The results of the allied naval conference at London September 4-5, 1917, may be summed up as indicating a favorable attitude in principle toward the northern barrage project—leavened with doubt of its practicability. At the outbreak of war in 1914 the British had practically no mines, and for want of a better one adopted the Vickers-Elia type, which soon proved unreliable and ineffective. This was superseded by one of British Admiralty design, essentially similar to the Russian and German horn mines, but with a distinctly British sinker (anchor). This British horn mine, while perhaps an improvement on the Vickers-Elia, was not entirely satisfactory, being comparatively dangerous to handle, too susceptible to countermining, unreliable in automatic depth taking, and not of a type lending itself to rapid and economical manufacture.

For some reason British officials apparently were skeptical of the ability of the United States to produce quickly a more satisfactory type. This attitude first became apparent to the Bureau of Ordnance on June 2, 1917, when Admiral Sims, in a dispatch to the department reported:

The British Admiralty have concentrated upon the construction of mines to such extent that they now anticipate that by August the output will reach 10,000 a month. They consider it unwise from their previous experience with mines similar to those which we now have on hand to attempt to utilize our present available supply. They now consider * * * as our output of a different type mine would not be available in sufficient time that we can more profitably concentrate on other work.

On October 20, 1917, on the recommendation of the General Board, the Navy Department cabled Admiral Sims substantially as follows:

The department requests to be informed whether the plan for the placing of a mine barrage across the North Sea on the Aberdeen-Ekersund line has the approval of the Admiralty. It is believed that the great experience of the British naval forces in North Sea operations and their experience in naval mining during the present war puts them in the best position to decide whether the proposed scheme is practicable in construction and maintenance, and whether in the opinion of the Admiralty it is the best scheme in sight for limiting the operations of enemy submarines, provided that the Straits of Dover can be efficiently closed to the passage of submarines which if possible, in the opinion of the department, should be done at the earliest possible date.

The British proposal was our proposal modified—in some details, it is true—but less effective, the line being changed from Aberdeen-Ekersund to Orkneys-Norway, thus leaving a bad leak at Pentland Firth.

The foregoing indicates the desire of our Navy, from the very beginning of the war, to add the barrage to the existing submarine offensive measures.

The following reply in substance was received on October 23 from the Admiralty:

Admiralty's cable of 17th indicates the assistance desired from the United States of America. This scheme is considered by the Admiralty to be the best to be carried out at a distance from the bases of the enemy. The Admiralty are working on a supplemental scheme for operation close inshore, but any such inshore operation has

the defect that a passage through for submarine can eventually be cleared by the enemy.

No scheme yet tried has been effective in closing the Dover Straits to submarines, but measures are being constantly improved and they are at the least always a considerable deterrent. Mining operations on an extensive scale against submarines in the Straits of Dover commence in November. Owing to the lack of effective antisubmarine mine this has hitherto been delayed.

The report of the General Board was approved by the Secretary of the Navy October 29, 1917, and on the following day the northern barrage project was favorably acted upon by the President at a Cabinet meeting. This formal approval was anticipated, since the Secretary and the President had been in close touch with the project from its inception in April, 1917, and had been giving support and approval to the plans of the Bureau of Ordnance.

So much to show who were the initiators and boosters of the plan. It was our Navy, especially the Bureau of Ordnance.

It must have been considered a plan to offer success, as the British advertised it May 4, 1918, and Admiral Jellicoe claimed a large share in it, stating that not until large supplies of mines became available could really effective results against submarines by mining be achieved. He made the prophecy, having in mind the American barrage, that the submarine menace would be met by August. Surely the originating of an undertaking not worth while would not have been claimed by so many notable officials.

It has been established that six submarines were lost in the barrage and three more so badly damaged that they never again put to sea. However, from other evidence, the British Admiralty officially credit the barrage with 14 additional, or a total of 23. Two hundred German U-boats were destroyed in the war, or 50 more than the Allies could account for. To err on the conservative side, we claim but 8 out of the 14, credited the barrage by the British Admiralty, or a total of 17. This is also the figure arrived at by Capt. R. R. Belknap, commander mine squadron 1.

What does this figure show? Eight and one-half per cent of the total number of submarines lost during the war were brought into the list of missing by the barrage, which existed for only 6 per cent of the period of the war.

Such a result more than justified the effort and time and funds expended.

But in addition we see that it aided the successful conclusion of the war most materially by holding German battle cruisers in port and affecting the morale of the German Navy.

It was to be expected that the German battle cruisers would raid our transports coming across the Atlantic, and that such raids would be made with the probability of sinking many transports in the convoys. By closing the North Sea with this mine barrage it becomes impossible for German battle cruisers, even though commanded by sea fighters of the first quality, to leave the North Sea in order to make such attack.

The morale of the whole submarine force was affected by the presence of this North Sea barrage, and it was one of the contributory cause, if not the main cause, of the naval mutiny that occurred in Germany in the early fall. German submarine commanders continually referred to the presence of this barrage, stating that their greatest fear was caused by mines. The morale of the submarine

force was undermined by the fact of this danger, impossible to avoid, stretching across the North Sea, both on the water and underneath the water, so that the sailors and officers had a wholesome dread of the unseen danger lurking in the darkness of the rough waters of the North Sea.

After our mine fields became known, we learn that captured German commanders stated that the mine had replaced the depth charge in their estimation as being the most dreaded of the weapons in use against the U-boat. Some of these vessels actually tried to reach the high seas and return therefrom through the hazardous route of Pentland Firth.

The summary of activities of United States naval forces in European waters, issued by Admiral Sims, says further:

There is no doubt that this barrage had a considerable moral effect on the German naval crews, for it is known that several submarines hesitated some time before crossing. Also, reports from German sources are that the barrage caused no small amount of panic in some of the submarine flotillas.

It is also probable that the barrage played a part in preventing raids on allied commerce by fast enemy cruisers.

Our barrage was carried out without interfering in any way with other operations against the submarines. The barrage was the greatest constructive naval offensive of the World War—conceived immediately upon our entrance into the war, pressed upon the Allies until they accepted it, and mainly laid by the American Navy. History will give it first place as the outstanding new and effective naval weapon which this war produced. Its work stands as sufficient testimony to its worth.

TESTIMONY IN REGARD TO THE NORTHERN BARRAGE, GIVEN BY REAR ADMIRAL W. S. SIMS, UNITED STATES NAVY, BEFORE THE SENATE SUBCOMMITTEE ON NAVAL AFFAIRS, TUESDAY, MARCH 16, 1920.

A study of the testimony leads to the conclusion that, consciously or not, it was the intention of Rear Admiral Sims to prove the following propositions, all of which are believed to be fallacious:

(a) That all the antisubmarine measures proposed by the Navy Department soon after the entry of the United States into the World War were "impracticable."

(b) That no project for an antisubmarine barrage across the North Sea, of mines, nets, or both, should, at that time, have been given consideration.

(c) That a barrage was proposed as the only operation of the United States Navy.

(d) That, at a later date, September 4, 1917, the British Admiralty initiated a barrage plan radically different from the plan proposed previous to that date by the Navy Department.

(e) That the Navy Department delayed, without reason, its adoption of the British barrage plan.

(f) That after adoption the plan for a barrage of mines alone, as a joint operation, received full support from Rear Admiral Sims and from the Admiralty.

An effort will be made below to show at what points in the testimony each of these propositions is supported. Comment will be made where it appears that false impressions have been or are

likely to be created by the wording or arrangement of the testimony. The force of real arguments presented in favor of the propositions will be discussed, contradictions noted, and additional evidence not included in the testimony will be referred to in rare instances where it appears possible that facts known to Rear Admiral Sims have been ignored. Nothing will be given in comment upon parts of the testimony that are merely irrelevant, or upon parts that appear either to be true, or, if fallacious, to be incapable of disproof by evidence available to the Bureau of Ordnance. Most, but not all, of the statements which are objected to have a basis in fact, but, by their manner of presentation, give impressions wide of the truth.

It is pertinent here to quote the remarks of Rear Admiral Mayo made before the committee on March 30, 1920, in reference to this matter. They are:

Referring to the discussion of the northern mine barrage—the discussion of the northern mine barrage is misleading. In 1917 I took over a memorandum regarding a mine barrage, which included the details of the mine. The British Admiralty discussed this question with myself and staff and proposed modifications which were later accepted by our department. I incorporated this statement in order that there can be no doubt on the subject. Furthermore, I do not concur in the statement that the barrage was a subsidiary measure, but I will not attempt to go into the details because the committee will presumably call officers who are more familiar with the details than I am.

Proposition (a) is that all the antisubmarine measures proposed by the Navy Department soon after the entry of the United States into the World War, were impracticable. Rear Admiral Sims states:

- 187:15-16. 3. Mine barriers of net and mines of standard types.
4. Mine barrier of mines of new type.

Separation of mine barriers into two classes, standard and new, implies that the corresponding plans were distinct and consecutive in the order given. As a matter of fact the hope of using standard mines, Vickers-Elia type being understood by this term, had been definitely abandoned by the Bureau of Ordnance prior to the issuance, April 15, 1917, of a comprehensive memorandum on anti-submarine warfare, prepared, at the instance of the chief of bureau, by Commander S. P. Fullinwider, United States Navy (retired), then head of the mine and net section of the bureau. The following quotations from this memorandum are particularly interesting in this connection:

28. All measures for sealing ports or channels present the difficulty that the Germans have so extensively mined their waters and have such supervision and control thereof as to render such measures almost, if not, impracticable. It is possible, however, to establish mine barriers in zones at a distance from the German coasts, practically sealing up the North Sea. * * *

33. The northern barriers would extend from the mid-eastern coast of Scotland to the Norwegian coast, a distance of about 250 miles. * * *

36. Assuming that a special form of mine is used. * * *

41. * * * If an immediate decision should be made, the proposed barrier scheme could not be put into effect inside six months.

In his testimony Rear Admiral Sims states:

188:17-19. * * * there must have been compelling reasons, tactical or otherwise, that had prevented its adoption by the Allies long before our entry into the war.

189: 25-35, 38-41, 46-48. The fact that all such methods (nets, mines, obstructions, etc.) inherently involve the added necessity of continuous protection and maintenance by our own naval forces, is seldom understood and appreciated. I finally convinced the prime minister of the fallacy of such propositions by describing the

situation into which we would be led, namely, that in order to maintain our obstructions we would have to match the forces the enemy brought against them, until finally the majority, if not all, of our forces would be forced into dangerous areas, where they would be subject to continual torpedo and other attack; in fact, in a position most favorable to the enemy.

The heaviest anchors obtainable have been used for nets, mines, and obstructions, only to have the arduous work of weeks swept away in a few hours of heavy weather. Moorings will not hold. They chafe through.

Submarines have gone under mine fields and have succeeded in unknown ways in evading and cutting through nets and obstructions.

192: 19-22. Bitter and extensive experience has forced the abandonment of any serious attempt at blockading such passages as Scotland to Norway, Scotland to Shetlands, Skaggerback.

194: 21-29, 50-60. 26. As for protecting such a long line, or any line of considerable length, it is, of course, physically impossible to do so effectively, and this for the fundamental reason the defense is stretched out in a long and locally weak line, while the enemy can concentrate an attack at any point of it, destroy the patrol vessels, and drag out some sections of the mines or net, thus permitting the passage of any number of submarines.

27. This can be done in as many places as desired and as often as may be necessary, whether the barrier is nets or mines.

I can not too strongly emphasize the fact that during nearly three years of actual warfare this whole question has been the most serious subject of consideration by the British Admiralty, and that many schemes of the nature of those in question have been thoroughly discussed, and those considered practicable—those which do not violate a fundamental principle—have been, or are now being, tried and extended; but the point is that no barrier can be completely effective, and, unfortunately, a barrier or system of barriers, such as mines, etc., needs only to be slightly ineffective to permit continuous passage without much loss of submarines.

199: 7-12. Their experience in developing new designs and arranging and conducting manufacture rapidly under pressure of actual war conditions has been very disheartening, and they are therefore considerably concerned over the prospect of our introducing new designs with which the personnel here will not be wholly familiar.

All these statements are of the same general type, showing disbelief in any mine barrage. The fact that something has failed is taken as an argument against trying again in a new way designed to avoid the causes of failure. Comment is superfluous.

Writing of the British experience, Rear Admiral Sims says:

192: 5-9. According to their experience, all barrages, whether of mines or nets, or both, are not an absolute solution, for the following fundamental reason: Nets do not stop submarines. Mine barriers can not be wholly effective, unless they could be maintained by patrol at all points.

A particularly pernicious type of argument is illustrated by these instances, to the general effect that there is no difference between partial success and complete failure. A little consideration will show how weak such an argument is when Rear Admiral Sims urges, almost in the same breath, the continuance on a greater and greater scale of measures, such as the use of destroyers and other craft, whose failure to wholly suppress submarines is well known. (See testimony, p. 188, lines 6-8.)

Rear Admiral Sims goes on to say:

188:45-48. Even to keep up an effective patrol against submarines and raiders between Norway and Scotland has been found quite unfeasible; far too many ships were attacked.

It is implied by use of the word "even" that the planting of a mine barrage would make this problem harder. The contrary is the case.

Again he says, speaking of the Navy Department's proposal:

188:48-49. On lines between Iceland and Scotland and between Scotland and Greenland. * * *

The implication is that the Navy Department proposed barrages between Iceland and Scotland or between Greenland and Scotland. This was never done.

Rear Admiral Sims also says:

192:14-16. A barrage that can be thus broken at will by concentrated attack is ineffective.

The argument of Rear Admiral Sims that surface craft can easily sweep passages for submarines loses force as the barrage is placed farther from the enemy's bases and nearer to our own. Compare paragraph 28 of the Bureau of Ordnance memorandum of April 15, 1917:

All measures for sealing ports or channels present the difficulty that the Germans have so extensively mined their waters and have such supervision and control thereof as to render such measures almost, if not, impracticable. It is possible, however, to establish mine barriers in zones at a distance from the German coasts, practically sealing up the North Sea. * * *

Rear Admiral Sims seems to find no good reason for the barrage, for he says:

192:27-29. Enemy submarines can always find passages around and through, principally close in shore, and through island passages and gaps dragged in mine fields.

The longer the barrage and the better its ends are located with respect to smooth coast lines the less this argument applied. What it does show is that the patrol need not be spread out uniformly, but can be concentrated at weak spots. The argument applies more accurately to the barrage as modified by the British Admiralty than to that first proposed by the Bureau of Ordnance, since the British proposed terminating the barrage at the western end of the Orkneys, where numerous island passages required special patrolling.

Your committee should bear in mind the various and strongly expressed reasons why Rear Admiral Sims opposed the barrage from the time it was proposed, in April, 1917. He never in any letter or cable based his opposition on the character of the mines. His reasons, as given during 1917, were not because of the type of mine. His reasons as given above are practically that the British had tried out everything possible, and all methods of closing the North Sea had failed and all measures proposed by the American Navy were impracticable. In the hearing before your committee, page 193, he makes it appear that his opposition was wholly to the type of mines then known to him, for he says:

193: 4-11. It should be noted, at this point, that the scheme here proposed, although similar in character, and designed to be carried out in the same area as the northern mine barrage which will be discussed later, was to in sense the same plan later carried into effect in laying that barrage. The thing which made possible the northern barrage was the use of a certain type of mine known as the antenna mine, because of its technical features which had not been invented at the time this dispatch was sent to the department.

Much of the reasoning given above in regard to Rear Admiral Sims's testimony, quoted from page 187, 15-16, applies here as well.

In addition, it should be made clear that the new type of mine was designed to fit the barrage plan, and not the barrage plan to fit a new type of mine. It has been proven in evidence taken to support a patent claim that the device embodying the principle later utilized in the mine was not, as offered by the inventor, suitable either for an antisubmarine barrage or for any other naval use. The idea of designing a mine to utilize the unique features of the device was suggested by the existing need for an antisubmarine barrage mine.

Rear Admiral Sims further advanced the great extent of the project as an argument against it in the words:

192: 32-35. Mine area much too extensive for all to be patrolled; hence no definite knowledge of the number of submarines destroyed or damaged by mines.

The absence of "definite knowledge of the number of submarines destroyed or damaged by mines" is no argument at all against attempting such destruction and damage.

Again, in his testimony, Rear Admiral Sims says:

202: 30-33, 33-34. As I have clearly pointed out, however, the plan of the mine barrage as finally carried out, as a supplementary measure against submarines, was an entirely different matter from the plans proposed by the department in April and May, 1917.

The statement made here merely proves the inability of Rear Admiral Sims to recognize continuity in the development by the Navy Department of a successful barrage plan.

He also says:

These implied a complete neglect of the time element.

So far was the Bureau of Ordnance from neglecting the time element that the time estimate made in the memorandum of April 15, 1917, and quoted above in connection with 187, 15-16, proved in the sequel to have been approximately correct. The bureau estimated six months, and its work was completed in that time.

Rear Admiral Sims has told you that no project for an antisubmarine barrage across the North Sea, whether of mines, nets, or both, should have been given consideration during the spring of 1917.

He says:

188: 20-27. I found gradually in the early months of my mission abroad that the department was insistent upon development of some such solar-plexus blow, which should immediately defeat the submarine. Personal letters from officers in the department indicated clearly to me that, in their failure to realize the desperately critical nature of the situation, they were allowing themselves to be drawn into fascinating speculation in the effort to devise some new and radical offensive plan.

The statement that officers in the Navy Department failed to realize the desperately critical nature of the situation appears directed against all who were making an "effort to devise some such new and radical offensive plan." The following quotations from Commander Fullinwider's memorandum of April 15, 1917, will be sufficient answer to this charge as far as the proponents of the mine barrage are concerned:

* * * Germany will win the war if she can continue the rapid diminution of merchant shipping. The only hope of the Allies (including America) lies in finding means to curb the effectiveness of the submarine and replacing lost ships, and any further delay will be fatal.

The situation was clearly grasped, and it was seen by the Bureau of Ordnance as an obvious duty to study the possible value of new

weapons while maintaining peak production of all standard types required. "Fascinating speculation" is not a fair term for such duty.

Rear Admiral Sims had but one idea in fighting submarines, and that was hunting the submarines after they had been permitted to get out. The Navy Department wished to keep the hornets in their nests. Rear Admiral Sims then states his one-idea policy:

189: 10-14. In the absence of adequate patrol craft, particularly destroyers, and until the enemy submarine morale is broken, there is but one sure method of meeting the submarine issue, upon which there is also complete unanimity—increased number of merchant bottoms, preferably small.

It is assumed again that effort, except on "one sure method," is purely wasted. His mind seems closed to any plan looking to an effective barrage that would shut in the submarines. He welcomes no such suggestions, for he says:

191: 19-26. Personal letters which I received from officers in the department at this time contained practically nothing else than long discussions of various projects which might be carried out to accomplish that end, all of these requiring a tremendous amount of material, and a length of time, which necessarily reduced them to subsidiary operations to be carried when time and material might be available, if they were considered at all feasible, rather than as the main operation which the United States Navy should undertake.

Again Rear Admiral Sims says:

192: 38-41. Defensive measures on our own coast, or in any other locality, and in act, all defensive considerations, should be subordinated to the offensive against the submarines where they are operating.

The statement is very misleading, implying as it does that the barrage plan was defensive and, as such, rightly secondary. As a matter of fact, the plan was offensive, the barrage being proposed between the enemy submarine bases and their chief theater of operations.

Again and again Rear Admiral Sims emphasizes that the British Admiralty had no plan against the submarine except surface boat attacks, which they had carried on three years with small measure of success. He shared that view and discouraged, so far as he could do so by declaring other plans impracticable, the great idea of a barrage that would keep the high seas free from submarines. He insists upon the surface craft as the only weapon against them, whereas the number of net craft in Europe and America was wholly inadequate to patrol the wide expanse in which the submarines moved. Here is his argument, iterated and reiterated:

192: 47-54. It is the firm conviction of all British officials concerned in this problem that the most effective opposition to submarines lies in numbers of antisubmarine craft strategically disposed, with the mission of dispersing the enemy submarine efforts from the critical areas and thereby forcing them to operate over such widely separated areas that their successes and our losses will be reduced below the critical point.

This assumes, in error, that mine barrages in the right places would not disperse the enemy submarine efforts from the critical areas. Note also that most of the argument is as much a convoy system as against any other new plan.

Again he returns to his argument against the proposals to fight the submarines by means of closing up the North Sea, for in his testimony he goes on to say:

193: 21-33. Numerous propositions are made to the British Admiralty that have for their object the closing of the North Sea, or the German ports, against the ingress

or egress of submarines. These are presented by all classes of people, including Members of Parliament.

They are, generally speaking, of two classes, namely, mines or nets, or both. I have gone over this whole matter with the First Sea Lord, and those members of the Admiralty board who are specially charged with the practical details of such matters.

As may be imagined, this whole subject has been given the most earnest consideration, as it is, of course, realized that if submarines could be kept from coming out the whole problem would at once be solved.

Rear Admiral Sims also states:

194: 50-56. I can not too strongly emphasize the fact that during nearly three years of actual warfare this whole question has been the most serious subject of consideration by the British Admiralty, and that many schemes of the nature of those in question have been thoroughly discussed, and those considered practicable—those which do not violate a fundamental principle—have been or are now being tried and extended.

These passages, of course, nullify any argument against the consideration of similar proposals by the Navy Department, since such consideration by the British is here commended, and he accepted their conclusions unreservedly.

But after all his argument against the mine barrage, when the Navy Department refused to accept his view, the British view, he attributed the success of the barrage to a new type of mine, saying:

195: 16-21. With the invention in the United States of a new type of mine, however, the project was put in an entirely new light and it merited further careful consideration. The Bureau of Ordnance of our Navy Department was quick to grasp the possibility offered by the new mine and to outline a plan for its use.

It would be imagined from this statement by Rear Admiral Sims that a new mine was invented outside of the Bureau of Ordnance, and that new proposals originated thereafter, and long subsequent to May, 1917. That this was not at all true has already been made clear. In addition, note that the new electrical device was submitted to the Bureau of Ordnance on May 2, 1917, and was being considered as one possible firing element for a barrage mine at the time Rear Admiral Sims first heard of the barrage plan and opposed it.

So strenuously did he oppose the idea of the Bureau of Ordnance of a mine barrage that he even suggested that the bureau should drop the matter entirely, though it had devoted its best energies and thought to it from the beginning of the war. He even suggested that it could more "profitably concentrate on other work," a suggestion, in the light of what was achieved, which shows that Rear Admiral Sims as well as some others had hindsight instead of foresight in this great matter. He said to your committee:

196: 13-16. In view of above, and as our output of a different type of mine would not be available in sufficient time, they now consider we can more profitably concentrate on other work.

Rear Admiral Sims assumes the inability of the Bureau of Ordnance to supply material for a barrage without crippling other work. This indicates a certain degree of truth in his repeated statement that a situation 3,000 miles away can not be correctly judged. We were wiser in Washington, as events proved.

He devoted several pages to trying to show the difficulties that lay in the way of carrying out the project. The Navy Department's answer was that the only good of an obstacle is to overcome it and we did it to the pride of our Navy.

If consideration of every one of the problems had not been taken up by the Bureau of Ordnance on its own initiative and before the slightest encouragement had been received from abroad it would have been impossible to finish more than a small part of the northern barrage, to say nothing of the whole project, during the first available period. Far from being "impossible * * * to undertake any such scheme," it is clear that this is the very thing that was successfully done.

Rear Admiral Sims was adamant against any and every argument for the mine barrage, he refused to believe it practicable, threw cold water on it, quoted the British Admiralty on being opposed to it, and in the following statement indicated his belief that it was simply "a magnificent scheme" and could be "effective at some future date," evidently thinking this future date would not help to win the war:

205: 24-25. It is not enough, when a nation is at war, to prepare magnificent schemes of operation to be effective at some future date.

The fact is, that the Bureau of Ordnance, to take a concrete example, was at this time doing everything humanly possible to provide every sort of weapon required in other operations than a mine barrage, and doing it so quietly that Rear Admiral Sims, bombarded with queries as to plans whose progress was being delayed by lack of information from abroad, thought nothing was being done.

Rear Admiral Sims indicates that at a later date, September 4, 1917, the British Admiralty initiated a barrage plan radically different from the plan proposed previous to that date by the Navy Department, and giving the British Admiralty credit for what justly belongs to the American Navy said:

200: 34-38. I immediately replied in my dispatch 187 of August 22, stating that the British were sending a special officer to inspect and test the new mine, and that if it was found "suitable for operations in contemplation, further arrangements for cooperation would be made."

The context makes it clear that the "operations in contemplation" were American in origin. The low rank of the officer selected (Lieut. DeSalis, R. N.), indicated to the Bureau of Ordnance that the Admiralty at this time, two weeks before the date of its alleged initiation of the final barrage plan, held no very high opinion of any such plan.

Continuing, Rear Admiral Sims said:

200: 40-44. He (Admiral Mayo) brought with him a memorandum from the Bureau of Ordnance, with regard to the new mine, and had been instructed by the department to discuss, at the allied conference, the possibility of offensive operations based upon the employment of this new mine.

The impression conveyed is that Admiral Mayo brought to the conference of September 4 and 5 only a memorandum giving the characteristics of the new mine. This is a serious understatement and conveys a wholly wrong impression, for Admiral Mayo not only had the characteristics of the mine but the well developed plan for the barrage.

As soon as experiment had shown, early in July, which of the new types of mine under development should be chosen for the barrage, already a well developed plan, the Bureau of Ordnance, in two letters to the Chief of Naval Operations, dated July 18 and July 30, and in a memorandum for the commander in chief Atlantic

Fleet, dated August 15, gave in great detail and with a full statement of the reason for each recommendation a comprehensive plan for the northern barrage. This plan represented the result of continuous study by officers of the Bureau of Ordnance, and of frequent conferences between these officers and others concerned.

Again Rear Admiral Sims gives all the credit to the British Admiralty:

200: 45-48. In the agenda for the conference, prepared by Admiral Jellicoe, item two was that of a mine or net barrage, either in German waters or farther afield.

Note that the inclusion of the barrage among the subjects for discussion gives no clue as to its origin. Each of the members of allied conference had undoubtedly been consulted informally before this list was made out. It is the opinion of the Bureau of Ordnance that its plan, approved by the Chief of Naval Operations and in the hands of Admiral Mayo, was the reason for this inclusion of this item. In this connection a quotation from the British "History of the northern barrage from its inception to 28th July, 1918," issued by the Admiralty on August 4, 1918, is of some evidential value. After mentioning a study of antisubmarine measures made by Capt. Yeats-Brown, R. N., during July and August, the following statement is made:

The conclusions arrived at were brought up for discussion at the next allied naval conference by the First Sea Lord, who, it is believed, had previously discussed the matter with Admiral Mayo of the United States Navy.

But Rear Admiral Sims persists in giving priority to the British Admiralty and says:

200: 50-53. The British Admiralty put forward, as an alternative to a close offensive in German waters, the suggestion that the activity of enemy submarines might be restricted by the laying of an effective mine field or mine net barrage.

Note that the British conferees, apparently guided by the report of Capt. Yeats-Brown, were still talking about mine nets. Mine nets had been regarded by the Bureau of Ordnance as unpromising since before April 15, and even the experimental study of such devices had been stopped early in July.

Admiral Jellicoe's comments on the subject at this conference were not those of an active proponent. He said, quoting again from the British "History:"

I do not think we get many submarines by mines. * * * There is the alternative of laying a mine field in the North Sea, in a position where the enemy sweepers can not reach without running very considerable risk. In view of our present experience I do not think that would have much more result than our present policy; but if a mine is produced which is more effective against submarines than our own mines, the matter perhaps becomes somewhat different. * * * A great deal depends upon whether the mine is a satisfactory one. If we get a satisfactory mine it might be worth while laying a barrage when we get a sufficient number.

These are the words of one who wishes to discourage a plan without giving offense to its originators.

In the following statements Rear Admiral Sims continues to lay stress on the mine and give its perfection as a reason for the change of front, though that is not justified by the facts. He said:

201: 14-24. The description of the new mine, brought over by Admiral Mayo, gave an entirely new direction to the discussion, and before Admiral Mayo left he was provided with a plan, drawn up in a conference of allied officers, for a barrage of mines of this new type to be put across the North Sea.

On September 13 Admiral Mayo received a message from Admiral Benson, emphasizing the great possibilities of the new mine, stating that the British officers sent over to the United States to examine it had found it most satisfactory and urging that immediate action be taken. The result was a proposal by the Admiralty of a of a definite scheme for the northern mine barrage.

The statement that the plan was "drawn up in a conference of allied officers" is true only to the extent that the Navy Department's plan was discussed and modified in details. This occurred between September 5 and 15. On the latter date the Admiralty issued to Admiral Mayo a memorandum entitled "General future policy, including future mining policy," with an appendix, "Mine barrage in the North Sea." This memorandum followed very closely most of the features of the American plan, and it was regarded by the Navy Department as a "confirmation copy" of that plan. The changes in the details of this "definite scheme" were not in all cases improvements, and appear to have been dictated mainly by a lack of confidence in America's ability to carry out successfully its share of the joint operation it proposed. One change in particular was regarded by the Bureau of Ordnance as inviting certain failure. This was the proposal to leave patrolled area at the eastern end of the barrage in which only deep mines would be planted, instead of mining all the way up to the surface. The difficulty of maintaining an efficient patrol at this distance from Scotland would have been enormous, and after the British Admiralty became convinced that the supply of American mines was really forthcoming and not merely a bluff, the original Bureau of Ordnance plan of leaving only necessary "gates" close to the coast of Scotland was returned to.

Perhaps the most remarkable of all the statements giving credit to the British Admiralty which belongs to the American Navy is the following:

201: 41-45. That is to say, the mine barrage of the North Sea, the plan of which was drawn up by the British Admiralty and which had been proposed by the British Admiralty and which was taken home by Admiral Mayo, was held up for discussion to see whether the American Navy Department would agree to the laying of that barrage.

This statement that the British Admiralty originated the northern barrage is utterly false. The proof of this has been referred to just above. That Rear Admiral Sims was not always so ready to concede British claims in this connection is proved by his letter dated August 23, 1918, transmitting the British history referred to above, in which he said:

The Admiralty history does not appear to be complete from the American viewpoint.

Rear Admiral Sims in his testimony said that the Navy Department delayed without reason its adoption of the British barrage project. Here are his words:

201: 35-40. Seventh. Question of proposed mine barrage. Scotland to Norway, as presented to Navy Department, is not definitely concurred in, but careful consideration is being given to this particular subject, with a view to arrive at definite conclusion in regard to employment of the mine barrage, which measure is considered in principle to promise good results.

This paragraph, taken alone, appears to indicate delay. It conveys a wrong impression, for production of material by the American Navy was under way. The first large contract, that for 90,000 firing devices, was let on October 3, 1917, raising from 10,000 to 100,000 the total number on order.

The questions under discussion at this time between the Admiralty and the Navy Department were details as to location, patrol, and the like, where the changes introduced by the British promised to reduce the efficiency of the plan. It should be stated here that unannounced and arbitrary changes in the plan continued to be made by the British up to the very end of the project and caused extreme difficulty in the supply of suitable mines and anchors to meet demands made 3,000 miles away without much reference to material problems. The first effect of a difference of opinion in regard to a detail of the plan was usually to speed production so that either proposed type of material could be supplied without too much departure from schedule. Many changes proposed by the British Admiralty tended to restore the original plan as opposed to the complicated system of partially mined areas favored by the Grand Fleet.

Even after the British Admiralty approved of the plan for a barrage of mines alone, as a joint operation, Rear Admiral Sims said:

203: 42-44. The difficulty of cooperating with the Grand Fleet and of securing the consent of the commander of the fleet to laying mine fields with an untried electrical device in areas through which and over which the Grand Fleet necessarily might operate.

The difficulty of securing the consent of the commander of the Grand Fleet to laying any mine barrage was felt long after the project was under way.

Rear Admiral Sims was still hesitating and doubtful, even after approval of the project, for he says:

204: 27-32. It therefore was incumbent upon me to assure myself that before giving my concurrence, not only that it was a practicable project but that it promised to be reasonably effective and could be executed without serious detriment to the efficiency of the other antisubmarine measures which were already being carried out.

Although not plainly put, this appears to be an excuse for further delay due to Rear Admiral Sims, and implies that he was not yet convinced that the barrage even "promised to be reasonably effective." That Rear Admiral Sims was hesitating to decide in favor of the barrage on September 4, 1917, is shown by his statement at the allied naval conference of that date, and quoted in the British "History." He said: "It must be successful completely or it is not successful at all. Either the barrage is successful absolutely or it fails absolutely."

From this analysis of the testimony in regard to the northern mine barrage, it appears that the propositions apparently supported by Rear Admiral Sims are incorrect, and, that where a basis of fact exists which appears to support any of them, it does so only because of the method of presentation or because pertinent facts leading to a different interpretation have been omitted. The contrary propositions that the northern mine barrage was American in its origin, urgently recommended against British opposition and carried to success without delaying or hindering any other useful activity, are considered to have been abundantly proven.

RAILROAD BATTERIES.

The railroad batteries provided by the Navy Department were successful in their operations in France, as has been testified to fre-

quently, and especially in the two reports of the operation made by Gen. J. J. Pershing, United States Army. In his report dated November 20, 1918, he states:

Our large caliber guns had advanced, and were skillfully brought into position to fire upon the important lines at Montmedy, Longuyon, and Conflans. On the 6th a division of the First Corps reached a point on the Meuse opposite Sedan, 25 miles from our lines of departure. The strategical goal which was our highest hope was gained. We had cut the enemy's main line of communications, and nothing but surrender or an armistice could save his army from complete disaster.

And in his final report of September 1, 1919, to the Secretary of War, he states as follows:

The only guns of these types produced at home which reached France before the cessation of hostilities were one hundred and nine 75-mm. guns. In addition, twenty-four 8-inch howitzers from the United States reached our front and were in use when the armistice was signed. Eight 14-inch naval guns of American manufacture were set up on railroad mounts, and most of these were successfully employed on the Meuse-Argonne front under the efficient direction of Admiral Plunkett of the Navy.

GENERAL REMARKS.

The Bureau of Ordnance, it is thus seen, was working along lines well defined and laid out in instructions of the department from time to time, many of which were originated by the war plans provided the bureau in March, 1915.

The organization of the Bureau of Ordnance, during the time of peace was a workable organization and one made to operate with the least friction with view toward its operation during war. This aim was realized, in that the organization was never changed during the course of the entire war and it proved a workable and satisfactory method of handling ordnance material. It also showed that it could be enlarged without confusion to any degree desired. This organization simply linked together authority and responsibility directly and thus proved most adequate to meet all the situations that arose from time to time during the World War. It also controlled directly sufficient industrial plants to set a standard to which commercial firms entering the field of ordnance manufacture could follow, and provided the necessary skilled supervisors with which to do the work.

One reading much of the testimony before the committee can not help but feel that work of the Navy in the World War is belittled unnecessarily and that effort is being made to prove that the Navy did not enter wholeheartedly into the business of carrying on the war promptly, and that organization of the department was such as to not obtain best results. The organization of the bureau is considered to need no change and its relations with the Chief of Operations are considered to be proper and of the best, no friction whatever has arisen either during the war or peace. The directions of the Chief of Operations are always carried out wholeheartedly, and anticipated in large degree.

It is believed that the partial record of the bureau, as submitted heretofore, indicates that the bureau put every effort into getting ready for the war that could be legally done before February 3, and from February 3 to April 6, everything possible in any way that could be done was done, and it is possible to say more and go back in certain respects to midsummer of 1916, when the record made by Ordnance will stand the closest scrutiny by anyone. This record indicates no

waste of money or material, but rather that logical steps were taken with knowledge of war conditions existing and with deduced outlook into those that would arise in the future after our entry into the same.

That we, of the Navy, wasted no time in getting into the war is also testified to by extract of an article by Mr. H. M. Hyde, which appeared in the Chicago Daily Tribune under date of November 21, 1917, which is hereafter quoted merely as giving an outside opinion of the Navy Department's activities at that state of the war.

BIG ORDNANCE CONTRACTS.

To get down to cases, consider what the Navy has done and is doing in the matter of big guns and ammunition.

The Navy has so far let more than 800 ordnance contracts. That is, it has placed 800 odd contracts for big and little navy guns, for shells to shoot in them, for powder, bombs of various kinds, high explosives, and other implements of war. Some of these contracts were let long months before war was declared on Germany.

On each contract delivery at a certain specified time is called for, and a weekly report must be rendered showing exactly the progress of the work on each of hundreds of thousands—even millions—of items covered.

It is a fact—a most extraordinary and cheering fact—that out of 822 contracts there is only one on which the work is not advanced as far, if not farther, than it should be at this time.

SHOWING IS CREDITABLE.

One may take it for granted that the eager officers of the Navy who have such matters in charge allowed on all these contracts the shortest possible time. It means a great deal to say that in every case but one the job is up to or ahead of the schedule.

Such a record, one would be sure, could not have been made without careful foresight and planning. The facts are that the Navy in many of its departments began to get ready for war on a big scale a long while before anybody else woke up.

More than a year and a half ago, long before there was anything more than danger of war with Germany, the Navy started out on a big campaign. It canvassed all the machine shops and other factories which might be useful in making supplies and munitions for the fleets.

TRIES THEM OUT.

It made small trial contracts with many of them. It found out just what institutions in the United States were fitted in equipment and personnel to do work for the Navy.

Navy experts saw to it that the proper machinery was supplied and installed in proper quantities and that the proper number of machinists and other workmen were employed and trained to do the Navy work.

At the very first instant when it was legally possible—perhaps the clock was even set ahead a little—the Navy Department took advantage of the law under which it could advance money to private manufacturers for the enlargement of their plants, the advance to be paid back later out of the proceeds of the Navy contracts, and tied up a considerable number of big factories with huge orders for munitions and supplies.

CONTROL MANY FACTORIES.

To-day the Navy Department controls enough factories to fill every possible demand for guns, shells, munitions, and supplies. It has even made supplemental contracts with still other factories covering possible but still indefinite future increases.

Perhaps the greatest handicap experienced by the bureau in getting a start was the shortage of commissioned personnel available on duty in Washington. This, of course, was due to the continually recurring statements before Congress and in the papers of Washington that too many naval officers were on duty in that city. We suffered in the World War from having had insufficient officers on duty in Washington during the time of peace, and it is to be hoped that this great mistake will not be repeated in the future.

The department, especially so far as material bureaus are concerned, must have competent and sufficient number of officers on duty at all times to not only handle routine administrative affairs of the Navy but to carry on scientific research and investigation and make the Navy progress and maintain a position in the lead of all navies in the world. It is the shortage of officer personnel during the time of peace on duty at headquarters that is mainly responsible for any lack of preparedness, efficiency, or modernness of our Navy. Funds are sometimes available in sufficient amount but have various restrictions placed on their use which nullify and prevent their being applied to the best advantage. The greatest handicap that this bureau, at the present time, for example, is laboring under, is the restriction as regards employment of draftsmen and technical help in the bureau at the Navy Department. There is no restriction on the employment of draftsmen elsewhere than in the bureau, but it is manifest that in the bureau is the place where they should be employed and not outside where the knowledge that is available to the department can not be obtained by them.

In other words, the officer, the civilian technical, the design and the drafting staff should be maintained in sufficient numbers in time of peace to insure that the Navy is ready without fail in the time of stress. This condition should be established and maintained in being during peace. This material bureau requires aid along this more than any other line. Its realization will save millions when the next time comes.

PRESIDENT WILSON'S PLAIN TELEGRAM TO ADMIRAL SIMS.

From the date the United States entered the World War the President kept in close touch with all matters affecting naval policies and was keen in proposing and following up plans for new, bold and audacious methods against the submarines. He was familiar with the cablegram I sent to Admiral Sims in April, 1917, suggesting plans for shutting the submarines up in German waters, the plan proposed by the Bureau of Ordnance in April, 1917, for a barrage across the North Sea, and the earnest desire of the Navy Department to run any risk to secure the adoption of daring and effective offensive measures. The new and bold measures suggested by the Navy Department in the spring of 1917 were all pronounced "impracticable" by Admiral Sims, who reported that the British Admiralty declined cooperations because they were "unfeasible" or "impracticable," though they were finally accepted after much pressure by the Navy Department and proved the most effective offensive against the submarine.

The President believed so strongly in new and offensive measures that the attitude of Admiral Sims in opposing the really great plans proposed by the department led him to send the following plain telegram to Admiral Sims in July, 1917:

WASHINGTON, July 4, 1917.

From the beginning of the war, I have been greatly surprised at the failure of the British Admiralty to use Great Britain's great naval superiority in an effective way. In the presence of the present submarine emergency they are helpless to the point of panic.

Every plan we suggest they reject for some reason of prudence. In my view this is not a time for prudence but for boldness even at the cost of great losses.

In most of your dispatches you have quite properly advised us of the sort of aid and cooperation desired from us by the Admiralty. The trouble is that their plans and methods do not seem to us efficacious. I would be very much obliged to you if you would report to me, confidentially, of course, exactly what the Admiralty has been doing, and what they have accomplished, and, added to the report, your own comments and suggestions, based upon independent thought of the whole situation, without regard to the judgment of anyone on that side of the water.

The Admiralty was very slow to adopt the protection of convoy and it is not now, I judge, [protecting] convoys on adequate scale within the danger zone, seeming to keep small craft with the Grand Fleet. The absence of craft for convoy is even more apparent on the French coast than on the English coast and in the Channel. I do not see how the necessary military supplies and supplies of food and fuel oil are to be delivered at British ports in any other way within the next few months than under adequate convoy. There will presently not be ships or tankers enough, and our shipbuilding plans may not begin to yield important results in less than 18 months.

I believe that you will keep these instructions absolutely and entirely to yourself, and that you will give me such advice as you would give if you were handling and if you were running a navy of your own.

WOODROW WILSON.

Admiral Sims's reply was a long telegram of generalities of what the British Admiralty was doing. He told of a "combined sea and land attack to force back the German right flank and deny them the use of Zeebrugge as a provisioning base." That was the kind of bold and audacious thing the President and the department had been urging from our entrance into the war, but even then, as Admiral Sims said, it had not been "definitely decided by the war council," though the daring and successful attack on Zeebrugge came much later. It might have been a different story if it had been undertaken earlier when the Navy Department was urging some such bold plan, all of which Admiral Sims thought "impracticable" when proposed and urged by our Navy.

In his answer to the President, referring to the American Navy's plans for preventing the egress of the German submarines, which, in 1918, were successfully carried out, Admiral Sims cabled: "I have been shown studies of the proposed plans and I consider them impracticable," and evidently sought to discredit the Navy Department's plan by saying:

These same suggestions and many similar ones have been and continue to be made by people of all classes since the beginning of the war.

Instead of accepting the department's suggestions of great offensive plans, or originating some plan that promised to stop the egress of German submarines, his mind was closed as the above and many other extracts show, to every plan looking toward the great offensive which in the fall of 1918 was the most effective foe of the submarine.

Admiral Sims cabled the President that the proper policy to pursue was to adopt the suggestions he had made to the Navy Department, most of which had been decided upon and put in operation before Admiral Sims had suggested them, and Admiral Sims added that we should adopt an organization "similar in all respects to the British squadron," virtually transfer all naval authority to his headquarters in London, and that he should be given a larger staff. He was careful not to say, though he regarded the Queenstown base and surroundings as "the critical area," that as rapidly as American destroyers arrived in this critical area the British destroyers were removed to another base, though he now makes the preposterous statement that the failure to have more destroyers in that critical area (we had 34 at that time out of our total 50) occasioned the loss of 500,000 lives,

and fifteen hundred thousand or billion or trillion, or quadrillion dollars—I don't know how much, it is so absurd.

There are two remarkable and significant statements in his cable to the President, particularly significant in the light of his later letters and statements:

1. He cabled the President that the views he had expressed were "in all cases an independent opinion," and in the very next paragraph showed how "independent" his opinion was when he said—I am quoting his exact words—it was "based upon specific facts and official data which I have collected in the Admiralty and other government departments" (meaning the British). He closed the paragraph by saying: "They constitute my own conviction and hence comply with your request for an independent opinion."

2. He also cabled the President as follows, and, gentlemen, I wish you to bear in mind that this is an admiral of the American Navy telegraphing to the President of the United States, the commander of the American Navy. He cabled the President as follows [reading]:

Depend upon the fact, which I believe to be true, that regardless of any future developments we can always count upon the support of the British Navy. I have been assured this by important government officials.

This is the most remarkable of all the abundant evidence that Admiral Sims was so hypnotized by British influences that he was willing to try to lure the President of the United States into the feeling that "regardless of any future developments, we can always count upon the support of the British Navy." He not only expresses it in a childlike and bland way as his opinion, but gravely also stated that he had "been assured this by important government officials." It would be interesting indeed to know what British "government officials" assured him that "regardless of any future developments" the United States can always count upon the support of the British Navy. It seems inconceivable that any admiral could have regarded such assurance as worth paying the tolls to transmit. Every school-boy should know that no government official in a democratic government could pledge his country's navy to support another government "regardless of any future developments." It is to be hoped that if Admiral Sims has such assurance he will send a copy of the pledge in writing with the name of the "important government officials" appended thereto to be filed in the archives of "Sops for the simple."

It is, indeed, to be hoped that the navies which fought together in the World War will always be employed in cooperation to effect the world's peace, but, without a binding League of Nations, no man not hypnotized believes that the navy of one country "regardless of any future developments," will be at the service of another country. This statement, however, shows how completely and absolutely and hopelessly Admiral Sims was under the spell of influences which made him believe that the British Government could be depended upon more to take care of America rather than that America should depend on her own strong right arm. It is one thing, Mr. Chairman and gentlemen of this committee, to cooperate heartily and upon equal terms with the navy of another country. That was the Navy Department's attitude throughout the war. It is quite another thing to be absorbed in belief in the infallibility of another country and to have an obsession of its supposed superiority. That was the

attitude of Admiral Sims as evidenced by his own statements and action.

That attitude of acceptance of everything British undoubtedly accounts for his opposition to the creation of an independent American Army and his idea that the American troops sent abroad should be used as an annex to the British Army, quoting Gen. Bliss as recommending that policy. When Gen. Bliss read in the published testimony that Admiral Sims had quoted him as advocating such a policy, he wrote at once to the Secretary of War a letter in which, after quoting the testimony of Admiral Sims, Gen. Bliss said:

Not only at no time did I make any recommendations for the brigading of American troops with the British Army, but the truth is exactly the reverse.

To that attitude, too, is to be attributed his statement to Hon. C. C. Carlin, then Member of Congress from Virginia, that America did not need to build a big Navy because our country could depend upon the navy of Great Britain.

It is likewise true that the same mental attitude accounted for the statement Admiral Sims made to Congressmen Byrne and Whaley and Senator Glass when they were abroad during the war, as stated by Congressman Byrnes:

He (Admiral Sims) expressed the hope that we would not be led astray by the agitation for a merchant marine. He declared that England, because of her geographical location, must necessarily control the seas, said that we could rely upon her at all times providing a merchant marine to transport our goods to foreign markets. When I took issue with him he stated that even if we entertained the view that it would be desirable for the United States to possess a merchant marine, that it was impossible because we could not compete with Great Britain; that it would be necessary to pay subsidies, for which our people would never stand; and that it was the part of wisdom for us to develop the great West and leave the sea to Great Britain. With that government, he said, we would never have any trouble, and Great Britain could be depended upon at all times to care for our business upon the seas.

The President's plain telegram quoted above, conveying his dissatisfaction with the policy of "prudence" instead of "boldness" and his earnest belief in audacious policies, evidently caused Admiral Sims to believe that the President would recall him to America. This is made plain by the following letter which Admiral Sims wrote to Ambassador Walter H. Page:

UNITED STATES NAVAL HEADQUARTERS,
London, August 7, 1917.

MY DEAR DR. PAGE: In the first place, let me congratulate you on your "Mayflower" speech. It was highly original and just the kind of common-sense "dope" that is needed on both sides of the water.

I particularly like the idea of having some proper history books written for the small Americans and Britishers.

I remember the hard jolt Max O'Rell gave the British public by publishing extracts from their school histories to show that the poor children were taught to hate and despise the French.

I inclose you two articles by prominent naval writers on the subject of "Digging the rats out of their holes."

Now, Mr. Chairman, I would like to emphasize the following two paragraphs [continuing reading]:

In this connection I have a suggestion to make—

Now, this is an admiral of the American Navy writing to the American ambassador in London—

I have received word, practically directly from the President, that he was much displeased with my reply to his cablegram, that it did not change his opinion at all,

and that he regards me as owned by the Admiralty and so pro-British that he considered the advisability of replacing me by some other officer.

My suggestion is that you send the inclosed clippings to Mr. Lansing, with the idea that he may show them to the President.

In any case this can do no harm, and it may do some good.

I hope you are fully enjoying your vacation. Please give my kindest regards to Madam Page, and believe me,

Very sincerely, yours,

WILLIAM S. SIMS.

SIMS TOLD CONGRESSMAN CARLIN THAT ENGLAND HAD PROTECTED US ON THE SEAS, AND WE COULD ALWAYS RELY UPON HER TO DO SO.

I have furnished your committee with statements by Admiral Sims himself, addressed to the President of the United States, showing his belief that the United States could depend upon the British Navy under all circumstances.

I have furnished you with his statements in which he advocated brigading our soldiers with the British, which policy he incorrectly attributed to Gen. Bliss, and which Gen. Bliss repudiated.

You have read the statements of Senator Carter Glass and Congressmen Byrnes and Whaley, who said, as stated by Mr. Byrnes:

On October 30, with my colleagues, I saw Admiral Sims, who was then in Paris. I shall never forget that interview. The armistice had been requested by the enemy. Sims told us of the magnificent progress made by the British on the English front, and as we listened he proceeded to tell us that the armistice would have to be granted because Pershing had been unable to break through the German lines, owing to the absolute breakdown of transportation behind the American lines. With pathos in his voice he told us how unfortunate it was that this breakdown occurred at so critical a moment. In amazement we listened, and in the monologue he delivered he proceeded to tell us that while the Americans believed their Navy was working wonders, that as a matter of fact we had but 3 per cent of the antisubmarine craft in English waters; that Great Britain had brought over two-thirds of our troops and had escorted one-half of them.

In his hearing before this committee Congressman Byrnes told you:

Not satisfied with telling us how small a part we played upon the sea in time of war, he proceeded to tell us that in time of peace we should seek to play no part at all. He expressed the hope that we would not be led astray by the agitation for a merchant marine. He declared that England, because of her geographical location, must necessarily control the seas, and that we could rely upon her at all times providing a merchant marine to transport our goods to foreign markets. When I took issue with him, he stated that even if we entertained the view that it would be desirable for the United States to possess a merchant marine that it was impossible because we could not compete with Great Britain; that it would be necessary to pay subsidies, for which our people would never stand, and that it was the part of wisdom for us to develop the great West, and leave the sea to Great Britain. With that Government, he said, we would never have any trouble, and Great Britain could be depended upon at all times to care for our business upon the seas.

In addition to the statement you already have in the record, I will read you now the statement of another prominent and able Member of Congress, who visited Europe during the war, Hon. C. C. Carlin, of Virginia, who was told by Admiral Sims that—

As compared with the British Navy, and our achievements had amounted to but little during the war; that England had protected us upon the seas and we could always rely upon her to do so, and that in view of this friendship there was no necessity for us to desire a Navy which would in any way equal that of Great Britain.

The full letter of Hon. C. C. Carlin is as follows:

WASHINGTON, D. C., April 20, 1920.

HON. JOSEPHUS DANIELS,
Secretary of the Navy, Washington, D. C.

MY DEAR MR. SECRETARY: It has been in my mind some time to write you with reference to a conversation I had with Admiral Sims in London, in December, 1918. At that time I was a Member of Congress, had been reelected to the present Congress, and was traveling with my young son in Europe.

While in London I went to the American Embassy to inquire as to Admiral Sims's headquarters, as I wished to call and pay my respects. Just as I was leaving the embassy, on my way to Admiral Sims's office, I met the admiral in the street, stopped him and introduced myself, and then entered into a conversation with him, which lasted about 5 or 10 minutes. During the conversation, which was almost exclusively with reference to our Navy and its operations, in my enthusiasm I remarked that our Navy had been of great importance during the war and had accomplished splendid results. The admiral promptly disabused my mind of this view, and while I do not attempt to quote him exactly, yet I recall distinctly that his statement was to the effect that our Navy was small and ineffective, as compared with the British Navy, and our achievements had amounted to but little during the war; that England had protected us upon the seas and we could always rely upon her to do so, and that in view of this friendship there was no necessity for us to desire a Navy which would in any way equal that of Great Britain. I was surprised at the admiral's statement and politely but plainly told him so. When I bid him good-by I remember that I stated to my son, who was with me, that the admiral should be in the British Navy and on their pay roll and not on ours.

I do not know whether you care to make use of this letter, but as I am strongly of the opinion that the American people are entitled to know the full viewpoint of Admiral Sims with reference to our Navy, you are at liberty to make such use of it as you may see fit.

Sincerely, yours,

C. C. CARLIN.

I have put it in the record.

SIMS ORIGINATED NO NEW PLANS OR POLICIES.

If Admiral Sims originated a single one of the important policies or first suggested one important measure the United States Navy put into effect during the war, I can not recall it.

The most important things done by the Navy during the war, all of which originated in the Navy Department, were:

1. Close cooperation with the Allies.

This had been decided upon, in case of war, long before war was declared, and before Sims ever went abroad. In fact, he was sent to London in pursuance of this policy.

(See Admiral Sims's letter of Jan. 7, 1920, pars. 6 and 8.)

6. In the latter part of March, 1917, in response to a request from the American ambassador in London, expressing the desire of the British Government that a naval officer of high rank be sent to secure the closer cooperation which our Navy Department had suggested—

Now, bear in mind, Mr. Chairman, he says "which our Navy Department had suggested"—

I was ordered abroad on barely 48 hours' notice.

8. I assumed that my mission was to confer with the heads of the allied navies to learn the actual situation and to discuss means for naval cooperation in case the United States declared war against the Central Powers.

This cooperation was put into effect on this side of the water and a thorough working agreement had been arranged with the British and French Navies before the Navy Department ever heard a word from Admiral Sims, except the one-line cable announcing his arrival.

Sims arrived in London April 10, 1917. His first dispatch regarding the situation was sent April 14. War was declared April 6, and

we immediately got in touch with the representatives of the Allies in Washington, and arranged a conference with the commanders in chief of the British and French forces in the western Atlantic, Vice Admiral Browning, and Rear Admiral Grasset. Admirals Benson, Mayo, and Wilson, conferred with them at Old Point, Va., April 10, the day Sims reached London, and the next day all these admirals held a conference with the Secretary of the Navy and the General Board in the Navy Department at Washington. Within the week after war was declared the allied and American naval representatives had discussed the whole situation; we had asked them to tell us how best the United States Navy could aid them and the allied cause, and we had agreed at once to their suggestions. This agreement had been concluded before we ever heard from Sims.

The day before Sims sent his first dispatch from London, Admiral Browning, British commander in chief in the western Atlantic, had sent the following dispatch to the British Admiralty, detailing the agreement for cooperation:

APRIL 13, 1917.

The Commander in Chief to the naval attaché, via Ambassador, Washington.

Your 246. Following are points of agreement arrived at with United States Navy Department; French admiral sending telegram to Paris; question raised with British Admiralty:

(1) One squadron immediately ready to proceed from North Atlantic port on receipt information of escape raider. Operations this squadron will be coordinated with allied squadrons. Area of operations, Cape Sable to longitude 50° west, thence south to parallel 20 N. E.

(2) Second squadron on coast of South America will be provided as soon as possible in near future. Area from Brazilian coast parallel 5 south to meridian 30 west, thence south to 15 south, etc.

(3) Six destroyers will be sent over in immediate future, based on British and French ports.

(4) United States will look after west coast of North America from Canadian to Colombian boundaries.

(6) United States China squadron be maintained for present.

(7) United States supervise Gulf of Mexico and Central America.

(8) On appearance enemy submarine to send submarines to Canadian coast, etc. Small patrol vessels for French coast will be supplied when available. Armed naval transport for carrying railway material to France to be furnished.

(NOTE—Paragraph (5) is omitted, as it relates to another country, and ought not to be printed.)

The Secretary of the Navy, the Assistant Secretary of the Navy, Admiral Benson, Chief of Naval Operations, Admiral Mayo, commander in chief of the United States Atlantic Fleet, Admiral Wilson, commander of the patrol force, and the members of the General Board took part in these negotiations, and the British and French representatives were impressed with our earnest desire to do everything possible to aid the Allies. In fact, we strove to do more than they asked. Admiral Browning suggested that one or two American destroyers be sent. Admiral Benson and Admiral Mayo agreed with me that we would not like to send less than a division, and we agreed to send a division (6) and orders were given at once. On April 14, the Eighth Division, destroyer force, sailed for its home yards to "fit out for distant service." As agreed upon, we promptly took over the patrol of the western Atlantic, relieving British and French vessels then engaged in that patrol, to other duty. We took over the patrol of the Pacific (west) coast from Canada to South America. We brought the

major part of the Pacific Fleet, under command of Admiral William B. Caperton, to the Atlantic and took over the patrol against raiders of the Gulf, Caribbean, and the east coast of South America; we supervised allied interests in the Gulf of Mexico and Central America. We sent armed yachts to the French coast as soon as they could be secured, and converted into patrol vessels. Every feature of this agreement was carried out promptly.

I might add, Mr. Chairman, that at the conference at the office of the General Board, attended by all these gentlemen, we had maps on the wall, and about 95 per cent of the conversation in that conference was with reference to our taking over the protection of this coast. You will recall that all during the war the British and the French had kept ships on this side of the Atlantic to protect commerce, and the chief thing they desired us to do, and what they put most emphasis upon, was that we should take charge of patrolling the coast from Canada to South America, the Caribbean and the Gulf of Mexico, so that they could release their ships and take them back to service on the other side of the ocean.

SENDING ANTISUBMARINE CRAFT TO EUROPEAN WATERS.

We had decided on the policy of sending antisubmarine craft to the war zone before we ever heard a word from Admiral Sims. The orders to the Eighth Division, Destroyer Force, were issued before Sims's first dispatch was received.

Even though Sims, in his first dispatch (dated London, April 14) had informed us, "It was very likely the enemy will make submarine mine-laying raids on our coast or in the Caribbean," and we realized that the Germans could at any time send U-boats to attack our coasts, his recommendation that the "maximum number of destroyers be sent" was in accord with our own ideas and policy. The department cabled him on April 16:

Yours of noon 14th April will be given earnest and serious attention.

We followed entirely the recommendations Sims made in his dispatch of April 16, which read as follows:

Strongly advise that any destroyer or other patrol forces sent this side do not base on French coast but as far to westward as practicable south coast Ireland to operate principally in designated high-sea area in zone to westward and southward which is present critical area.

All the destroyers we dispatched in the next three months were sent to Queenstown for operation in that area, and were put under direct command of the British commander in chief of the coasts of Ireland, to secure the highest degree of cooperation.

Admiral Sims sent, as he says, on April 15, 17, 23, and 24, dispatches all of the same tenor requesting additional forces. We were carefully considering all our resources, to determine the maximum number of effective antisubmarine craft we could send to Europe in the shortest time. All Sims's dispatches were taken into consideration, but they were general in their nature, and it was not until his dispatch of April 28 that he mentioned definite numbers, and stated that the British Admiralty and war council had "decided"—now, I wish to emphasize this: on April 28 he said that the British Admiralty and war council had decided—

That cooperation of twenty-odd American destroyers with base at Queenstown would no doubt put down the present submarine activity, which is dangerous, and keep it down.

The Eighth Division (six destroyers) had sailed four days previous and arrived at Queenstown on May 4. On May 7 another division sailed, and by the end of May 30 vessels—28 destroyers and 2 destroyer tenders and repair ships had either arrived at Queenstown or were on the way. Although we sent 30, Admiral Sims had told us on May 28 that the Admiralty and the war council wished 20, and stated there was no doubt that if we would send 20 they could put down the submarine activity and keep it down.

Thus we had dispatched, within a month, more than the British war council and Admiralty had decided were needed to "put down" the dangerous submarine activity in that area and "keep it down."

THIRTY VESSELS ON THE WAY BEFORE END OF MAY.

Following is a list of United States naval vessels which sailed for duty in European waters in April and May, 1917:

Name.	Type.	Date of sailing.	Name.	Type.	Date of sailing.
Conyngham.....	Destroyer.....	Apr. 24, 1917	Cushing.....	Destroyer.....	May 15, 1917
Davis.....	do.....	Do.	Nicholson.....	do.....	Do.
McDougal.....	do.....	Do.	O'Brien.....	do.....	Do.
Porter.....	do.....	Do.	Sampson.....	do.....	Do.
Wadsworth.....	do.....	Do.	Drayton.....	do.....	May 21, 1917
Wainwright.....	do.....	Do.	Jenkins.....	do.....	Do.
Cassin.....	do.....	May 7, 1917	Patterson.....	do.....	Do.
Erricson.....	do.....	Do.	Paulding.....	do.....	Do.
Jacob Jones.....	do.....	Do.	Tripp.....	do.....	Do.
Rowan.....	do.....	Do.	Warrington.....	do.....	Do.
Tucker.....	do.....	Do.	Sterrett.....	do.....	May 23, 1917
Winslow.....	do.....	Do.	Walke.....	do.....	Do.
Melville.....	Destroyer tender.	May 11, 1917	Jarvis.....	do.....	May 25, 1917
Benham.....	Destroyer.....	May 15, 1917	Perkins.....	do.....	Do.
Cummings.....	do.....	Do.	Dixie.....	Destroyer tender.	May 31, 1917

Total, 30 vessels—28 destroyers and 2 destroyer tenders.

BRITISH HAD ONLY 4 TO 15 DESTROYERS AT QUEENSTOWN.

How many destroyers did the British have fighting submarines and protecting shipping at this "critical area"?

Admiral Sims, in his book, *The Victory at Sea* (World's Work for September, 1919), says the British had, when we entered the war, in April, 1917, about 200 destroyers, the use of which had been determined as follows:

In April, 1917, the Admiralty had decided to give the preference to the Grand Fleet, the hospital ships, the channel crossing, and the Mediterranean, practically in the order mentioned. It is evident from the figures given that all but about 10 or a dozen destroyers must have been used in these three areas. It was for this reason that the great zone of trans-Atlantic shipping, west and south of Ireland, vitally important as it was, had to go almost unprotected. Sometimes only four or five destroyers were operating in this great stretch of waters; I do not think the number ever exceeded 15.

Then Admiral Sims goes on to say:

The area of the destroyer patrol off Queenstown comprised about 25,000 square miles; in other words, the complete protection of the trans-Atlantic trade routes would have taken about 25,000 destroyers. And the British, as I have said, had available anywhere from 4 to 15 in this area."

AMERICANS FURNISH PRACTICALLY ENTIRE QUEENSTOWN FORCE.

Admiral Sims states (p. 55, *World's Work* for November, 1919)—I would like to emphasize this. He states as follows:

Not long after our destroyers arrived at Queenstown most of the British destroyers left to reinforce the hard-driven flotillas in the Channel and the North Sea, so that the destroyer forces under Admiral Bayly became almost exclusively American.

SIMS'S OWN FIGURES CONTRADICTIONARY.

Admiral Sims, in his testimony before this committee, when asked how many destroyers we had in European waters by the end of June, said we had 20. Your committee would not be justified in inferring from this that he lost the other eight that had been sent. Stating that he had only 20 when the records show 28 were at Queenstown the first week in June is remarkably accurate for Admiral Sims. Though the "Summary of activities of United States naval forces operating in European waters," made up and issued by his own headquarters for the information of the press just before he left London in 1919, states that our total forces in European waters July 1, 1917, were 22 vessels—20 destroyers and 2 tenders and repair ships—and that we had only 30 destroyers there by October 1, Admiral Sims, in his magazine articles entitled "The victory at sea," states (*World's Work* for November, 1919, p. 61):

By July 5 we had 34 destroyers at Queenstown.

And he has told that the British Admiralty and the war council had said that if we would send 20 there was no doubt that the submarine trouble could be put down and kept down.

Great Britain had some 350 destroyers when we entered the war in 1917. The following table shows the number of British destroyers that were based on Queenstown from April 1 to October 1, 1917:

Apr. 1, 1917....	0	June 1, 1917...	1	Aug. 1, 1917...	2	Oct. 1, 1917...	0
May 1, 1917....	0	July 1, 1917...	4	Sept. 1, 1917...	0		

Look at that. How many did they have based on Queenstown on April 1, 1917? None. How many did they have on May 1, 1917? None. How many did they have on June 1, 1917? One. How many on July 1, 1917? Four. How many did they have on August 1, 1917? Two. How many on September 1, 1917? None. And on October 1, 1917? None.

ESTABLISHMENT OF NAVAL BASES.

The most important naval bases we established in Europe, so far as concerned American shipping and transport, were those at Brest and Bordeaux. It was through these ports that American troops poured by hundreds of thousands, and supplies and materials by millions of tons. Yet one of the complaints Sims voices in his letter of January 7 is that we announced our intention to establish these bases not only without waiting for his recommendation, but when he had recommended otherwise. In his letter he says (par. 64):

64. For example, on May 8, without previous explanation—

Of course we never did stop to make explanations to Sims when we had a policy to carry out—

the department announced its intention to establish naval bases at Bordeaux and Brest, although on May 5, it had been informed of the results of a conference with the French naval authorities and their agreement that our forces should remain concentrated at that time in the area of greatest enemy activity.

He cites this as an instance of "the department's dealing directly from Washington with European naval officials in Europe," instead of depending entirely upon "its own representative" (himself). As a matter of fact the said "European naval officials" were not in Europe but in Washington. They were members of the special war missions sent over by France and Great Britain, and were far more familiar with the situation than Sims was. They had come fresh from Europe, charged with the duty of making exactly such arrangements as this directly with the Navy Department. It was apparent to them and to us that the transportation and supply of a great American Army would make the use of French ports, and the establishment of naval bases at the ports most suitable, a matter of the highest importance. As we wanted to set about this as soon as possible, we determined, on their advice, to establish at once temporary bases at Brest and Bordeaux. But before the final decision was made, we not only notified Admiral Sims, but asked his advice. Following is the dispatch [reading]:

MAY 7, 1917.

Admiral Sims, *London*.

French have requested and department contemplates establishing temporary base at Bordeaux and at Brest, one line officer in charge, one pay officer, one engineer officer. What do you advise? Expedite reply.

JOSEPHUS DANIELS.

Sims's reply was as follows:

To: Secretary Daniels.

While it is very desirable to establish temporary bases Brest and Bordeaux, necessary repair, supply and fuel vessels should not be on that account diverted in any way from mobile destroyer base. It is most urgent that destroyer force remain concentrated with mobile base ready to follow any movement of main submarine activity in high-sea trade routes.

Services of Capt. Pratt and aid urgently needed and I respectfully request information as to their probable date of arrival. 16008.

SIMS.

This dispatch, as well as the one he says he sent May 5, but which was not received by the department until May 8, reveals that the reason for his protests was not that these bases were not highly important, but that their establishment threatened to conflict with a scheme he had arranged, without waiting for the approval of the department, for the concentration of all our forces in British waters. Here is the dispatch he dates May 5, and which was received May 8:

Secretary DANIELS:

Our relations with the minister of marine very satisfactory. Conferences with minister and chief of staff and the French naval attaché at London, England, the British naval attaché at Paris, France, and the First Lord of the Admiralty, resulted in unanimous agreement our destroyers to remain concentrated and attack enemy submarines in whatever area they may be operating in greatest numbers probably principally in area from south to west northwest of Fastnet. I arrive in London May 6.

SIMS.

YEAR LATER ADMITTED BREST WAS BEST BASE FOR ESCORT VESSELS.

For months after Brest had become the center of American troop and supply activities, Sims continued to base all our destroyers on Queenstown. It was more than a year after we entered the war before he consented to transfer any considerable number of destroyers from Queenstown to Brest. In his letter to Admiral Bayly, of the British Navy, June 1, 1918, detailing why he felt compelled to transfer a part of the destroyers, under his command, Sims sets forth in detail the decided advantages of Brest over Queenstown as a base for escort vessels.

In that letter he said: -

Referring to your letter of May 29, concerning the relative advantages and disadvantages of escorting troop convoys by destroyers based on Queenstown and on Brest, I have had this matter analyzed by Commander Long, in consultation with the convoy section of the Admiralty, and I inclose herewith two memorandums covering these points. I also inclose your letter of the 19th, as you may not have retained a copy of it.

From an examination of these memorandums, it now seems that it would be really advantageous to base the escorting destroyers for our troop transports on Brest.

We had advocated that all along.

You will note from the inclosed memorandums that a troop escort based on Queenstown steam approximately three legs of a triangle as follows: Four hundred and eighty miles to the rendezvous not escorting; 600 miles to the French port, escorting; 380 miles back to Queenstown not escorting; in all 860 miles not escorting and 600 miles escorting—1,460 miles in all.

With the destroyers based on Brest, the legs of the triangle are as follows: Five hundred and ten out to the rendezvous escorting troops into the coast; 150 miles returning to Brest from St. Nazaire in case the latter port is the port of destination. In all this is 1,110 miles escorting and about 150 miles not escorting, a total of 1,260 miles.

From this it is evident that destroyers based on Brest can be used with much greater economy of both destroyers and oil.

Now Admiral Sims learned all that a long time after we had determined to put it into effect in Washington.

SENDING OF FORCES TO GIBRALTAR.

Gibraltar was the gateway of the Mediterranean through which passed one-fourth of all the allied shipping in the world. If we were to make our forces effective in carrying on the convoy system, it was essential that we establish a base and send forces there. You would have thought that one of the first suggestions from Sims, after the practicability of convoy was demonstrated, would have been in sending of forces to Gibraltar. Not only did he not recommend this, but complains because the department initiated this activity. He says in his testimony:

The first indication that I had that the department intended to send forces to Gibraltar was in a message of July 5, in which they said:

"Department is strongly impressed with the necessity for adequate antisubmarine patrol in and off entrance to Gibraltar. Ten vessels are available to send across, if considered that they can be of value."

The point to be emphasized here is the fact that such a decision as to disposition of forces in European waters, was made by the department, without reference to their representative abroad, who was in a position to thoroughly understand all individual allied requests for assistance, and determine priority in accordance with departmental instructions and the needs of the situation.

I replied to this, after consultation with the Admiralty, that the vessels of the gunboat class, named by the department, would be very useful for antisubmarine work at Gibraltar.

Very useful, the admiral thought. We knew it here, and decided to send them over before he complained about it [continued reading]:

I realized that this was a digression from the policy which I had been insisting upon the start, of concentrating all reinforcements in the critical area. However, I felt that I could not possibly explain the necessities therefor any more fully or clearly, and it seemed now to me that I should grasp any opportunity of getting forces across the ocean. Their subsequent disposition could be determined later. It was quite true that forces were needed urgently in all areas. The lines of communications to the armies in the near and far East were being hard hit at this time by submarine operations in the Mediterranean. It was simply a case of accepting the best that could be obtained.

It was accordingly informed by the department on July 14, 1917, that 11 vessels, which had been named in previous messages, and included gunboats and light cruisers, had been directed to prepare for distant service under the command of Admiral Wilson, and would sail for Gibraltar at the earliest possible date.

Events thoroughly proved the wisdom of establishing the base at Gibraltar, Brest, and Bordeaux and sending forces there as early as possible, and showed how mistaken was the policy urged by Admiral Sims, that all our forces be "concentrated" in British waters.

TROOP TRANSPORTATION.

The great machinery of troop transportation, the cruiser and transport force, was initiated by the Navy Department, organized, built up, and operated not by Admiral Sims, but by other officers not under his command. His duty in this connection consisted solely of arranging routes, and providing escort vessels through the submarine zone, and in the performance of this latter and vitally important duty he had to be reminded, time and again by the department—bear this in mind, now, gentlemen, that with reference to the duty of protecting American troops in transport through the submarine zone, Admiral Sims had to be reminded time and again by the department—that the paramount duty of our destroyers, with which nothing must interfere, was the fullest protection of ships carrying American troops. Capt. Pratt and other naval officers have told you that carrying and safeguarding troops to France was the greatest service rendered by the Navy during the World War.

TRANSPORTING SUPPLIES AND MUNITIONS TO EUROPE.

Cargo transportation of supplies, materials, and munitions for the American forces in Europe and the allied armies was initiated by the Navy Department, organized and operated, not by Admiral Sims, but by other officers not under his command. The Naval Overseas Transportation Service, which embraced the largest ocean-going fleet in the world, was built up by the Navy Department; and was not suggested by Admiral Sims, whose only duty in connection therewith was in routing and providing escorts for convoys.

THE NORTH SEA MINE BARRAGE.

The North Sea mine barrage, the largest ordnance project of the kind ever accomplished and the most important measure that could have been taken to curb the submarines, not only was initiated in

the Navy Department, but was carried out by the Bureau of Ordnance, and the United States Navy's mine force laid four-fifths of the barrage. This was not only not suggested by Admiral Sims, but he actively and strenuously opposed it; rejecting the propositions we made in April and May, 1917, as unfeasible, and he carried his opposition in for the naval allied conference in London, September 4-5, 1917, at which Admiral Mayo, presented the proposition. The opposition of Sims and the British Admiralty resulted in six months' delay in the adoption of the plan we proposed for a barrage across the North Sea.

BUILDING UP A NAVAL PERSONNEL OF OVER 500,000.

The unprecedented increase in personnel, which resulted in building up a Navy of over 500,000 enlisted men and 32,000 officers; their enlistment and training was inaugurated and carried out by the Navy Department, and the recruiting and training campaign was under way before Admiral Sims was sent to Europe. As Capt. Laning and Capt. Palmer have shown, if, as Sims requested nearly all our experienced officers had been sent to Europe in the first year of the war, the training of such a large force would have been impossible.

CONSTRUCTING 1,000 WAR VESSELS.

The Navy Department, before Admiral Sims was ever sent to London, determined upon the building of large numbers of antisubmarine craft, and in March—in March, bear in mind, before we entered the war—and early in April let the contracts for 355 submarine chasers and all the destroyers that were then authorized by Congress. The vast building program, which involved 1,000 war vessels, was determined upon by the department, on its own initiative, and carried out under the direction of Admiral Taylor, Chief of the Bureau of Construction and Repair, and Admiral Griffin, Chief of the Bureau of Steam Engineering.

UNITED STATES NAVAL RAILWAY BATTERIES.

The United States naval railway batteries of 14-inch guns, the largest mobile artillery ever built and the most powerful artillery used by the Allies on the western front, were designed and constructed by the Navy Department and manned and operated by forces organized and trained here. The suggestion of creating these batteries was made by the Bureau of Ordnance, under whose supervision they were built, shipped to France, and there set up. They operated with the allied and American armies, under direct command of Admiral Plunkett. Sims had nothing to do with their building or operation.

SENDING NAVAL AVIATORS TO EUROPE.

The department had decided upon the building up of a large aviation corps and the sending of naval aviators to Europe before it ever received from Admiral Sims any suggestion as to sending aviators abroad. Though we had few trained aviators and mechanics, we

sent aviators abroad within two months after war was declared, and the naval aviation detachments which reached Bordeaux and St. Nazaire the first week in June, 1917, were the first of the American armed forces to land in France.

ARMING AMERICAN MERCHANT SHIPS.

The arming of American merchant ships for protection against submarine attack, not only the most effective method of protection before the convoy system was adopted, but practically the only measure we could take before the declaration of war, was prepared for in February, immediately after the breaking off of relations with Germany, and put into effect by order of the President March 14, 1917, before we had entered the war and two weeks before Sims sailed for Europe. Though this proved more successful than any other policy that had been in use until the convoy system was put into effect and proved its value throughout the war, it was not only not suggested by Admiral Sims, but he persistently opposed it and repeatedly declared it practically worthless in spite of evidence to the contrary.

BUILDING UP OF LARGE MARINE CORPS FOR SERVICE WITH ARMY IN FRANCE.

The building up of the Marine Corps from 13,500 to a force of 75,000, and the sending of marines to serve with the United States Army, which proved one of the most brilliantly successful achievements of the Navy in the war, was inaugurated and carried out by the Navy Department, without any suggestion of Admiral Sims, and in this he had no part whatever.

ADMIRAL SIMS REPRIMANDED BY PRESIDENT TAFT AND TWO SECRETARIES OF THE NAVY—OTHER CASES OF INSUBORDINATION.

When Admiral Sims was selected to become confidential representative of the Navy abroad, with the duty of conferring with our ambassador and making reports upon conditions of naval operations by the allied forces, I knew of his Guildhall speech, in which he said.:

If the time ever comes when the British Empire is seriously menaced by an external enemy, it is my opinion that you may count upon every man, every dollar, every drop of blood of your kindred across the sea.

I knew that he had an intimate acquaintance with British naval officers and officials which would secure exchange of views and information desired by us for immediate cooperation if Congress declared war against the Imperial German Government. I thought then that his utterance at Guildhall was an indiscretion made in an after-dinner speech, occasions which have betrayed men time out of mind of doing what, in the common vernacular, is called "slopping over." I did not know until long afterwards that it was an obsession, and that Admiral Sims had a mind which genuflected to British views and at times was closed to the views of his superiors in his own country, if, for example, as happened the views and opinions of the American Navy Department were different from the views and

opinions of the British Admiralty. That knowledge came later and only after the culminating statements Admiral Sims made to Senator Glass, Congressmen Byrnes, Whaley, and Carlin, and Gen. Bliss, and his own statements in letter and otherwise.

Of course, I had heard about, but had never read, the reprimands that President Taft and Secretary Meyer had given him as the following official correspondence shows. This is to Secretary Meyer. [Reading:]

THE WHITE HOUSE,
Washington, January 9, 1911.

MY DEAR MR. SECRETARY: I am informed by you that the Lord Mayor of the city of London, on December 3 last, entertained at dinner 800 men of the United States Fleet; that the men were commanded by Commander W. S. Sims; that Commander Sims, in reply to the address of welcome of the Lord Mayor, used these words:

"If the time ever comes when the British Empire is seriously menaced by an external enemy, it is my opinion that you may count upon every man, every dollar, every drop of blood of your kindred across the sea."

You ask me whether the delivery of such a speech under the circumstances calls for action by the department. I think that it does. The Navy is used much as an instrument of peace. One of the chief functions that its officers perform when they visit foreign ports is the representative one of conveying to all nations the good will of the United States. An important part of the education of a naval officer, therefore, is instruction in international law and diplomatic usage. He is under special obligation to see to it that what he does or says shall not embarrass his Government in its foreign relations.

Whenever he is called upon in a foreign country to speak in public, so that what he says will necessarily be brought to the attention of the people of other foreign countries, it is his obvious duty to avoid invidious comparisons and to limit his speech and his expressions of friendship for the country whose guest he is to use language that will not indicate a lack of friendship toward other countries.

I am aware that upon the sudden spur of the moment and under the enthusiasm of a cordial welcome, grateful words crowd to the lips of the guest, the whole effect of which it may be difficult for him to measure. It should be, however, the business and training of a naval officer under such an impulse to restrain himself within the limits of diplomatic intercourse. To depart from it is not only a blunder, but a fault for which his government can not excuse him. Commander Sims can not escape censure on the ground that what he said was a mere expression of his personal opinion. Under the circumstances he must speak as an official representative and he should have known that the words he used would at once call for severe comment in other countries than Great Britain, and might involve this Government in explanation and disclaimer.

For these reasons I direct that a public reprimand be given to Commander Sims. His offense has been so conspicuous that the action of the department in reproving it should be equally so.

Sincerely, yours,

WM. H. TAFT.

HON. GEORGE VON L. MEYER,
Secretary of the Navy.

Secretary Meyer issued the following:

A public reprimand is hereby administered to Commander W. S. Sims, United States Navy, and will be entered upon his official record. The gravamen of the offense is so clearly set forth in the above quoted communication from the President that no additional remarks appear necessary to indicate to the naval service the lack of tact and knowledge of the plain duty of an officer of the Navy exhibited by Commander Sims upon the occasion mentioned and to prevent a repetition of such a regrettable occurrence.

G. V. L. MEYER,
Secretary of the Navy.

This was not the only reprimand given to Admiral Sims by the Navy Department. At another time because he was guilty of being "Insubordinate in character, disrespectful to the department and to your commander in chief," he was reprimanded by the Navy

Department. The letter of reprimand, sent to him by the Acting Secretary under date of November 1, 1910 (file No. 5688-1553) is as follows:

SIR: The department returns through official channels your communication dated October 20 that it may be revised and submitted in respectful language.

Your attention is called to the following extract on page 9 of your report:

"Whether rightly or wrongly, it is universally believed in the fleet that the application of these rules has inflicted grave injustice upon certain vessels. It is not essential whether or not this is technically true, since the essential element that makes for intensity of competition is this very belief as to its substantial justice. As specific instances of this, it may be noted that the application of rules governing the weight assigned to mines, and the consequent shifting of the relative standing of ships, as well as the classing of the *South Carolina* with ships that carried out their practice in a twisting seaway, are generally regarded in the fleet with derisive disapproval."

The Secretary of the Navy goes on to say:

The implied criticism of your superior officers in the above-quoted paragraph, and especially in your statement that the application of the present rules governing target practice which were adopted and approved by your superior officers, are "generally regarded in the fleet with derisive disapproval." is insubordinate in character, disrespectful to the department and to your commander in chief, and such as an officer of your age and experience should under no circumstances have been guilty of. It evinces a lack of military subordination to and respect for superior authority, much to be regretted.

You will rewrite page 9 of the communication above referred to, omitting therefrom the parts above quoted, and return the amended paper, together with the original of page 9, through official channels to the department.

Very respectfully,

BEEKMAN WINTHROP,
Acting Secretary of the Navy.

Commander W. S. SIMS, UNITED STATES NAVY, COMMANDING U. S. S. "MINNESOTA,"

Through the commander in chief, United States Atlantic Fleet.

Full facts of occasions of other insubordination are not on file in the Navy Department, but Burton J. Hendrick, an intimate and ardent champion and biographer of Sims, in his fulsome article in praise of Admiral Sims in *World's Work*, gives some incidents showing glowing commendation of insubordinate practices long before I became Secretary of the Navy, which are contrary to naval tradition, naval regulations, and naval discipline. I quote from the article in the *World's Work*, August, 1919:

Pages 376-385:

For many years Americans who were interested in their Navy had known Admiral Sims as the most vigorous, intelligent, and courageous officer on its rolls—as the one man, indeed, who had been chiefly responsible for its efficiency and fighting power. Others who followed naval matters less closely were familiar with his name as one that had appeared periodically in the public print, usually in connection with some startling, even sensational episode; with these the name of Sims signified a spirit of revolt, a man who was constantly rebelling against authority and tradition, a trouble-maker in the Navy, possibly even a character dangerous to international peace.

Page 386:

Washington began to realize that an active mind was working at naval problems in 1895, when Sims, then located at the China station, began to send home reports most of which were insubordinately critical of naval types and naval administration.

Like most thinkers who startle their associates with ideas, Sims merely unearthed a few obvious facts. His discovery, while not particularly recondit, was startling and shocking. Most Americans of that time thought that they possessed a wonderful Navy, but Sims now told them that their Navy was a joke. While the Nation was going wild over our achievements against the Spaniards in 1898, and especially rejoic-

ing over our skilful shooting, this disgusted naval attaché in Paris informed his chiefs that in any battle with a first-class naval power the American fleet would meet precisely the same fate as that which had befallen the Spanish ships at Manila and Santiago. In such a battle, wrote Sims, the United States would not achieve even respectable defeat—the thing could end only in absolute disaster. "One British ship," he said,

That was immediately after the Spanish War—

"could easily dispose of four or five American vessels of corresponding type."

The article continues (pp. 390–391):

All this time Sims had been calling attention to faults in the Navy that were even more serious, especially in the construction of ships. He first stepped on an American "modern" battleship in 1900; this was the *Kentucky*, then at Gibraltar en route to China. The experience was a shocking revelation. "The *Kentucky*," the admiral says, "is not a battleship at all. She is the worst crime in naval construction ever perpetrated by the white race." * * *

From 1900 to 1907 Sims kept up his solitary campaign against these errors; his reports, as already described, were committed to the flames. Finally he decided on another unprecedented move, which was one even more insubordinate than his letter to the President. This time he took his cause directly to the American people itself. He summoned his friend, Mr. Henry Reuterdaahl, the marine artist, and asked him to prepare a popular magazine article describing the defects of our ships as set forth in his reports.

The moment chosen for this exposé was a dramatic one; it appeared in McClure's Magazine, in January, 1908, just when the American Navy started on its historic cruise around the world. Probably no single article ever published in this country caused such a sensation. However insubordinate his procedure may have been, Commander Sims had at least achieved his purpose of focussing popular attention upon the defects in American warships. For weeks the newspapers all over the country talked of little else; the editorial office of McClure's received tons of clippings referring to its "unpatriotic article." Senator Hale, then chairman of the Naval Committee, started an investigation for the express purpose of proving that Mr. Reuterdaahl and his abettors—suspicion immediately fixed on Commander Sims—were liars of unprecedented magnitude. When this investigation had reached its most exciting stage, Commander Sims received this rather formidable communication from his chief, the Secretary of the Navy:

NAVY DEPARTMENT,
Washington, February 15, 1908.

SIR: The department having had brought to its attention a very unusual similarity between statements made by you in various communications to the Secretary of the Navy, and some of those contained in an article entitled "The needs of our Navy" in the January number of McClure's Magazine, over the signature of Mr. Henry Reuterdaahl, you will please submit, immediately, categorical and specific statement on the following points:

"Did you, directly or indirectly, furnish to Mr. Reuterdaahl, or to any one acting for that gentleman, or for any other individual, information which could justly be regarded as an adequate foundation upon which to base the various statements contained in the above-noted article under the following captions:

"A fleet with main armor under water," "Our investment in ships with submerged armor," "The lowness of American ships," "One-third of guns useless in a seaway," "The open shaft to the magazine," "The danger from exploding shells," "The poor protection for gun crews," "Insufficient ammunition hoists," "Lack of torpedoes and destroyers," "Ten days of battle drill in nine years," "The bureau management of the Navy," "Fifteen years' fight for a safe turret," and "Our first need."

The Secretary of the Navy continued:

The department desires that your statement be categorical and explicit as to whether or not you have communicated, directly or indirectly, publicly or privately, to editors of papers or their representatives, or to any other persons, information which could be justly used as a foundation for sensational statements of the character in the article which appeared in the January number of McClure's Magazine.

If you have not, either directly or indirectly, supplied such information, the department desires explicit information as to whether you are prepared to assume responsibility for the truth of any of the important statements therein contained under the above-noted captions, and if such be the case, a brief and explicit indication of the statements in which you concur.

Respectfully,

V. H. METCALF, *Secretary.*

Commander Wm. S. SIMS, United States Navy,
Bureau of Navigation, Navy Department, Washington, D. C.

Now I go on to quote from Mr. Burton J. Hendrick:

Meanwhile a comedy was being played under the surface. There is no harm in saying now that, while President Roosevelt had not inspired the Reuterdaahl article, he knew that it was in process of incubation and that he was glad to have it published. With all his personal force and all the advantages of his position he had not succeeded in making the essential changes in the Navy Department's construction plans, and he realized that publicity was the only cure. When Commander Sims received Secretary Metcalf's letter, therefore, he at once took it to the President.

"Apparently they intend to court-martial me," he said.

"Well, don't you deserve it?" answered the President. "Haven't you been insubordinate?"

"Yes"; Sims replied, "just as insubordinate as you were on a famous occasion."

This reference to Roosevelt's "Round Robin" in the Spanish War brought loud guffaws from the Chief Executive. After Commander Sims left, he sent for the Secretary of the Navy and directed him to drop all court-martial proceedings.

This article shows a spirit of pride in continued insubordination to authority, as disclosed in this evidently inspired story, little of which I was familiar with when Admiral Sims was intrusted with the confidential mission to London. If I had fully understood and properly assessed his past attitude and conduct with respect to the highest spirit of loyalty he would not have been sent.

SIMS NEEDED TO LEARN AND FOLLOW THE ADMONITIONS IN WASHINGTON'S FAREWELL ADDRESS.

The Guildhall speech Admiral Sims made should have caused me, before he departed for London, to have given him a copy of George Washington's "Farewell Address," with the "explicit admonition" to read and inwardly digest and practice the following wise admonitions:

The name of American, which belongs to you, in your national capacity, must always exalt the just pride of patriotism more than any appellation. * * *

Nothing is more essential than that antipathies against particular nations and passionate attachment for others should be excluded. * * *

Sympathy for a favorite nation, facilitating the illusion of an imaginary common interest in cases where no real common interest exists, and infusing into one the enmities of the other, betrays the former into a participation in the quarrels and wars of the latter, without adequate inducement or justification. It leads also to concessions to the favorite nation of privileges denied to others, which is apt doubly to injure the nation making the concessions; by unnecessarily parting with what ought to have been retained and by exciting jealousy, ill will, and a disposition to retaliate in the ambitious, corrupted, or deluded citizens (who devote themselves to the favorite nation) facility to betray, or sacrifice the interests of their own country without odium, sometimes even with popularity, gilding with the appearances of a virtuous sense of obligation, a commendable deference for public opinion, or a laudable zeal for public good, the base or foolish compliances of ambition, corruption, or infatuation.

As avenues to foreign influence in innumerable ways, such attachments are particularly alarming to the truly enlightened and independent patriot. How many opportunities do they afford to tamper with domestic factions, to practice the arts of seduction, to mislead public opinion, to influence or awe the public councils. Such an attachment of a small or weak toward a great and powerful nation dooms the former to be the satellite of the latter.

Against the insidious wiles of foreign influence (I conjure you to), believe me (fellow citizens), the jealousy of a free people ought to be (constantly) awake, since history and experience prove that foreign influence is one of the most baneful foes of republican government. But that jealousy to be useful must be impartial; else it becomes the instrument of the very influence to be avoided, instead of a defence against it. Excessive partiality for one foreign nation and excessive dislike of another, cause those whom they actuate to see danger only on one side and serve to veil and even second the arts of influence on the other. Real patriots, who may resist the intrigues of the favorite, are liable to become suspected and odious; while its tools and dupes usurp the applause and confidence of the people to surrender their interests. * * *

VIEWS UPON THE LESSONS OF THE WAR INVITED.

Before Admiral Sims made public his letter entitled "Lessons of the World War," the Chief of Operations, after consultation with other able officers, had prepared an order calling upon all officers "while the events of the war are fresh in the minds of all," to make recommendations looking to improvement. That order, as soon as it was perfected, was signed by me and promulgated. It was the naval way of securing the results of study and participation in war for the consideration of the thoughtful men in the service. Much can be learned from all wars, particularly from the World War which was unlike any other war, and the department so far from not wishing the frankest discussion of the lessons of war, including any mistakes that could be avoided in future wars, actually had prepared an order for just such study and discussion. The purpose of the order was to secure a serious professional naval examination, free from personalities or reflections, of lessons taught by the war for the good of the service and the good of the country. It is well to show the large scope of the information desired and the recommendations solicited. The general order is as follows:

General Order)
No. 516. }

NAVY DEPARTMENT,
Washington, D. C., January 17, 1920.

1. While the events of the war are fresh in the minds of all, it is considered essential to collect and record all suggestions and recommendations for improving the methods used by the Navy in the prosecution of operations and in the supply of men and materials.

2. All persons in the naval service or employed by the Navy Department who consider that they have sufficient first-hand information to make suggestions of value are requested to submit, before April 1, 1920, a statement, in duplicate, to the Secretary of the Navy describing briefly any method or practice which is considered subject to improvement and giving a concise recommendation for the remedy of this condition.

3. Recommendations on one or more of the following subjects are desired:

1. Organization of—

- (a) Navy Department.
- (b) Forces afloat.
- (c) Fleets.
- (d) Forces.
- (e) Battleship and destroyer squadrons.
- (f) Destroyer and submarine flotillas.
- (g) Battleship, destroyer, and submarine divisions.
- (h) Task forces.
- (i) Ships.
- (j) Shore establishments.

1. Organization of—Continued.
 - (k) Naval districts.
 - (l) Bases.
 - (m) Navy yards.
2. War plans of the Navy Department and commanders of fleets and forces:
 - (a) Operations of forces afloat.
 - (b) Maintenance and operation of shore establishments necessary to permit the forces afloat to carry out their mission.
3. The system of command used and the form of orders issued by the Navy Department and subordinate commanders.
4. The means taken to obtain information of the enemy and to disseminate it to our own forces.
5. The means taken to obtain information showing the exact situation of our own forces and the personnel and the material available for them.
6. The means taken to coordinate the operating forces with the bureaus and offices supplying them with personnel and material.
7. The cooperation of the bureaus and offices charged with the supply of material with civilian business men and manufacturers.
8. The escort of convoys subject to attack of surface craft.
9. The escort of convoys subject to submarine attack.
10. The organization of convoys.
11. The organization of a transport.
12. Taking over, fitting out, and equipping merchant vessels and returning them when no longer required for naval purposes.
13. Operations against submarines by—
 - (a) Destroyers.
 - (b) Submarines.
 - (c) Aircraft.
 - (d) Vessels equipped with listening devices.
 - (e) Armed merchant vessels.
 - (f) Other classes of vessels.
14. Mining operations against submarines and surface craft.
15. Fleet tactics.
16. Gunnery.
17. Torpedo tactics.
18. Scouting and patrolling for enemy surface craft.
19. Communications, including signaling and signal books.
20. Obtaining adequate personnel:
 - (a) Enlistments and training of naval personnel.
 - (b) Recruiting and making available the civil personnel necessary for the supply of special material and the maintenance of the fleet.
21. Methods of raising the morale and increasing the contentment of the personnel.
 - (a) Naval personnel.
 - (b) Civil personnel.
22. Discipline, rewards, and punishments.
23. Uniform and clothing.
24. Food.
25. Mail and censorship.
26. Development of ordnance material.
27. Development of engineering material.
28. Development of construction and repair material.
29. The purchase of supplies and making of contracts.
30. The transportation of supplies.
31. The settlement of claims.
32. Development of medical supplies.
33. Sanitary arrangements on ship and ashore.
34. Treatment of sick and wounded.
35. Cooperation with inventors.
36. The preparation of diaries, records, and reports.
37. Cooperation of the Navy Department with other Government agencies.
38. Cooperation of the Navy Department with the Allies, in connection both with the operation of the naval forces and with material matters.
39. Miscellaneous subjects.
40. A separate page should be used for each subject. Recommendations are not limited to those listed above, but should be made on all other important subjects of which the writer has first-hand knowledge.

JOSEPHUS DANIELS,
Secretary of the Navy.

ALL OFFICERS ASKED EARLY IN THE WAR TO SUGGEST PLANS TO WIN VICTORY.

You have heard the views of a few naval officers who have appeared before your committee, and though particularly as to the criticisms of trivial matters by those who were called because they were known to have made recommendations which were not adopted by the Navy Department, you must have been struck with the truth that naval officers are not always in agreement upon policies, or ships or personnel. Indeed, if all who disagreed had been called at one time you would have had a debating society. The adverse witnesses were in agreement only on one point; and that was that the department greatly erred every time it did not unquestioningly follow the particular plan the particular officer was cocksure was the only plan to win the war.

It may not be known to the members of this committee and to Congress that the department from the first recognized that the war upon which it had entered was unlike any other war, and that its end could be hastened only by discovering and adopting new and more audacious methods than the allied powers had employed up to the time the United States entered the war.

As evidence of the desire of the department to enlist the thought and initiative and advice of all the officers of the service for bold methods, the following "All-Navy telegram" was sent on the 2d day of August, 1917, for every officer in the Navy:

August 2, 1917.

Radicode: To all officers of the United States Navy. Confidential. In order that nothing may be left undone by the American Navy to win the war, the cooperation in initiative and suggestion of every officer of the Navy is earnestly desired. Request is hereby made that all officers who are giving study and thought to this important matter to submit their views and plans to the Chief of Naval Operations.

Well-considered suggestions from officers of all grades will receive immediate consideration, and officers presenting plans that give promise of helping to secure victory will be ordered to Washington for consultation.

Victory may wait upon students and strategists in the American Navy.

This request is made of all officers, young and old alike, and all are urged to forward without delay the result of their studies direct to the department.

JOSEPHUS DANIELS,
Secretary of the Navy.

In answer to that request replies were received from 251 officers. Their suggestions were referred to the General Board for consideration and recommendation. I feel quite sure that if your committee had called each one of these 251 officers before you, every one of them would have told you, and have been perfectly honest about it, that the plan he proposed had about it such merit that, if it had been promptly carried out, it would have contributed greatly to win victory, and that the department was wanting in wisdom when it did not adopt his particular suggestion. Most of these officers, however, have no grievance or disappointment or excess of vanity. Few of them would charge that failure to follow their particular recommendation cost the lives of 500,000 men or \$15,000,000,000, for they are mainly officers not given to hyperbole, and they have no desire to help to prove that, while allied navies did great things, the American Navy was inefficient, and the department lacked the desire or the capacity to work whole-heartedly to win victory. I will append

herewith or read, whichever pleases the committee, those 251 suggestions in response to my request. They make just as important a part of this post-mortem to discover which plan suggested was not adopted, and therefore was responsible for not hastening victory as the views of officers who have come before you and told of how not adopting their advice delayed or hampered the glorious victory which brought lasting honor to the Navy, in spite of any lack of omniscience on the part of any officer of the Navy Department. I will give them to the committee.

The CHAIRMAN. You will give what to the committee?

Secretary DANIELS. The replies of these officers as to the best methods of winning the war.

The CHAIRMAN. You mean the 251 suggestions?

Secretary DANIELS. Yes.

The CHAIRMAN. For the records?

Secretary DANIELS. Of course. Each man gave his opinion. Some men who gave their recommendations which were not adopted have been before you and stated them. In order to know what was proposed and to know whether any of them were wise, these might very well go in.

Senator KEYES. These recommendations were made in writing?

Secretary DANIELS. Yes. Of course, many of them were made personally, but only in writing.

THE MAGNITUDE OF THE NAVY'S TASK.

The Navy under this administration has built and manned more ships than in all the periods of 126 years since the Navy Department was established in 1794.

The Navy under this administration has enlisted and trained more men than in all the preceding years of naval history in the United States.

The Navy under this administration has secured appropriations which amount to \$2,688,080,466.59, a billion and eight hundred thousand dollars more than the total expenditures of the Navy during all the years since 1794.

One of the new dreadnaughts, like the *New Mexico*, which was finished during the war, is equal in gun power to all Farragut's fleet which bottled up the southern ports.

The following ships composed the fleet of Admiral Farragut:

The steam sloops *Hartford*, *Pensacola*, *Colorado*, *Brooklyn*, *Portsmouth*, *Oneida*, *Mississippi*, *Varuna*, *Iroquois*, *Richmond*, *Lackawanna*, *Monongahela*, *Ossipee*, and *Seminole*.

The monitors *Chickasaw*, *Manhattan*, and *Tecumseh*.

The Coast Survey steamer *Sachem*.

The steamers *Sciota*, *Katahdin*, *Winona*, *Itasca*, *Cayuga*, *Pinola*, *Wissahickon*, *Kennebec*, *Harriet Lane*, *Westfield*, *Miami*, *J. T. Jackson*, *Clifton*, *Pambina*, *Cowslip*, *Stockdale*, *Buckthorn*, *Genesee*, *Glasgow*, *Estrella*, *Narcissus*, *Galena*, *Conemaugh*, *Port Royal*, *Mittacomet*, *Octorora*, and *Sebago*.

The bark *Houghton*.

The ironclad *Winnebago*.

The mortar schooners *Norfolk Packet*, *A. T. Ward*, *Horace Beall*, *Henry James*, *William Bacon*, *Seaform*, *Para*, *George Mangham*,

Sarah Bruen, Racer, O. H. Lee, Ben Smith, Adolph Hugel, Maria J. Cordon, Signey C. Jones, Sophronia, Matthew Vassar, C. P. Williams, Griffith, and Orvetta.

It will be interesting and illuminating to contrast the number of ships, with their displacements and their cost, in the World War, as compared with those in the War of 1812, the Mexican War, the War of 1865, and the Spanish-American War. The number of ships in all previous wars was 1,271, as compared with 360 which we had on April 1, 1917, but this number had been increased by 2,834 ships on November 1, 1918, thus making the total number of ships that we had in the World War 3,194.

The displacement of all ships in all previous wars was 1,217,000 tons, as compared with a displacement of 1,490,000 on April 1, 1917, and this displacement was increased by 8,176,000 tons to November 1, 1918, making a total displacement of all ships that we had in the World War 9,666,000 tons.

The estimated total cost of all ships in all previous wars was \$288,000,000, as compared with the estimated total cost of all ships we had on April 1, 1917, \$422,000,000. This estimated total cost of ships constructed from that date to November 1, 1918, was \$2,222,000,000, thus making a total cost of all ships that we had in the World War \$2,644,000,000.

The Navy expanded from 47,357 men on March 5, 1913, when I became Secretary of the Navy, to 530,000 on November 11, 1918, and the Marine Corps increased from 9,893 on March 5, 1913, to 72,963 on November 11, 1918.

To be sure the great expansion in 1917-18 was due to the World War, but before we entered the war we had secured an authorized strength, in case of emergency, to 97,000 men and secured authorization for more ships than in eight years prior to this administration, and the appropriations were in the five years before we entered the war \$1,265,823,617 more than in the preceding eight years under Roosevelt and Taft.

The stupendous appropriations for war purposes tell the size of the job, certainly as far as it relates to administration, the securing of ships, munitions, and supplies, better than could be told in words. The expenditure of more than \$4,000,000,000 by the naval administration—more in something over 2 years than in the previous 124 years—without the suggestion or intimation of a dollar of expenditures being improper, dishonest, or touched by graft, could not be recorded without the fact carrying with it tribute to the efficiency of the organization of the Navy Department, the sound judgment of the responsible administrators and the perfect team work which characterized the Navy Department and all naval agencies engaged in the gigantic task committed to it.

Without going into the naval expenditures of the naval participation in the War of 1812 or the War with Mexico in the forties, it may be interesting to give the amounts appropriated for the Navy in our three greatest wars—the war from 1861 to 1865, the war with Spain in 1898, and the World War of 1917-18. Here are the figures:

The Civil War.....	\$466, 715, 116. 99
Spanish-American War.....	182, 915, 293. 00
The World War.....	4, 290, 945, 799. 48

When one contemplates these vast sums which were required to do the big job intrusted to the Navy and the necessity of its expenditure in so short a time under the whip and spur of war, the reflection of Americans must be one of pride that the big task was performed so well.

I confess that as I look back upon the strenuous days of those critical times my admiration for the men with whom I was privileged to associate is heightened. We enrolled and trained the men, we built and chartered the ships, we built the guns and the munitions and the mines, we carried on a business embracing everything from laying a barrage costing \$79,476,534.31 across the North Sea to feeding, clothing, and equipping over 600,000 sailors and Marines with such expedition and so little delay as to win the commendation of every captain of industry who touched the Navy Department at any angle while it was performing its task. There was no friction, no lost motion, no failure anywhere. The Navy lived up to its motto: "They say it can't be done. We have done it."

I do not pretend, of course, that there were no errors of judgment or that the Navy was always 100 per cent efficient, though the Chief of the Bureau of Supplies and Accounts holds that its lowest figure of perfection was 99½. During the days of strain there was never a moment when, working from early morning till late into the night, any responsible administrator did not go to bed regretting that the day was not long enough to do more. Looking back upon the enforced speed of the performance, it is remarkable how few and small were the errors or mistakes. They were made, of course, but never was there any spirit except to break the speed limit in hurrying every ounce of naval power into the struggle.

And nobody in America suggested that the Navy had lacked in doing a great work in a great way until nearly over a year had elapsed since the Navy brought back the hundreds of thousands of soldiers it had safeguarded to France. It took months to find any imagination vivid enough to suggest lack of success and efficiency. And though many thousands of words have been droned out before your committee, nothing has yet been established that takes away the just pride of the American people in their Navy during the World War.

It is a matter of interest to note the appropriations for the Navy made by Congress from its establishment in 1794, when they had \$768,000, up to 1913, when they had \$130,000,000. In other words, up to the 4th of March, 1913, the appropriations are \$3,000,000,000.

Since the 4th of March, 1913, the appropriations amount to \$5,000,000,000, making a total for the 120 years of \$8,962,000,000. I have a statement here in the form of a table showing the appropriations and the expense of the war.

(The table referred to is here printed in the record, as follows:)

Statement showing the appropriations for the Navy year by year during the period from 1794 to 1919, inclusive.

Fiscal year:		Fiscal year—Continued.	
1794.....	\$768, 888. 82	1800.....	\$2, 482, 953. 49

The CHAIRMAN. I think this will be a good place to adjourn, Mr. Secretary, until to-morrow morning.

Secretary DANIELS. Very well, Mr. Chairman.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Thursday, May 13, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

THURSDAY, MAY 13, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. I have here a letter from Admiral McKean, concerning the request made by the committee to him, that a copy of the Black plan be given the committee, and explaining his reasons for not producing the plan. I will ask that this letter be inserted in the record.

(The letter referred to is here printed in the record as follows:)

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, May 8, 1920.

MY DEAR SENATOR: In the hearings of April 30 the Navy Department's General Board's basic plan known as the Black plan was referred to, and you requested a copy of this plan be furnished this committee for record.

After consultation with the Secretary of the Navy I regret to inform you that in view of the confidential nature of this plan, the Navy Department does not think it should be submitted to the committee, or any part of it placed on the records.

You will understand the department's point of view. I am sure, when I explain that as the strategy of the Black plan was based on the Atlantic Ocean, it was necessarily similar in trend of thought and strategic design to any other or all other plans covering the same strategic area, and that should this plan or any part of it come into the hands of any other powers who might in the future get to be our enemy, it would give them an immense advantage to know our strategic methods and our line of strategic thought.

Admiral Badger, chairman of the General Board, is in agreement with the Secretary as to the inadvisability of this plan or any part of it being permitted to become public, or that we would be justified in running the risk of any part of it becoming public.

Very truly, yours,

J. S. McKEAN,
Rear Admiral, United States Navy.

Hon. FREDERICK HALE,
Chairman Naval Subcommittee of Investigations, United States Senate,
Washington, D. C.

The CHAIRMAN. A short time ago I received a letter from Rear Admiral Victor Blue, retired, which reads as follows. [Reading:]

FORT GEORGE, FLA., May 2, 1920.

Hon. FREDERICK HALE, United States Senator,
Chairman of committee investigating the Navy Department.

MY DEAR SENATOR: The New York Times of April 29 alleges that Rear Admiral McKean in his testimony before your committee states that an error made by me in 1915 in estimating the necessary complements of the ships was mainly responsible for the shortage of enlisted personnel.

I desire to make a most emphatic protest against any such implication by Admiral McKean, and request that your committee will kindly permit me to submit a written statement in reply thereto.

In order that I may have exact information in regard to Admiral McKean's testimony, it is requested that an official copy of same be forwarded to me at the address indicated above.

If not for my serious ill health, I would ask the privilege of appearing before your committee in person.

Very respectfully,

VICTOR BLUE,
Rear Admiral, United States Navy (retired).

I have also received another letter from him, dated May 8, in which he explains the matter and asks that his letter be included in the record. I have shown this letter to Senator Pittman, and he has no objection; and without further objection this letter of May 8, as well as the letter of May 2, will be inserted in the record.

The second letter is as follows:

FORT GEORGE, FLA., May 8, 1920.

HON. FREDERICK HALE,

Chairman of committee investigating the Navy Department's conduct of the war.

MY DEAR SENATOR: On the 2d instant I addressed a letter to you protesting against certain statements of Rear Admiral McKean, as alleged by the public press to have been made before your committee to the effect that errors made by me in estimating the number of men for the ships in 1915 were mainly responsible for the shortage of enlisted personnel, and that these errors were due to the fact that I took the number of ships listed in the General Board's plans and estimated the total number of men on the basis of "peace complements." In that letter I requested that an official copy of Admiral McKean's testimony be sent me, in order to permit of an intelligent reply to the same.

Not having received such copy, and believing that your committee is now nearing the end of its labors, I am constrained to submit this statement, and beg that it may be considered by your committee and placed in the record.

I am greatly surprised that an officer who served so long in the Navy Department, and who was so fully cognizant of its inside working, as was Admiral McKean, should make such a statement in regard to my actions while Chief of Bureau of Navigation.

In the estimates referred to the figures used were those with which the ships had operated from the very beginning of their existence, extending back many years before I was ever thought of for chief of bureau. To my mind there was no question of a "peace" and a "war complement" per se in the case of ships in full commission, except that always in time of war a large number of supernumeraries are usually kept on board for the purpose of being at hand to fill vacancies immediately as they occur. As a matter of fact, I always tried to impress this view of the matter upon Members of Congress. My predecessors in the Bureau of Navigation had established the complement of the ships when they were built, and these complements had stood the tests of actual service. They compared favorably with the complement of ships of the British Navy of similar types. They were made out in accordance with a fixed rule established by the department for many years, yet one would infer from Admiral McKean's alleged testimony that they were evolved from my brain.

It had been the custom for many years for the Bureau of Navigation to fix arbitrarily the complements of the ships. I believe that I was the first chief of bureau who ever attempted to revise these complements by reference to boards of officers appointed by the commander in chief of the fleet. Unfortunately, however, the reports of these boards differed so widely in cases of certain battleships of the same type that full confidence could not be placed in them. The controversy which arose over these reports, being sent to the House Naval Committee by persons unknown for use as propaganda, befogged the issue and led to a general belief that I was opposed to an increase of enlisted personnel.

This idea was preposterous, as subsequent events proved—notably the passage of legislation in 1916 which increased the enlisted strength to practically 100,000 men. This total included 76,700 fighting men, in addition to the Medical Corps and some others, which number the President could increase to 87,000, making 100,000 in all. For this legislation I had labored for many months, and was finally successful in that my recommendation was enacted into law without a single figure being changed by Congress. This large increase was made from an enlisted strength of some 54,000 men.

It so far exceeded the recommendations of the General Board and of other high-ranking officers that everyone experienced great surprise.

I wish to say in this connection that it was not my custom to make recommendations to committees of Congress on matters involving policy that did not meet the approval of the administration. If, as was sometimes the case, such approval was a long time in coming, I bore the burden in silence without explanation of the reasons to the service.

Any other course on my part would have been disloyal to my civilian chief, who was responsible to the people for his administration of the Navy and the establishment of its policies, as well as a source of danger to the Nation.

Recent European history amply demonstrates how a Government can be destroyed and a whole nation debauched by the arrogance of the military in assuming to itself to decide upon state policies.

During my hearings before the House Naval Committee, which considered the "estimates" to which Admiral McKean referred, I explicitly stated in effect that they were only "estimates" based on certain conditions that governed, and were not to be taken as recommendations from me.

I am all the more surprised at Admiral McKean's statement for the reason that he was in the department and presumably cognizant of my activities towards securing legislation for the Navy that would place it on a firm basis and raise it to the highest degree of efficiency. To what extent I was successful in my efforts is shown by the amount of personnel legislation urged by me, and enacted into law during my regime as Chief of Bureau.

Among the principal items of such legislation were the following:

(a) The provision creating a Chief of Naval Operations in the Navy Department organization.

(b) The provision for admirals and vice admirals in the organization of the fleet.

(c) The reorganization and increase of the officer personnel of the Navy, basing the total number of officers on a percentage of the enlisted strength, and distributing the number of officers throughout the various grades in order to insure an automatic and healthy flow of promotion.

(d) The creation of the Naval Reserve Force. This measure not only created a Naval Reserve Force, but it also contained excellent provisions for the regular enlisted force, by offering great inducements for long service of the men, and for reclaiming to the regular service or to the reserve the many thousands of well-trained ex-service men in civil life, as well as increasing the morale by placing a high premium upon honorable service.

(e) The provision increasing the enlisted strength from about 54,000 to practically 100,000 men.

There were many other measures of minor importance that were initiated and urged by me until enacted into law.

All these measures were passed as provisions of appropriation bills, and therefore were subject to a point of order.

It was amusing to read the statement of a high ranking officer to the effect that he had recommended the creation of a Chief of Naval Operations, and that his recommendation was adopted, notwithstanding the opposition of the Secretary of the Navy and of the majority of the Naval Committee. That would, indeed, seem strange, when it is known that the opposition of only one Member of Congress was required to defeat it.

The position in which Admiral McKean has placed me makes it necessary for me to bring to light matters in regard to personnel legislation which would seem to exploit myself. This, however, is far from my desire or intention. Regardless of what others did, I worked hard to have the office of Chief of Naval Operations authorized, giving it the maximum power possible under the Secretary of the Navy. It was I, against much opposition, who insisted on having it written into law that the Chief of Naval Operations would be in succession to act as Secretary of the Navy next to the Assistant Secretary, although I, as Chief of Bureau of Navigation at the time had that prerogative.

When the law went into effect, I subordinated myself and my bureau to the Chief of Naval Operations as an example to the other bureaus to regard him as their military chief—all this that the Navy might be better organized for war.

As for the other items of legislation mentioned herein, I not only initiated them, but urged them continually, until they were finally enacted into law. Some of these required months, and others years. As your committee well knows, it is one thing to recommend legislation and another thing to get it through.

The provision reorganizing the officer personnel on a percentage basis of the enlisted force with a percentage of distribution in the various grades was proposed and drafted by me personally. Many months of effort were expended in collecting data about foreign navies, making tables of same, and producing arguments for convincing the department and Members of Congress of the advantages of this legislation.

Same may be said of the provisions creating the Naval Reserve Force. This was also entirely my own. It was evolved from lengthy studies of foreign systems and from a large mass of correspondence with many persons throughout the country. More than two years were taken up in efforts to get this legislation through. It provided for enrolling and training an unlimited number of officers and men for war service.

And again, the increase in the enlisted force (regular) from about 54,000 to practically 100,000 required many months of effort on my part in collecting data and writing arguments to show the necessity for the increase, etc.

When I first took over the duties of the bureau, I found the Navy woefully short of officers and did everything possible to increase the output of the Naval Academy and to provide for commissioning deserving enlisted men as well as civilians. The history of legislation affecting these matters that passed during my incumbency of the bureau amply shows that my efforts in this regard were at least fairly successful.

It must be remembered that all my work in connection with the above-mentioned legislation was in addition to the regular routine work of the bureau.

The fact of the physical breakdown which I have undergone, and which cut short my active career in the Navy, is directly traceable to the burden of overwork performed in connection with the above-mentioned matters.

Before closing I wish to say that all the legislation mentioned above was approved by Secretary Daniels before being sent to a committee of Congress. I wish to say in conclusion that all statements made herein are matters of record in the department and in the Naval Committees, and as such are susceptible of proof, if not actually recorded, they come within the knowledge of officials and naval officers now in Washington or close at hand. In this connection I refer to Senator Swanson and Senator Lodge, of the Senate Naval Committee, and to Mr. Padgett and Mr. Butler, of the House Naval Committee. All of these gentlemen were indefatigable in their efforts to make the Navy 100 per cent efficient, and it is a pleasure to know that I was privileged to work with them. The Secretary of the Navy has first-hand knowledge of all my efforts in behalf of the Navy.

Admiral Benson knows about my activities in regard to the office of Chief of Naval Operations.

Capt. Ridley McLean, who was Judge Advocate General at the time and who translated proposed legislation into legal phraseology, knows about my efforts in that regard, especially as to the legislation creating the Naval Reserve Force and that reorganizing the personnel of the Navy.

Capt. D. W. Wartsbaugh, who was in charge of the enlisted personnel division of the bureau at the time in question, knows how the "estimates" referred to by Admiral McKean were made.

The statements made herein are from memory entirely, as I have no records at hand to refer to, but my memory can hardly be at fault in matters which engrossed my attention for so many months and even years. I remained in the bureau a year and several months longer than I at first intended, for the express purpose of assisting in the preparation of the Navy for war by furthering the legislation that finally passed in August, 1916. It was my original intention to go to sea in the spring of 1915, but when that time came around without the legislation that I had been hoping for and working for, I concluded to remain in the bureau and continue my efforts until such legislation was assured.

Very sincerely,

VICTOR BLUE,

Rear Admiral United States Navy (retired.)

Will you proceed, Secretary Daniels?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. There never was a moment from the time that I told Admiral Sims in the Navy Department on the day he was intrusted with the confidential mission to London, that the President believed shipping should be protected under convoy, when my individual opinion was not favorable to the plan of convoy. But neither in that nor in any other purely naval operation or distribution of our ships did I impose my individual opinion upon the responsible military officers. I knew that up to July the British

were not fully operating the convoy system, though successful trips had been made from Gibraltar and other places.

I knew that there was a difference of opinion among naval officers on the convoy question, particularly under the conditions existing as to destroyers and other escort craft. I knew that some of our ablest officers agreed with the three-year doctrine of the British Admiralty, that a well-armed ship had a better chance by going alone than in convoy. I knew the armed guard had been successful to a high degree. Though in harmony with the view frequently expressed by the President, that the convoy system would prove an additional protection, I did not undertake to impose such view upon the Office of Operations, which was responsible for the formulation and carrying out of the operations of our ships. I had full faith in the ability and judgment of the head of that office and his subordinates. This was justified because, though having agreed at first with the British Admiralty, that the policy of dispersion was preferable, it was ready to adopt the convoy system when it was practicable, and furnished all possible ships to make it a success. All American troops from the very first, going to France, went in convoy.

Knowing exactly my opinion at the time on the question of convoys, it may be imagined that it was with a good deal of surprise I read the telegram produced by Admiral Sims on the 10th day of March in his opening statement before this committee, which he declared and emphasized time and again had been sent by me, it being apparent that he was attempting to produce the impression that I was personally in opposition to the convoy system. The dispatch he presented was as follows:

Received: June 20, 1917 via Admiralty.
To: Commander in chief, Queenstown.

Following for Admiral Sims:

Begins. There will be no additional movement before August of troops. You will be furnished fully with information as to sailing of Army supply ships as far as possible in advance and the actual sailing and intended route and probable dates of arrival will be reported. We hope to sail four Army supply ships now fitting out in about 10 days' time. The 32 destroyers which are all that there are available have sailed. One hundred and ten-foot chasers which are to be sent to France should begin to deliver in August. Fishing vessels, 12 in number, will sail in August for France. There are no other small craft available at present although work on yachts is being pushed; probably ready 15th July. In regard to convoy, I consider that American vessels having armed guards are safer when sailing independently.

DANIELS.

In his testimony Admiral Sims added:

I would like to invite particular attention to that last paragraph:

"In regard to convoy, I consider that American vessels having armed guards are safer when sailing independently."
And that was signed "Daniels."

Well, I can assure you that I was about ready to jump overboard when I got that last message. After all the information that had been sent out, as to the nature of the antisubmarine campaign and as to the nature of the submarine campaign, to be informed officially by the Navy Department, "In regard to convoy I consider that American vessels having armed guards are safer when sailing independently."

The statement "and that was signed 'Daniels,'" is untrue. No such telegram "signed 'Daniels'" was ever sent to Admiral Sims. In his testimony he iterated and reiterated several times that this dispatch which made him "about ready to jump overboard" was "signed 'Daniels,'" and conveyed the impression that the civilian

Secretary of the Navy had personally passed upon the question of a particular method to be adopted to protect shipping, and was "resisting the adoption of the convoy system." I knew I never entertained the opinion stated in the dispatch he displayed. I knew I had never sent such a telegram. I knew that if my name appeared upon such a telegram it would be because somebody had forged my name to it. Therefore, as soon as I learned that Admiral Sims had produced the telegram "signed 'Daniels,'" I gave directions to see if such a telegram had been sent by me to Admiral Sims at any time. The answer was that there was a copy of the telegram in the files of the department, but the copy was not "signed 'Daniels.'" The dispatch had been sent to London through the British Embassy, which had retained the original copy. I then sent an officer to the British Embassy for the original copy, which I now present to your committee. [Handing paper to the chairman.]

This is the original of the telegram obtained from the British Embassy, furnished for transmission by the naval aid to the Chief of Naval Operations, together with his note to Commodore Gaunt. [Reading:]

NAVY DEPARTMENT,
OFFICE OF NAVAL OPERATIONS,
Washington, June 18, 1917.

Memorandum for Commodore Gaunt.

Admiral Benson requests that you send the following message to Vice Admiral Sims: "No additional movement of troops before August. Information of sailing of Army supply ships will be furnished as far in advance as possible and actual sailings, probable dates of arrival and intended route reported. Four Army supply ships now fitting out to sail in about 10 days.

"All available destroyers totaling 32 have sailed; 110-foot chasers are to be sent to France as fast as possible, beginning in August. Twelve fishing vessels will sail for France in August. No other craft available at present although work on yachts is being pushed, probably ready by July 15.

"Regarding convoy I consider that American vessels with armed guards on board are safer when sailing independently.

"By direction of Chief of Naval Operations.

"A. F. CARTER."

This shows that somewhere somebody was guilty of signing my name to an official dispatch which the original here produced shows I never signed, or of altering a dispatch by erasing the real signature and substituting "Daniels." You can imagine my indignation when this false signature was spread broadcast over the country in the sensational press stories of the hearings, and the country was told that I had signed a telegram which made Admiral Sims "about ready to jump overboard." The perpetrator of this attempt to fix upon the civilian Secretary of the Navy a telegram signed by another official, ought to be produced by Admiral Sims, who produced the altered telegram, and who owes an apology to me and to the country for the impression undertaken to be made by his testimony based upon a false signature.

I gladly and freely take responsibility for every policy and act of the Navy and Navy Department, whether originating with me or my responsible subordinates, and if Admiral Sims had printed the telegram with its true signature, I would have said to your committee, as follows:

"In the matter of operation and disposition of ships, the Office of Operations was given full responsibility during the war. Its activ-

ities were directed by able and patriotic men of long experience, and the dispatch expressed the opinion of a great officer. I gave the Chief of Operations authority to act independently upon these matters, and had such confidence in his judgment that he was given a perfectly free hand. He believed at the time he sent that telegram that 'American vessels having armed guards are safer when sailing independently.' He conveyed that opinion to Admiral Sims for his information, but he gave no orders against the convoy and did not close his mind. Our Chief of Operations, open-minded and ready to change his views when such a change had been shown advisable, was happy to accept the result of the successful convoy experiments and to furnish ships that made possible much of the success attendant upon the adoption of the system. He was justified in his faith in the good results of the armed guard. He was justified in his policy adopted from the first of conveying every ship carrying American troops. He was justified in furnishing ships when convinced that the convoy should be added to the other methods of protecting ships from the submarine and the amount of convoy work done by the American forces under the direction of the Chief of Naval Operations, compares most favorably with the convoy work of any one of the Allies, or all of them put together for that matter."

That is the statement about the position of Admiral Benson, which all fair-minded men will say demonstrates his ability and capacity. It was because he was open-minded to suggestions and ready to adopt new plans when they promised greater success than the old ones that he made the administration of the Office of Operations during the World War worthy of the commendation and approval it has received from Americans and allied nations. This approval has been particularly worthy of mention from naval officers and Army officer at home and abroad.

The question whether the Chief of Operations of the United States Navy was convinced a few weeks earlier or a few weeks later regarding a debatable question concerning which it took practically three years to convince the British Admiralty, does not seem a serious one when we consider that after all the convoy system was put into effect quite as rapidly by the United States Navy as by the British Navy. It was not a system which could be applied instantly, and it was months before it was working with thorough smoothness. It is, however, for the purposes of your committee, a very material question whether it is furnished with facts or fiction, and I submit that nothing excuses or justifies the presentation of a telegram, no matter what its contents, "signed Daniels," which was not "signed Daniels."

I wish to have the copy of the original placed in the record, with Mr. Carter's signature, showing that this telegram had my name forged to it.

The CHAIRMAN. Very well. Are you going to leave the original with us?

Secretary DANIELS. The original belongs in the files of the British embassy. At that time, at the request of Admiral Sims, we were sending telegrams of importance through the British embassy and the Admiralty in London, to Sims. That is a part of their files. I have here a photostat copy of it, and I will leave that with you.

Senator PITTMAN. Is that a photostat copy you have there, for the record?

Secretary DANIELS. Yes, sir.

The CHAIRMAN. I think it would be well for you to leave with us also the original. Will you keep the original yourself, so that we can have it, if necessary?

Secretary DANIELS. Yes; I will.

The CHAIRMAN. Very well.

Secretary DANIELS. I come now to the matter of troop transportation.

TROOP TRANSPORTATION.

Sims warned that first duty of our destroyers was to protect troopships. Ordered destroyers to Queenstown, leaving transports without escort.

Carrying to Europe and bringing home the 2,000,000 troops of the American Expeditionary Force has been justly termed "the biggest transportation job in history." They had to be transported 3,000 miles through submarine-infested seas, facing the constant menace of attack by an unseen foe, as well as the perils of war-time navigation. Yet not one American troopship was sunk on the way to France, and not one soldier aboard a troopship manned by the United States Navy lost his life through enemy action.

That achievement had never been equaled. It was not only the most important, but the most successful operation of the war. The Germans never believed it could be done. When they broke all their solemn pledges and declared ruthless submarine warfare, sinking neutral as well as belligerent vessels without warning, they realized full well that they were waging war against the United States. But the Prussian war lords and general staff never believed America could raise and train an army of millions, and Von Tirpitz and his crew assured the German people that, even if such an army was created, it could never be transported to France. The sinking of transports would have been the most telling blow the Germans could have dealt the Allies, the greatest victory of their submarine warfare.

That they failed to sink a single loaded United States troopship and sank only three ships of other nationalities carrying American troops was not due to any lack of intention or effort, but to the fact that we gave our troopships such efficient protection that it was almost impossible for the U-boats to sink them.

There is not an American soldier, not a mother or father who sent a son to France, who is not grateful to the Navy for throwing around those ships every safeguard for landing safely in France and bringing home every soldier intrusted to its care.

The Navy Department from the moment it was intrusted with this task regarded the protection and successful operation of these troopships as its highest duty. Regarding human life as more valuable than supplies, I did not share the view of Admiral Sims that the escorting of cargo ships was quite as important as the protection of vessels carrying troops. In the medal awards hearing before this committee Admiral Sims gave you some idea of his views on this subject when he contended that even if the Germans had sunk some of our troopships and killed 15,000 or 20,000 troops "they would thereby have lost the war because the war depended upon getting the supplies in." Admiral Sims added:

Twenty thousand troops lost there would not have been any more serious than 20,000 lost on the battle front. It sounds a little heartless to say so, but from the military point of view it would have been relatively of less importance.

(Reproduction of a photostatic copy of the communication above referred to printed herewith.)

In reply refer to No.

Op-22-B

NAVY DEPARTMENT
OFFICE OF NAVAL OPERATIONS
WASHINGTON

18 June, 1917.

MEMORANDUM FOR THEODORE GAUNT.

Admiral Benson requests that you send the following message in code to Vice Admiral Sims:

"No additional movement of troops before August. Information of sailing of Army supply ships will be furnished as far in advance as possible and actual sailings, probable dates of arrival and intended route reported. Four Army supply ships now fitting out to sail in about ten days.

All available destroyers totaling 32 have sailed. 110 foot chasers are to be sent to France as fast as possible beginning in August. Twelve fishing vessels will sail for France in August. No other craft available at present although work on yachts is being pushed probably ready by July 15th.

Regarding convoy I consider that American vessels with armed guards on board are safer when sailing independently.

Opnav."

By direction of Chief of Naval Operations.

174273. (To face page 2114.)

W

Think of it, gentlemen, relatively of less importance to have lost 20,000 men than to have lost some cargo ships carrying supplies.

Senator PITTMAN. Will you pardon me, just a minute, there, Mr. Secretary. The other day, in cross-examining Admiral Benson, I had occasion to ask the admiral if he concurred in the opinion of Admiral Sims in regard to the relative importance of protecting troopships and cargo-carrying ships. I referred then to my memory of certain testimony of Admiral Sims. This is undoubtedly a part of the testimony that I had in mind that you have just read, although it was again referred to before this committee in this hearing. I just call attention to that.

The CHAIRMAN. And the testimony was put in the record at that time at that point. Admiral Sims's written testimony was put in by you the other day, at your suggestion, covering this matter.

Senator PITTMAN. I have not seen what was put in. As I recall, I was to put it in.

The CHAIRMAN. Was it not put in?

Senator PITTMAN. No; it has not been put in, because I was looking it up, and intended to put it in, which I will do. That is the reason that I call attention to it now. What I will do is, as soon as I gather it together, I will put it in in permanent form.

The CHAIRMAN. Very well.

Secretary DANIELS. This frank expression of Admiral Sims's view throws light on some of his actions during the war which, at the time, were difficult for me to understand. I found it necessary, soon after troop transportation began, to remind him sharply that the first duty of American destroyers in European waters was to protect ships carrying American troops. But I could not conceive that an American Admiral, charged with such high responsibility, could regard supplies as of more value than human life, and cargo vessels more important, for any reason, than ships carrying American troops.

WARNED THAT PROTECTION OF TROOPSHIPS WAS PARAMOUNT DUTY.

Admiral Sims's course regarding the protection of ships carrying troops caused such anxiety in the department that, on July 28, 1917, I sent him the following cablegram:

The paramount duty of the destroyers in European waters is principally the proper protection of transports with American troops. Be certain to detail an adequate convoy of destroyers and in making the detail bear in mind that everything is secondary to having a sufficient number to insure protection to American troops.

JOSEPHUS DANIELS.

That was one dispatch I did write with my own hand, and it meant exactly what it said. Admiral Sims in his testimony has tried to disguise its character by a smoke-screen of words, preceding it and following it, and by the statement that he was "completely in accord" with my attitude as set forth in that cablegram. But the fact is that that dispatch was the sharpest reminder that I could send him without making it a severe reprimand.

I would not have sent that peremptory cablegram if it had not been necessary. The protection of our troops transcended every other naval duty. The fathers and mothers who had intrusted their sons to naval protection looked to the Navy to safeguard them to France. I was daily in close touch with the Secretary of War and responsible Army officers, as were also Admiral Benson, Chief of Operations, and Capt. Pratt, Assistant Chief of Operations. We felt deeply our

responsibility. Admiral Sims's course in regard to the first convoy and his later dispatches, like that of July 14, stating that it was "impossible" for him to "guarantee safe escort protection through submarine zone for troops, troop supplies, and valuable Government cargoes"—you observe, gentlemen, whenever he speaks of cargoes, he speaks of "valuable cargoes" and "important cargoes," and whenever he speaks of troops he does not speak of the value of human life—his statement that it was "impossible" for him to "guarantee safe escort protection through submarine zone for troops, troop supplies, and valuable Government cargoes" unless various conditions were fulfilled, caused such grave anxiety that, to remove any doubt whatever about troopships being protected and insure the provision of destroyers as escorts, I sent that cablegram to Sims warning him that he must "be certain to detail an adequate convoy of destroyers," and, in making details, must "bear in mind that everything is secondary to having a sufficient number to insure protection to American troops."

TROOPSHIPS LEFT WITHOUT DESTROYER ESCORT.

When the first troops reached France, Admiral Sims ordered to Queenstown all the destroyers that escorted the convoy, leaving our transports without returning escort. You can imagine my surprise when I received the following cablegram from Admiral Gleaves, commanding the convoy:

PARIS, July 4, 1917.

SECRETARY NAVY,
Washington:

Destroyers which came with convoy to Europe have received orders from Vice Admiral Sims to proceed immediately to Queenstown. One group of convoy is now ready for return to the United States. The departure of the destroyers leaves the transports without protection. Two submarines are now operating off the entrance. I have informed Vice Admiral Sims that the convoy must have an escort of destroyers, but his order was repeated. Under these circumstances I consider it unsafe to permit the transports to leave the port.

I am holding the convoy ships here until further orders from Secretary of Navy. I request that the commander of the United States forces in European waters be ordered to send a division of destroyers to escort the transports through danger zone, so that my orders from the Secretary may be carried out. The French Government can not give sufficient protection.

GLEAVES.

This was transmitted through the naval attaché at Paris, by request of Admiral Gleaves, who was at St. Nazaire.

Admiral Gleaves also sent another message from St. Nazaire, as follows:

Three transports ready to-day; three to-morrow. The remainder except *Momus* will be ready to leave by July 9, 1917, but I have no destroyer escort. All American destroyers were ordered to Queenstown by Admiral Sims. French can not give adequate protection. Must have a division of American destroyers. Upon their arrival transports will sail.

SIMS ORDERED TO FURNISH ADEQUATE DESTROYER ESCORT.

Upon receipt of Admiral Gleaves's dispatches, the following order was sent to Admiral Sims:

NAVAL ATTACHÉ,
American Embassy, London:

(Old) For Vice Admiral Sims, U. S. S. *Melville*. (New) When informed by Rear Admiral Gleaves of date of sailing of troop convoy take steps to furnish it with adequate destroyer escort.

ADMIRAL BENSON.

At the same time the following dispatch was sent to Admiral Gleaves:

NAVAL ATTACHÉ,
American Embassy, London:

(Old) For Rear Admiral Gleaves via Vice Admiral Sims, U. S. S. *Melville*. (New) Make all preparations for sailing of convoy at earliest date. Inform Admiral Sims of proposed date of sailing and request destroyer escort. Expedite date of sailing of convoy 17004.

ADMIRAL BENSON.

At that time, you remember, Mr. Chairman, the getting of the troop ships back quickly was of the very highest importance, and so Admiral Benson says "expedite date of sailing of convoy."

ORDERED DESTROYERS TO QUEENSTOWN OR PORTSMOUTH.

Admiral Sims had peremptorily ordered all the escorting destroyers to Queenstown or Portsmouth for use with merchant shipping, refusing to allow Admiral Gleaves to retain them for outgoing escort of our troopships. Following is a copy of Sims's order:

22361.

Marine Paris a commandant marine Saint-Nazaire, pour Admiral Gleaves.
Admiral Sims,

Commandant Force Navale U. S. European:

Citation:

Vital shipping is being lost through delay in return of destroyers to their operating areas. They must be dispatched immediately and not held for outgoing escort.

Ships of convoy should be escorted clear of coast by French vessels and thence disperse and proceed independently. *Wilkes* proceed immediately Portsmouth; Other destroyers to Queenstown. Fin de citation.

Certifie conforme.

Saint-Nazaire, le 3 Juillet 1917.

Le capitaine de vaisseau, commandant de la marine, E. Cully.

GLEAVES SO SURPRISED HE DOUBTED AUTHENTICITY OF SIMS'S ORDER.

Admiral Gleaves was so surprised by Sims's first order to this effect, which was transmitted to St. Nazaire by telephone, that he doubted its authenticity. He sent a radio message to Admiral Sims in cipher requesting that the message be confirmed in code, and, further, telephoned to Lieut. Commander Sayles, attaché in Paris, requesting him to trace the message from Paris. Admiral Sims was informed that all our ships must have destroyer escort. But his order was reiterated, and the destroyers left for Queenstown and Portsmouth.

Following is a copy of Admiral Gleaves's memorandum regarding this order:

ST. NAZAIRE, FRANCE, *July 3, 1917.*

Memorandum for senior officer present.

The following communication has been received from Vice Admiral Sims. In view of the fact that this communication came by telephone, the convoy commander is of the opinion that a reasonable doubt exists regarding its authenticity.

"Admiral Sims donne l'ordre de renvoyer immédiatement le destroyer *Wilkes* a Portsmouth. Le lui signaler au besoin par T. S. F. En outre, les destroyers Américains ne doivent plus être employés aux escortes. Ils doivent tous être renvoyés immédiatement a Queenstown.

"Certifie conforme."

The following action has been taken: A radio has been sent to Vice Admiral Sims in cipher requesting that the above message be confirmed in code. Further, the naval attaché in Paris, Lieut. Commander Sayles, has been communicated with by long-distance phone and requested to trace this message from Paris.

If this message is repeated or verified, you will immediately comply with the requirements contained therein and direct all destroyers to proceed immediately.

You will then cable to the Secretary of the Navy, via naval attaché Paris, as follows:

Destroyers which accompanied convoy to Europe have been ordered by Vice Admiral Sims to proceed immediately to Queenstown. Convoy groups are now being assembled for return passage to United States. Departure of destroyers leaves transports without adequate protection. Two submarines now operating off port entrance. Under circumstances consider it unsafe to dispatch transports from this port, and will hold all vessels of convoy here until instructions are received from Navy Department. Request commander United States naval forces in European waters be directed to send division destroyers to furnish escort to transports through danger zone, in order that department order to this effect may be complied with. French can not provide proper protection.

Lieut. Perkins, force engineer in the *Seattle*, has full cognizance of the situation.

ALBERT GLEAVES,
Rear Admiral United States Navy, Commander Destroyer Force, Atlantic Fleet,
Commander U. S. Convoy Operations in the Atlantic.

(Commander of United States forces was informed that everything must have destroyer escort. His order was reiterated.

GLEAVES ALSO APPEALED DIRECT TO SIMS.

Gleaves then appealed direct to Sims, as well as to the Navy Department. Following is a copy of that message and notation, from the files of Sims's headquarters in London:

Received: July 5, 1917.

Message from Admiral Gleaves to Admiral Sims of this present date.

Eight transports and two cruisers ready to sail, and can not for lack of safe escort. French can only provide two or three slow torpedo boats. This is entirely inadequate. Navy Department has cabled for quick return of transports. Request five destroyers be sent immediately for this duty. *Allen* went to sea with first group and was ordered to return to St. Nazaire before your order was received. Please acknowledge and inform me probable date of arrival of destroyers.

GLEAVES.

Note by Lieut. Commander Babcock: The above message was received by me from naval attaché, Paris, over French telephone. The naval attaché told me also that total French force at St. Nazaire consisted of three torpedo boats, speed under 15 knots, and one British sloop under French flag, and two French sloops, and that the services of these ships for escort duty of our transports involved abandonment of escort duty for French trade coming into St. Nazaire.

Admiral Gleaves's report shows that the first group had already sailed, accompanied by three destroyers, July 2, before Sims's message was received ordering them to proceed immediately to Queenstown. The second group of five transports sailed July 5, with an escort of only three French patrol vessels. On July 8 five destroyers arrived at St. Nazaire, and these escorted the third group, which sailed July 9, and the fourth, which sailed July 14.

SIMS'S ALLEGATION IN RELATION TO FIRST TROOP CONVOY.

Admiral Sims devoted several thousand words to a tirade in regard to this first convoy, but did he tell you about his ordering the destroyers to Queenstown and leaving our troopships at St. Nazaire without escort?

This may account for the fact that while in his letter of January 7, Admiral Sims did not mention troop transportation or any alleged errors of the department in connection therewith, in his testimony before your committee he tried to produce the impression that the department's arrangements endangered this convoy and that it was only by good luck that it arrived safely.

Sims makes much of alleged confusion and misunderstanding in regard to that convoy. If there was confusion and misunderstanding, it was on his side of the water, not on this. There never was a convoy for whose protection more complete arrangements were made. Four cruisers, 3 naval transports, 13 destroyers, 2 converted yachts and 2 fuel ships were assigned as escorts to proceed with the transports from New York clear across the Atlantic. To make assurance doubly sure, we also ordered Admiral Sims to furnish one division of destroyers to escort each group through the submarine zone. The one criticism made by Capt. Pratt, in his testimony, was that this was "uneconomical"; that is, that we provided more escort protection than was really necessary. Our policy was to be certain to protect the troops. It was better to provide too much escort than not enough. The policy and purpose of the department was to absolutely protect the lives of American soldiers at all pains, at all costs. The lives of American soldiers were dearer to us than any and everything else.

PLAIN INSTRUCTIONS SENT TO SIMS.

Admiral Sims's instructions regarding the first convoy were as clear as words could make them. Read the dispatch I sent him June 4, 1917, which he says he received June 6:

From: Secretary of the Navy, Washington.
Very confidential.

A convoy of American troops to France will sail about the 9th of this month. It is now contemplated to despatch four convoys, in groups of three or four transports, under separate escort. The first three groups have troops, and sail at about six hours interval. The first groups are of faster speed. The fourth group, bearing animals, will sail last, and may be delayed. All of the groups sail for a meeting place at sea, the location of which you will be informed of later. The meeting place will be reached, by the first group, about one week after sailing. The third and fourth groups in about nine days. I will advise you later of the dates and hour of sailing, and of arrival at the meeting place.

I hereby instruct you to furnish escorts, to consist of one division of destroyers for each convoy group, from the point of meeting to the port of debarkation. When this escort duty is finished those detailed to this service will be returned to their present service. Rear Admiral Gleaves will accompany the first group, in *Seattle*, and will have command of all operations of convoy.

DANIELS, *Secretary of Navy*.

Note this sentence in the last paragraph:

I hereby instruct you to furnish escorts, to consist of one division of destroyers for each escort group, from the point of meeting to the port of debarkation.

Could words be plainer? How could he possibly have any doubt as to whether he was to furnish escorts for all groups?

SIMS BEGAN TO RAISE QUESTIONS ABOUT ESCORT.

Instead of carrying out his orders, and looking after the escort of these troopships, Sims began to muddle up the situation and question whether we should use our own destroyers to protect our own troopships, sending me the following dispatch:

Sent: June 8, 1917.

To: Secretary of the Navy (Operations).

Through: State Department.

Eleven. Escort and convoy duty within danger zones is performed in accordance with experience, and each case is dependent upon disposition of allied forces at time, and latest information concerning enemy activities. Generally speaking duty is carried out in relays, ships escorting only in their assigned areas, and passing on the convoy to ships of next area on the route of the convoy. As our destroyers generally

operate farthest to westward, we participate in majority of escort duty. In view of above, suggest that, in future, the number and nationality of ships to be detailed for escort duty, be not specifically ordered by the department, but be determined here, dependent upon the disposition of allied forces, and circumstances, at the time of arrival at appointed rendezvous. Such a course will not only facilitate convoy duty, but also other military operations of submarine campaign.

Sims.

ORDERED TO USE OUR OWN DESTROYERS.

This dispatch of Sims surprised me. I did not see why he was raising questions about subsequent convoys and things in the future when the job in hand, his job and our job, was to get these troops across safely. I immediately sent him the following cablegram:

JUNE 10, 1917.

To: Alusna, London.

Department considers it essential, on account of the present sensitive public opinion that the escort orders for the first convoy, already issued, be executed by our own destroyers. The soundness of your recommendations are recognized by the department. For subsequent convoys, not more than three transports in one group, with escort of not less than one cruiser and three destroyers per group, is the present policy of the department. Please write giving outline plan for handling the European end of the escort duty for further convoys, and mention the numbers and types of vessels likely to be assigned to escort each group of transports, throughout each section of the danger zone. 21009.

DANIELS, *Secretary of the Navy.*

Just before the first groups sailed (they departed from New York June 14) the following dispatch from Sims was received:

Sent: June 12, 1917.

To: Secretary of the Navy.

Twenty-one. 21009. Letter follows next mail. Necessary for safety that, for future troop convoys, rendezvous and routes be designated and controlled from here, based upon latest information enemy activity. Initial orders, on sailing, should be subject to change by radio, after sailing. Troop ships should zigzag together, two to four point changes, irregularly. Destroyers should zigzag independently, avoiding regularity of position in reference to convoy. In accordance with British experience, when escorting cruiser enters dangerous submarine zone she is of practically no protection to convoy, and virtually becomes one of convoy.

It is necessary in danger zone that radio be not used, except for most important messages. Evidence indicates that radio direction finders have been able to locate large forces of radio work of distinctive nature. While in zone, experience indicates that convoy commander should leave maximum initiative and freedom of movement to senior destroyer commander, in view of his recent experience, and later knowledge of enemy methods. Enemy submarines do not have beam tubes. Line column (this word should probably have been "division") recommended, with force concentrated as much as consistent with zigzagging, this to reduce visibility of the force and facilitate offensive operations of destroyers. It is now practice here to furnish escort of one destroyer for single troop transport, three for two transports, four for three or four transports, and one destroyer per transport when number is greater than four.

Sims.

GLEAVES HAD GIVEN FULL INSTRUCTIONS COVERING EVERY CONTINGENCY.

If Sims had any suggestions as to what the transports should do on the way across, why did he not send it before? His first dispatch of June 8 did not outline any measure of procedure. But Admiral Gleaves, who was in personal command of the first group, had evolved a doctrine of conduct and given instructions to his officers and crews that covered every contingency, including what they were to do in case of submarine attack. That doctrine, briefly stated, was:

1. The use of maximum speed through the danger zone.

2. Trained lookout watches, made effective by an efficient system of communication between officers of the deck and fire-control watch.

3. Continuous, alert gun watches in quick communication with lookouts through the fire-control officer.

4. Constant zigzagging.

5. Minimum use of radio; reduction of smoke to a minimum; darkening of ships at night; throwing nothing overboard lest it point the trail.

6. A trained officer always alert and ready to use the helm to avoid torpedoes.

7. Specially prearranged day and night signals between ships on manner of maneuvering when submarines were sighted.

8. Use of depth bombs by all transports and escorts.

If there was any panic or confusion regarding those transports, it was not on this side of the water, or in the convoy. The transports under Gleaves's command were sailing without confusion, each officer knowing just what he was to do. But Sims was bombarding the department with cablegrams.

SIMS DEMANDED HE BE INFORMED MONTHS AHEAD.

On the very day the troopships sailed, June 14, Sims sent a long cablegram in which he said:

There are not now sufficient vessels available for escort duty, to insure safety of all vital supplies—

Bear in mind, Mr. Chairman, it is always "vital supplies;" supplies, always supplies, supplies; never life; never human life—

and also prospective movements of our troops and their supplies.

It is "our troops"; not "vital troops," but "vital supplies."

The CHAIRMAN. Just what would "vital troops" mean, Mr. Secretary?

Secretary DANIELS. Vital is life—essential. In other words, he put supplies as more essential than he did troops.

The CHAIRMAN. Of course all troops are vital, are they not?

Secretary DANIELS (continuing reading):

As our troops and their supplies will approach European coast outside of zones used by shipping and shipping convoys, it is mandatory that information be given immediately as to the probable numbers, and times of sailing, of all army shipping in next three months, as on this depends the program of merchant ship convoys, which must be arranged some time ahead. The approach of our first army convoys will seriously embarrass the shipping situation, as it will require all destroyers based on Queenstown, thus necessitating entire suspension of patrol and escort duty in that area. I can not lay too much stress upon the urgent necessity of increasing the destroyer and other patrol forces here with utmost dispatch.

Urgently request answer in next 24 hours, if possible, as to prospective movements of all Army shipping in next two or three months. This information is of vital importance. Also request information as to probable additions to antisubmarine forces these waters. The Admiralty informs me that present prospect is that if oil supplies are protected food supplies can not be. I again urgently recommend that all destroyers that can be brought to the coast of Ireland be sent at once.

Note that in this dispatch Sims demanded that we inform him "in the next 24 hours" as to movements of all Army shipping "in the next two or three months." Neither the Army or the Navy knew or could know, with any degree of accuracy, what troops or supplies could be sent in the next two or three months. Both Army and Navy were using every possible facility, to get troops and sup-

plies to Europe. Owing to the shortage of transports of our own, the Army was sending troops on passenger steamers, when space could be secured. Supplies were being shipped on cargo vessels as space was available. Yet this information, some of which could not be determined until just before sailing, Sims demanded for months in advance. That is a fair sample of his many unreasonable and impossible demands.

Notified of sailings and rendezvous.

Immediately after the sailing of the first three groups the following dispatch was sent Admiral Sims:

To: Vice Admiral Sims.

No. 20.

The convoys are arranged in groups.

Three groups sailed June 15 from New York.

Group 1 will arrive 6 a. m. June 23 at first rendezvous lat. 48° 55', long. 24° 20'.

Group 2 will arrive 4 p. m. June 23 at first rendezvous lat. 48° 10', long. 25° 100'.

Group 3 will arrive 6 a. m. June 25 at first rendezvous lat. 46° 45', long. 23° 65'.

The French Admiralty will designate second rendezvous and forward same to escorts via United States destroyers sent by you to first rendezvous.

Group escort flagships:

Group 1, U. S. S. *Seattle*.

Group 2, U. S. S. *Birmingham*.

Group 3, U. S. S. *Charleston*.

The sailing date for group 4 will be communicated later.

This information must be sent most confidentially and immediately to naval attaché, Paris.

Acknowledge receipt of this message for Vice Admiral Sims.

On June 18 Sims sent the following cable:

To: Secretary of the Navy.

No. 20 acknowledged. Please direct convoys to proceed from first rendezvous on course east, in absence of other instructions and until escort joins. They should use 600-meter wave length, and will receive instructions concerning rendezvous or enemy, from Queenstown via Valencia, call sign G. C. K., or via our destroyers. Use sig. code cypher.

SIMS.

When the fourth group sailed June 17 the following dispatch was sent:

To: Alusna.

For: Vice Admiral Sims.

No. 21.

Convoy group No. 4, U. S. S. *Hancock*, flagship, sailed June 17. Will arrive at rendezvous, with U. S. destroyers, latitude 47° 40' north, longitude 23° 00' west, at 6 a. m., June 28. Communicate this in most confidential manner to naval attaché, Paris. 14018.

DANIELS.

Sims says he was in doubt as to whether he was to furnish escort for this group, though he had been cabled positively to furnish escorts for all groups. He cabled asking for this information, and on June 21 the following dispatch was sent in reply:

To: Alusna.

From: Secretary of Navy.

For: Vice Admiral Sims 28.

Your 120. You are to supply destroyer escort for Army convoy groups 1, 2, 3, and 4. Please inform the naval attaché at Paris. 19021.

SIMS AT ADMIRALTY HOUSE AT QUEENSTOWN.

As you will see, there was no confusion or inconsistency in the dispatches and orders from the Navy Department. They are so perfectly clear it is hard to see how Sims could have misunderstood

them. If there was any mix up or confusion, it was on the part of Sims and the officers in London and Paris, for this is the first I ever heard of it.

Where was Sims during this period when our troops were going across the water? Not at his headquarters in London; not in Paris or St. Nazaire. He was at Queenstown for a week occupying Admiralty House, and acting in place of Admiral Sir Lewis Bayly, under whose command our destroyers operated, who was taking the first vacation he had enjoyed since the war began. Admiral Sims had sent me the following dispatch on June 14, which I received after the troop convoy had sailed:

Sent: June 14, 1917.

To: Secretary of the Navy (Operations).

Through: Admiralty.

Twenty-seven: Arrive Queenstown 16th, act in place of vice admiral, commanding during his absence about 17th to 24th. Request all cables for me be sent in British code to Admiralty, London.

Sims.

I did not want to deprive him of the honor or the enjoyment of a week's command at Queenstown, the only time during the war when he exercised direct command over any of our vessels. I supposed that he had, of course, before leaving London, made arrangements that would prevent any confusion in dispatches or delay in handling and acting upon them. His testimony before this committee is the first time I ever heard that there was any confusion in regard to this first convoy.

NO DANGER OF SUBMARINES, SAID SIMS—CONVOY ATTACKED THAT NIGHT.

While our first convoy of troops was on its way to France, information we had received led us to fear that enemy submarines were lurking in its path and might attack. Though we had no information definite enough to confirm our suspicion, I sent the following cablegram to Admiral Sims on June 20, 1917:

There is a prevailing impression here that enemy submarines are being withdrawn from the Mediterranean to be used to oppose the landing of United States troops in Europe.

Admiral Sims replied in a cablegram dated June 22, 1917:

There is no evidence to indicate enemy submarine movement aimed at American troop convoys. Losses in Mediterranean are increasing.

The very night Admiral Sims sent that dispatch the first group of the convoy was attacked, according to the report of Admiral Gleaves, who was in personal command of the expedition.

Sims's various attempts, in the medal awards hearings and elsewhere, to discredit the submarine attacks reported by Admiral Gleaves and the other officers, are of a piece with his attempts to throw doubt upon the entire conduct of this first expedition.

Admiral Sims said in his testimony before this committee at the hearing on January 17, 1920, that the first troop convoy was not attacked by submarines, and that there was not a submarine within 300 miles of the place where the attacks are said to have occurred. I quote the following from the record of that hearing:

You doubtless all remember having read in the press the famous battle which was reported on the 4th of July. That was an attack said to have been made by a whole lot of submarines against the first troop transports that went over.

The French Admiralty and the British Admiralty got out charts nearly every day showing where all the submarines were, and the chart that corresponds to the time that our first troop transports went over shows that there was no submarine within 300 miles of that position, and that has been officially reported in a report inclosing these maps, etc., that I sent to the Navy Department.

ATTACKS FIRST REPORTED BY SIMS HIMSELF.

That the first convoy was attacked by submarines was reported, without qualification, by Admiral Sims himself, who sent the following urgent cablegram to the Secretary of the Navy on June 30, 1917:

First group attacked by submarines, longitude 25 degrees 30, before arriving at first rendezvous. Second group attacked longitude 8. Strongly believe that enemy obtained information regarding movements of destroyers and also movements of troop convoys by intercepting and deciphering dispatches sent me in naval attaché's code.

On the next day, July 1, 1917, Sims sent another dispatch in which he said:

It is practically certain that the enemy knew positions of the first rendezvous and accordingly sent a submarine to intercept before juncture with destroyers.

Admiral Sims, as will be seen by these dispatches, not only made the unqualified statement that the convoy had been attacked, but also stated that it was practically certain that the Germans knew the positions of the first rendezvous and sent submarines to intercept the convoy. If we could not believe what Sims so positively stated in these dispatches, what could we believe?

Admiral Sims, in his attempt to discredit our transport force and its commander, would have your committee believe that the statements he made on June 30 and July 1, 1917, were not to be relied upon. We believe the statements he made then were true, and the statements he made later and repeated before your committee on January 17, 1920, were, to use a mild term, incorrect. The reports made by Admiral Gleaves and the commanders of the ships in that convoy gave a detailed account of the entire encounter.

FRENCH REPORTS AND SINKINGS SHOWED SUBMARINE WAS IN THAT VICINITY.

Admiral Sims told this committee that the British and French charts of that time show no submarine was within 300 miles of the point where the first attack occurred.

Admiral Gleaves said in his report, made just after the first convoy arrived:

8. When I was in Paris, I was shown, by the United States naval attaché, a confidential official bulletin of information issued by the General Staff, dated July 6, which contained the following:

"Ponta Delgada, Azores, was bombarded at 9 a. m., July 4. This is undoubtedly the submarine which attacked the *Fern Leaf*, on June 25, 400 miles north of the Azores and sank the *Benguela* and *Syria* on the 29th of June 100 miles from Terceira (Azores). This submarine was ordered to watch in the vicinity of the Azores, at such a distance as it was supposed the enemy American convoy would pass from the Azores."

Admiral Gleaves continues:

9. It appears from the French report just quoted above, and from the location of the attack that enemy submarines had been notified of our approach and were probably scouting across our route. It is possible that they may have trailed us all day on June 22 as our speed was well within their limits of surface speed, and they could have easily trailed our smoke under the weather conditions without being seen; their failure

to score hits was probably due to the attack being precipitated by the fortuitous circumstances of the *Seattle's* helm jamming and the sounding of her whistle, leading enemy to suppose he had been discovered.

TRACED COURSE OF SUBMARINE TO AZORES.

Admiral Gleaves' report of July 12, 1917, subject: Attacks on convoy by submarines on the nights of June 22, June 26, and June 28, 1917, states (par. 1):

About 10.15 p. m., June 22, the first group of the expeditionary forces, of which the *Seattle* was the leader, encountered enemy's submarines in latitude 28° 00' north, longitude 25° 50' west.

This position is 500 miles north of the Azores. The French official report stated that, on June 25, three days after the attack on the United States convoy, the *Fern Leaf* was attacked 400 miles north of Azores, only 100 miles from the place where the convoy was attacked. On June 29, four days later, the *Benquela* and *Syria* were sunk by a submarine 100 miles north of Terceira, Azores. On July 4 Ponta Delgada was bombarded by a German U-boat which shelled the town until it was driven off by the U. S. S. *Orion*, which was in port at the time. Hundreds of people in Ponta Delgada saw the submarine as it was on the surface in plain sight, and the bombardment took place at 9 a. m., in broad daylight. The submarine, from its position, could not see the *Orion*, and when the United States ship opened fire, the U-boat quickly submerged. The French official report, as quoted by Admiral Gleaves, said:

This submarine was ordered to watch in the vicinity of the Azores, at such a distance as it was supposed the enemy American convoy would pass from the Azores.

We had no reason then and have no reason now, to doubt Admiral Sims's own positive statements, made at the time, that the convoy was attacked; the reports of Admiral Gleaves, and the official report of the French General Staff to the same effect. This is not the first or only instance in which Admiral Sims has stated before this committee that statements made in his official dispatches to the department during the war were not to be relied upon, another instance, you recall, being recounted in paragraph 76 of his letter of January 7.

I ask leave to insert in the record the report of Admiral Gleaves in regard to the attacks on the first convoy, as well as his general report of the entire convoy which are submitted herewith, in which he gives in detail the evidence of all the officers and men on ships that saw submarines, and tells about their attacks.

The reports above referred to are here printed in full in the record as follows:

DESTROYER FORCE, ATLANTIC FLEET,
U. S. S. "SEATTLE," FLAGSHIP,
June 24, 1917.

From: Commander destroyer force, commander United States convoy operations in the Atlantic.

To: Commander in chief, Atlantic Fleet.

Subject: Report of convoy of first United States Expeditionary Force to France.

Inclosures: 2 (Specimen orders for convoy group); (copy of letter from Maj. Gen. Sibert, U. S. A.).

1. I have to report that the orders contained in the department's secret order of June 13, 1917, have been accomplished, and the first United States Expeditionary Force has been safely disembarked in France. Convoy operations were conducted in accordance with the President's order "Naval convoy of military expeditions" of

May 27, 1917. All vessels of convoy and escort have been returned to the United States with the exception of the destroyers and the *Kanawha*, which, by direction of the department, proceeded to Queenstown.

HISTORY OF OPERATION.

(A) ASSEMBLY OF ESCORT AND CONVOY.

2. On May 25, 1917, the commander destroyer force, Atlantic Fleet, was designated commander United States convoy operations in the Atlantic, and was directed to organize and escort to accompany to a port in France the first United States Expeditionary Force, sailing from New York on June 9, 1917.

3. The vessels designated by the War Department as transports for the troops, impedimenta and stores, viz: Steamship *Tenadores*, steamship *Saratoga*, steamship *Havana*, steamship *Pastores*, steamship *Monus*, steamship *Artilles*, steamship *Lenape*, steamship *Mallory*, steamship *Finland*, steamship *San Jacinto*, steamship *Montanan*, steamship *Dakotan*, steamship *El Occidente*, and steamship *Edward Luckenbach*, were assembled at New York, N. Y.

4. The convoy commander proceeded in the *Seattle* to New York, arriving at that port June 3, 1917. Inspection of the transports showed that the condition of work was such that the transports could not sail on June 9, and the date of sailing was changed to June 14.

5. The following vessels were assigned as escort: The cruisers *Seattle*, *Birmingham*, *Charleston*, and *St. Louis*; the naval transports *DeKalb*, *Hundercon*, and *Hancock*; the destroyers *Wilkes*, *Terry*, *Roe*, *Fanning*, *Burrows*, *Lamson*, *Allen*, *McCall*, *Prinston*, *Parker*, *Shaw*, *Ammen*, and *Flusser*; the converted yachts *Aphrodite* and *Corsair*; and the fuel ships *Cyclops* and *Kanawha*. The vessels, with the exception of the *Henderson*, *Shaw*, and *Parker*, were ready to sail on June 9. The delay until June 14 enabled the *Henderson* and *Parker* to get ready in time to sail with their respective groups and the *Shaw* to reach New York from San Francisco, which she did in the unprecedented time of 18 days, and reported ready for service.

(B) PREPARATION OF TRANSPORTS FOR DEPARTURE, AND DELAYS INCIDENT THERE TO.

6. The vessels chartered for transport service required certain work to fit them for this duty. In addition to changes necessary for the accommodation of troops, installation of armament, communication system, lookout stations, and other features pertaining to the safeguarding of the transports, had to be accomplished. This work was divided among various firms and contractors, companies from which the ships were chartered, and the New York Navy Yard. The short period of time allowed for preparation, the lack of workmen, and the above-mentioned divided control of work resulted in many vexatious delays. It was due in a large measure to the untiring effort and zeal of the naval officers attached to the transports that these vessels were finally made ready to sail on June 14. The work on the majority of transports was not completed until the night prior to sailing.

7. The inspection by the senior naval officer attached to the *Momus*, who was the representative on board of the convoy commander, indicated that the *Momus* was in need of a thorough overhaul at the time when she was chartered. The *Momus* seriously delayed by break-downs the passage of the group to which she was attached. On the arrival at destination, repairs by a dock yard were necessary before the *Momus* could sail on the return passage.

(C) ORDERS ISSUED.

8. The following confidential orders and instructions were issued to all vessels of escort and convoy. Copies of these orders have been furnished to the commander in chief and the department.

- (1) President's order for convoy of military expeditions.
- (2) Convoy commander's orders for ships in convoy.
- (3) Convoy commander's orders for target practice.
- (4) Operation order covering grouping and departure of the expedition.

9. In addition to the above, each vessel of the convoy and escort was given sealed instructions which contained the name of the port of destination and the route of the convoy group.

(D) DEPARTURE.

10. Prior to departure the vessels of each group had been assembled as nearly as their state of readiness permitted, two groups in the North River and two groups off Tompkinsville. The departure of the first three groups, consisting of transports carrying troops and their escort vessels, had been ordered for 8 a. m., 10 a. m., and noon, June 14, 1917, respectively, from Ambrose Channel lightship. On the morning of June 14 a dense fog in New York Harbor and its vicinity permitted visibility of only 200 to 500 yards. The movement of a large number of vessels under the above conditions was difficult in the extreme, but in spite of the fog, Groups I, II, and III sailed in close succession with only a few hours delay. The fourth group was scheduled to sail at 6 a. m., June 16. Delays in loading the transports which carried animals and cargo, prevented this group from sailing until the morning of June 17.

(E) PASSAGE OF GROUPS.

11. Group I.—Composition:

Escort: *Scuttle, DeKalb, Wilkes, Terry, Roc, Corsair.*

Convoy: *Tenadores, Saratoga, Havana, Pastores.*

12. The *Terry*, while standing out of New York Harbor for rendezvous at Ambrose Channel Lightship, fouled the net in the Narrows. The *Terry* returned to the New York Navy Yard for repairs to propellers and did not sail with Group I.

13. Group I, less *DeKalb, Wilkes, Havana*, and *Terry*, took departure from Ambrose Channel Lightship at 2 p. m., June 14, 1917. On account of fog it was impossible to assemble Group I at the lightship, and the *DeKalb, Wilkes*, and *Havana* had passed the lightship and stood to the eastward before the arrival of the remainder of group I. At 8 a. m., June 15, the *DeKalb, Wilkes*, and *Havana* joined Group I.

14. Due to the inability of the *Corsair* to maintain the group speed of 12½ knots, she was directed on June 17 to drop back to Group II, and the *Fanning* was brought up from Group II to replace the *Corsair*. The *Fanning* joined Group I on the morning of June 18 and continued with group to destination.

15. At sunset June 16, the *Roe* developed condenser trouble and reported using excessive amount of fuel to maintain speed. On the morning of June 17 the *Roe* was directed to lie to, repair condensers, and then return to the United States. At 6.30, a. m. June 20, sighted the *Maumee* and *Henley*. The *Wilkes* and *Fanning* oiled from the *Maumee* and convoy set course for rendezvous with destroyers from England. At 10.15 p. m., June 22, latitude 48° 00' N., longitude 25° 50' W., Group I was attacked by submarines. In all, the wakes of five torpedoes were sighted. No vessels of convoy or escort were hit. This attack is covered by separate report.

16. At 11 p. m., June 22, radio was received from the *Cushing* giving a rendezvous to the eastward of the rendezvous designated for meeting the destroyers from England. The *Cushing* requested that Group I steer for this rendezvous and stated that the *Cushing* and destroyers would intercept group en route to new rendezvous. Convoy passed through first rendezvous at 5 a. m., June 23, and changed course for the second rendezvous. At 8.50 a. m., Group I was joined by destroyers *Cushing, Jacob Jones, Conyngham, Nicholson*, and *O'Brien*. The *Winslow* joined at 11 a. m., June 28.

17. It may be noted here that the accuracy with which our destroyers from England intercepted all convoy groups at the time and place expected is commendable. The convoy commander has been informed that the United States destroyers operating off Ireland never fail to pick up the ships which they are sent to meet. Apparently this facility in making contacts does not exist among the vessels of either the French or English.

18. At 11 a. m., June 23, changes course to pass to the northward of Belle Isle in accordance with request of the commanding officer of the *Cushing*, and continued on this course until 6.10 a. m. June 25, when the French sloop *Regulus* with Commander Sayles, United States Navy, United States naval attaché to France, on board, and the French patrol ship *Oise* made contact with Group I.

19. At the request of the *Regulus*, Group I changed course to pass to the southward of Belle Isle. With the *Regulus* leading, passed to the southward of Belle Isle and stood in to Croisic Roads. Anchored in Croisic Roads at midnight 25–26 June and established patrol of destroyers.

20. From Belle Isle to Croisic Roads was the most anxious period of the voyage. When group I was passing to the southward of Belle Isle, radio report was received that two hours previously two submarines had been sighted 30 miles to the southward of the group's position, both submarines standing to the northward. In other words, they could easily have been within six miles of the convoy at the time the radio was received. In spite of this fact, all vessels of the group were compelled to slow well

outside the entrance to Quiberon Bay and take on pilots. Night came on and conditions were favorable for a sudden attack. The pilot boats were exceedingly slow in coming alongside, and apparently much misunderstanding existed among the pilots. German mines had been thickly strewn in the neighborhood of Belle Isle, and the approaches to Quiberon Bay and St. Nazaire. It was considered inadvisable to proceed without pilots. After much delay, which could have been avoided had proper preparations been made beforehand, the pilots were finally taken on board. The group anchored for the night in Croisic Roads, an open roadstead, with only such protection as the destroyer patrol could furnish. That the group was not attacked at this time seems inexplicable. Had it not been for the delay mentioned above, Group I would have anchored off St. Nazaire at 8.30 p. m., before dark, as was planned and contemplated.

21. Group 21 got underway at 4.30 a. m., June 26, and at 6.45 a. m., June 26, anchored in the harbor of St. Nazaire.

22. The weather throughout the trip was fair and mild, with the exception of the first two days when heavy fog was encountered. All vessels of convoy and escort held target practice en route, firing at towing spar with imitation periscope attachment. Group I zigzagged continuously during daylight throughout the passage until arrival on soundings off the coast of France, and began night zigzagging June 22, the night of the attack. The speed of the group was $12\frac{1}{2}$ knots until joined by destroyers from England, when highest speed of group was maintained, varying from 14 to $15\frac{1}{2}$ knots. The route of the group was as follows:

Ambrose Channel Lightship to: Latitude $39^{\circ} 35' N.$, longitude $69^{\circ} 40' W.$; thence to latitude $39^{\circ} 35' N.$, longitude $46^{\circ} 15' W.$; thence to latitude $43^{\circ} 20' N.$, longitude $38^{\circ} 10' W.$; thence to latitude $48^{\circ} 55' N.$, longitude $24^{\circ} 20' W.$; thence to St. Nazaire, France.

22. The following formation was maintained by Group I: Transports in double column, distance and interval 1,200 yards; *Seattle* two points on starboard bow of leading transport of right column, distance 1,000 yards; *DeKalb* two points on port bow of leading transport of left column, distance 1,000 yards; destroyers on flanks and ahead.

23. Group II.—Composition:

Escort: *Birmingham*, *Burrows*, *Fanning*, *Lamson*, *Aphrodite*.

Convoy: *Henderson*, *Momus*, *Antilles*, *Lenape*.

24. Group II took departure from Ambrose Channel Lightship at 3 p. m., June 14, 1917. On the morning of June 17 the *Fanning* was despatched to join Group I.

25. At noon, June 18, *Lamson* was detached and directed to proceed to Boston, Mass. At 7 a. m., June 21, the *Burrows* refueled from the *Maumee*. The *Corsair*, which had dropped back from Group I joined Group II. From the *Maumee*, Group II set course for rendezvous with destroyers from England. Before arriving at this rendezvous a radio was received from the *Wadsworth* requesting Group II to steer for rendezvous to the eastward. This was done and before arrival at this new rendezvous Group II was joined by the *Wadsworth*, *Tucker*, *Benham*, *Cummings*, and *Nicholson*. At the request of the commanding officer of the *Wadsworth*, course was set to pass to the northward of Belle Isle. At 11.50 a. m., latitude $47^{\circ} 01' N.$, longitude $26^{\circ} 28' W.$, the *Birmingham*, which was zigzagging 4,000 yards in advance of the convoy, crossed the wake of a submarine. This wake extended for nearly a mile at right angles to the course of the group and was clearly defined. The disturbed water of the wake was still in motion when the *Birmingham* crossed it. The submarine was not seen. The convoy maneuvered to bring the wake astern and later resumed course.

26. At 1.30 p. m., June 26, latitude $47^{\circ} 10' N.$, longitude $6^{\circ} W.$, the periscope of a submarine was sighted by the *Cummings*. *Cummings* dropped a depth charge over submarine. This attack is covered by a separate report.

27. At 4.40 p. m., June 26, the French destroyers *Gabion* and *Gleive* joined Group II, and brought instructions for the convoy to pass to the southward of Belle Isle. Preceded by the French destroyers, Group II proceeded to St. Nazaire and anchored at 5.50 a. m., June 26, 1917.

28. The weather throughout passage of Group II was pleasant and mild, with the exception of two days of fog at the start. All vessels of the escort and convoy held target practice en route, firing at periscope target. Group II, during passage, took the following route:

Ambrose Channel Lightship to latitude $39^{\circ} 35' N.$, longitude $69^{\circ} 40' W.$; thence to latitude $39^{\circ} 35' N.$, longitude $46^{\circ} 15' W.$; thence to latitude $45^{\circ} 20' N.$, longitude $38^{\circ} 10' W.$; thence to latitude $48^{\circ} 10' N.$, longitude $26^{\circ} W.$; thence to St. Nazaire, France.

29. Group III.—Composition:

Escort: *Charleston*, *Cyclops*, *Allen*, *McCall*, *Preston*.

Convoy: *Mallory*, *Finland*, *San Jacinto*.

30. Group III took departure from Ambrose Channel Lightship at 3.35 p. m., June 14, 1917. At 9 a. m., June 15, at signal "Man overboard" from the *Preston*, group counter-marched in order to repass spot where men fell overboard. *Preston* and *Cyclops* lowered boats and men were recovered.

31. At 8 a. m., June 18, *Preston* was detached and directed to proceed to a United States port. *Allen* and *McCall* refueled from the *Maumee* in the forenoon of June 22 at the prescribed rendezvous. At daylight June 25, Group III was joined by the destroyers *Porter*, *Sampson*, *McDougal*, *Davis*, *Wainwright*, and *Jarvis*, at assigned rendezvous.

32. At 6.50 a. m., June 26, *McCall* was detached and directed to proceed to St. Jones, Newfoundland, to refuel and thence return to the United States. At 8.50 a. m., June 27, Group III was joined by two French torpedo boats. At the request of the commanding officer of one of the torpedo boats, course was set to pass to the southward of Belle Isle. With French destroyers in the lead, Group III proceeded from Belle Isle to St. Nazaire, anchoring at 10.30 a. m., June 28, 1917.

33. The weather throughout passage was pleasant and mild, with the exception of fog for two days at the beginning of the trip. All vessels of the convoy and escort held target practice with periscope target en route. Group III zigzagged continuously during daylight throughout passage. The route of Group III was as follows:

Ambrose Channel Lightship to latitude 59° 35' N., longitude 69° 40' W.; thence to latitude 59° 35' N., longitude 46° 15' W.; thence to latitude 43° 20' N., longitude 38° 10' W.; thence to latitude 46° 45' N., longitude 23° 55' W.; thence to St. Nazaire, France.

34. Group III use the following formation: Daylight—Transports in line; *Charleston* 1,000 yards in advance of center of line, *Cyclops* 1,000 yards in rear of center of line; destroyers ahead and on flanks. Night formation—Transports in column: *Charleston* leading, destroyers ahead and on both flanks.

35. Group IV.—Composition:

Escort: *St. Louis*, *Hancock*, *Shaw*, *Parker*, *Ammen*, *Flusser*.

Convoy: *Montanan*, *Dakotan*, *El Occidente*, *Edward Luckenbach*.

36. Group IV took departure from Ambrose Channel Lightship at 9 a. m., June 17, 1917. At 10.30 p. m., June 22, *Flusser* was detached and directed to return to the United States. The *Terry*, having effected repairs, accompanied Group IV instead of Group I. The *Terry* was detached from Group IV at 5 p. m., June 25, and proceeded to St. Johns, Newfoundland. On June 26, the *Shaw* oiled from the *Maumee*. No other destroyers oiled from the *Maumee* as the *Kanawha* had previously oiled the *Parker*, *Ammen*, and *Terry*. This was necessary as some of the *Kanawha's* cargo oil was contained in leaky tanks. Leakage from the *Kanawha's* cargo tanks left an oil streak astern of the convoy during the entire passage.

37. At 10 a. m., June 26, latitude 47° 36' N., longitude 22° 22' W., Group IV was attacked by submarines. The commanding officer of the *Hancock*, the commander of Group IV, considered at the time that the alarm was false, and that no submarines had been sighted. Later detailed reports from the vessels of the group showed clearly that submarines had been sighted and fired upon the *St. Louis* and *Kanawha*. This attack is covered by separate report.

38. Group proceeded from *Maumee's* position to rendezvous with destroyers from England. At 3 p. m., June 28, at this rendezvous, the *Patterson*, *Warrington*, *Trippe*, *Paulding*, *Brayton*, and *Walke* joined the group. At 12.05 p. m., June 30, Group IV was joined by vessels in the lead, group passed to the southward of Belle Isle and at 6.42 p. m., July 1, anchored in Quiberon Bay. At 1 a. m., July 2, all vessels of Group IV got underway and proceeded to St. Nazaire.

39. Weather throughout passage of Group IV was pleasant and mild. All vessels of escort and convoy held target practice en route using periscope target. Route of convoy was as follows:

From Ambrose Channel Lightship to latitude 39° 35' N., longitude 69° 40' W.; thence to latitude 39° 35' N., longitude 46° 15' W.; thence to latitude 43° 20' N., longitude 38° 10' W.; thence to latitude 47° 40' N., longitude 23° W.; thence to St. Nazaire, France.

(F) PORT OF SAINT NAZAIRE, FRANCE.

40. St. Nazaire, the seaport of Nantes, at the mouth of the Loire River, which had been selected as the port of disembarkation, was taxed to the utmost to accommodate the numerous vessels of the escort and convoy which transported the first United States expeditionary force. The harbor proper is small and the channel of such depth that vessels of deep draft can enter only at high water. A 5-knot tide renders movements of vessels within the harbor impossible except at slack water. An inner

basin, entered by a lock, provides excellent berthing space for approximately a dozen vessels of 12,000 to 15,000 tons. This basin is maintained at a depth of 30 feet by pumping and can be entered only at high water.

41. The anchorage outside of the basin for large ships are few, and by no means safe. The holding ground is bad, especially at Spring tides. It was necessary for the ships of the escort, including the collier and tankers, to anchor in the harbor. The *Seattle*, *DeKalb*, and *St. Louis*, at various times, dragged anchor and serious damage was narrowly averted.

(G) ARRIVAL AT ST. NAZAIRE.

42. Pilots were furnished to the ships of each group for entering St. Nazaire. The arrival of each group was timed for high water, and the transports were immediately berthed inside the basin. Anchorages in the harbor were assigned to the cruisers and fuel ships by the captain of the port. Ships were anchored under the direction of the pilots. Berthing of transports inside the basin was conducted with dispatch and skill.

(H) DISEMBARKATION AND DELAYS INCIDENT THERETO.

43. A camp for the troops of the first expeditionary force was in course of preparation about 3 miles from the town of St. Nazaire. This camp was practically ready for occupancy by the time of arrival of the first group. As soon as each transport was docked, the unloading of the personal impedimenta of the troops began and on the day following, the troops marched ashore from each transport. All transports carried cargo and stores in addition to troops. Five hundred negro stevedores had been brought from the United States by the Army Quartermaster Department to unload the cargo of the transports. The arrival of 10 transports within three days rendered it impossible for this number of men to expeditiously carry on the unloading. An attempt was made to procure the services of local stevedores. Only a small number were procured, however, and the assistance which these rendered was practically nil. Effort was made to work the stevedores overtime, but this resulted only in longer hours without increasing satisfactorily the amount of work.

44. The four first group transports were unloaded in a reasonably short time and the stores landed on the docks. Insufficient transport service by means of trucks and wagons very quickly congested the docks, which made the unloading of the second, third, and fourth groups of transports increasingly difficult.

45. The marine regiment, transported in the *Henderson*, *DeKalb*, and *Hancock*, used their own men in unloading and transporting stores. No difficulty was experienced with these vessels. The work proceeded most expeditiously and the vessels were unloaded in minimum time.

46. In addition to cargo and stores, each transport with one or two exceptions carried sufficient cargo coal to replenish bunkers for the return trip. The shifting of this cargo coal to bunkers presented a serious problem. The ships' crews that had been shipped under the seaman's act, and were not in the Army Transport Service, refused to work at this duty until finally paid an exorbitant rate by the Army Quartermaster. Sufficient stevedores to accomplish the shifting could not be taken from the work of unloading cargo. Finally it was necessary in several cases to turn to the navy gun crews.

Delays in unloading may be summarized:

- (a) Lack of sufficient men to unload cargo from ships.
- (b) Lack of transportation relieving congestion of cargo on docks.
- (c) Lack of facilities for shifting coal from the cargo holds to bunkers.

(I) DEPARTURE OF RETURN GROUPS.

47. As quickly as transports were unloaded, refueled, and replenished with water, they were assigned to groups for the return passage through the active submarine danger zone.

48. In accordance with the department's instructions, the destroyers which accompanied the groups from the United States were to be retained to safeguard transports through this danger zone. Further, destroyers as needed were retained from the divisions which had come out from England.

49. Each group, for return passage to the United States, was directed to proceed as a group, protected by destroyers for a distance of 600 miles from St. Nazaire, then to dismiss destroyers, disperse group, and proceed singly to the United States.

50. The following vessels, *Saratoga*, *Havana*, and *Lenape*, were made ready to sail on July 2, and were dispatched under escort of the cruiser *Birmingham* and the destroyers *Sampson*, *Jarvis*, and *Allen*, at 10 a. m., July 2, 1917.

51. On July 3, 1917, a telephone message from Vice Admiral Sims, transmitted via the United States naval attaché at Paris and the commandant de le marine at St. Nazaire, directed that all destroyers be dispatched immediately to England. This order was complied with and the departure of the second group was, in consequence, delayed until sufficient protection for the group through the danger zone could be procured. The French Navy Department was requested to furnish as many destroyers as possible, and the force commander requested the Navy Department by cable to direct that sufficient destroyers be returned from England to furnish adequate protection.

52. On July 5, the following vessels, which were ready to sail, were organized into Group II: *Pastores*, *Tenadores*, *Mallory*, *DeKalb*, and *Henderson*. Under escort of three French patrol vessels, this group sailed at 3 p. m., July 5.

53. On July 8, the *Porter*, *Ericsson*, *O'Brien*, *Nicholson*, and *Cassin* arrived at St. Nazaire and reported for escort duty. The following transports were ready to sail: *Hancock*, *Finland*, *San Jacinto*, and *Antilles*. At 6 a. m., July 9, this group, under escort of the cruisers *Charleston* and *St. Louis* and the above-named destroyers, sailed for the United States.

54. The unloading of the remaining transports and the repairs to the *Momus* were completed on the night of July 13 and the morning of July 14. The five destroyers which had sailed with the third group returned to St. Nazaire the morning of July 12. At noon, July 14, the transports *El Occidente*, *Edward Luckenbach*, *Dakota*, *Momus*, and *Montana*, and the fuel ships *Cyclops* and *Kanawha*, sailed under the escort of the *Seattle*, *Porter*, *Nicholson*, *Ericsson*, *Cassin*, and *O'Brien* and four small French destroyers. The departure of this group was immediately preceded by two mine sweepers, four airplanes, and one dirigible, thus providing every possible protection.

55. The other groups had been directed by the force commander not to cross the tenth meridian north of latitude $47^{\circ} 30'$. From daily reports of operations of submarines on west French coast, it was noted that the submarines which had been operating to the westward of the Isle d'Yeu in about latitude 46° were shifting to the northward to about $47^{\circ} 30'$. The last group, therefore, crossed the tenth meridian at $46^{\circ} 10'$, and thence steered west to longitude $17^{\circ} 20'$, whence the United States destroyers with *Kanawha* returned to Queenstown. The French destroyers were released at the tenth meridian.

(J) FUEL.

56. At New York prior to the departure, arrangements for fueling were made so that all vessels of both escort and convoy sailed with the maximum amount of fuel that it was possible to carry.

57. The *Maumee*, accompanied by the *Henley*, had been stationed by the force commander in latitude $42^{\circ} 10' N.$, longitude $40^{\circ} 35' W.$, for the purpose of refueling the destroyers accompanying the convoy. This was successfully accomplished. She refueled the destroyers *Fanning*, *Wilkes*, *Burrows*, *Allen*, and *Shaw*. During the voyage the *Kanawha* fueled the destroyers *Parker*, *Ammen*, and *Terry*. This refueling of destroyers at sea is covered by a separate report.

58. On arrival at St. Nazaire the convoy commander was informed by the United States naval attaché that he had borrowed from the French Government 6,000 tons of coal for the use of the convoy and that this coal was at Brest and that it would be necessary for vessels to proceed to Brest to coal.

59. It was found that all of the transports, with the exception of the *Havana*, *Saratoga*, *Antilles*, and *Momus*, carried sufficient coal for the return passage. The *Cyclops* cargo was sufficient to coal these four transports and all of the naval vessels, with a balance of approximately 700 tons remaining. This balance was landed on the lock at St. Nazaire and invoiced to the United States Army base commander for the use of the Army or any United States naval vessel which might enter the ports. The coal at Brest was not used.

60. Destroyers were oiled as necessary from the *Cyclops* and *Kanawha*. The *Cyclops* issued approximately 275,000 gallons. The *Kanawha* issued approximately 9,000,000 gallons.

(K) COMMUNICATION.

61. Before sailing a list of radio calls were prepared giving each transport and man-of-war a three-letter call from the Berne list. Radio communication was prohibited, except in cases of emergency, and then these three-letter calls were to be used. In case of communication between senior officers of groups, calls were to be authenticated by use of radio signal calls as given in the D. N. C. publications. An ordinary quintuple cipher was assigned for the use of all ships.

62. Radio was used between senior ships and our own destroyers in arranging rendezvous.

63. United States shore stations' spark signals were received at a distance of 900 miles by day and 1,200 or more by night, depending on atmospheric conditions. With the amplifier, Radio, Va., arc signals were received at all times, except when prevented by interference or when low power was used. For example, received 43 A1Nav while in St. Nazaire and 44 A1Nav one day out on return trip. Time signal and press from Radio, Va., on spark, were received as far east as the twenty-fifth meridian.

64. In European waters all work from ship to shore and vice versa is done on 600 meters, causing a great deal of interference. This wave length is probably used because all ships have 600 meter wave and use it for S. O. S. or information broadcasting. The designation for information of submarine activity obtained from reports of ships and by cross bearing of direction finders is the word "allo," preceding a message. It is not to be depended on absolutely.

65. While at St. Nazaire all messages for further transmission were sent to the French naval commandant in French. Here the messages were put into French secret code and transmitted to the United States naval attaché, who recoded the message and forwarded it to final destination.

66. Communication from Radio, Va., by broadcasting is not reliable, due to interference on 6,000 meters. A great many spark stations use this wave length almost continuously.

67. While in European waters it was found that a great many codes were in common use, both by the French and English, of which we have no knowledge. Further, many systems of call letters were used which did not agree with the call letters furnished to the *Seattle*.

(L) TARGET PRACTICE.

68. All vessels of convoy and escort, except the *Corsair*, held target practice during passage, firing at imitation periscope target. The majority of guns' crews of both the transports and the naval vessels were recruits of only a few months' service who had not previously fired a gun.

69. Performances on the whole were most satisfactory.

70. The form of target practice used was devised to fulfill the following:

- (a) To take place at sea during passage to France.
- (b) Not to interfere with course, speed, or coal and fresh water economy of convoy.
- (c) To accustom newly enlisted men to gunfire.
- (d) To give the spotters, guns' crews, lookouts, and observers a target similar in appearance and characteristics to a submarine showing only its periscope.

71. The practice as carried out accomplished the above results, and demonstrated:

- (a) That a well directed and rapid fire will probably prevent a submerged submarine obtaining the data necessary to accurately fire its torpedoes.
- (b) That fire should be opened instantly upon sighting submarines regardless of range and deflection.
- (c) That sights should be kept set so that the first shot will fall short in range.
- (d) That spotting against a moving periscope will probably be erratic.

(M) PERSONNEL ATTACHED TO TRANSPORTS.

72. *Naval personnel*.—The three naval officers attached to each transport were of invaluable service in expediting the work of the transports in port in addition to their more legitimate duties in direct charge of the safety of the transport at sea.

73. The naval enlisted personnel attached to transports was on the whole, satisfactory and the spirit shown by the men was commendable. Most of the members of the guns' crews are recruits of only a few months service. Their lack of training and experience was a handicap, but it is expected that this handicap will be rapidly overcome in the duty which they are now performing. The lack of responsible trained petty officers among the gun crews is a serious matter. It is a necessity that dependable petty officers form a part of the transports' gun crews.

74. The merchant officers of the transports were, on the whole, a highly efficient and capable body of men. Of the crews, little good can be said. These men are mostly the sweeping of the docks, taken on board just prior to sailing. They were shipped as regular merchant crews, and were not enlisted in the Army Transport Service. Men of all nationalities were shipped, and it is extremely probable that many spies were among the number. In one case a member of the crew of the *Momus*, of German extraction, openly threatened the safety of the ship. The crews of these transports at all times formed a serious menace to the safety of the convoy.

75. In connection with the arrival of the transports and the debarkation of men and unloading of material, the services of Capt. Asher C. Baker, United States Navy,

retired, were of inestimable value to the convoy commander. His perfect knowledge of the French language, his familiarity with French customs, and his intimate and personal acquaintance with French officials were a major factor in getting the ships ready for the return voyage. All of his work was marked by cheerfulness and tact and his zeal and energy were indefatigable.

76. It is not only a pleasure but a duty to state that the Secretary of the Navy's cable of July 4 expressing the department's satisfaction with the operations of the convoy was only made possible by the hearty cooperation, interest, and efficiency of all the officers and men who composed the expeditionary force and escort.

77. In conclusion, the force commander wishes to state that the utmost cooperation and support was received from the Army, and that the two services worked together in unison and each with appreciation and consideration of the duties and responsibilities of the other. A copy of a letter from Maj. Gen. Sibert is appended to this report.

ALBERT GLEAVES.

HEADQUARTERS FIRST EXPEDITIONARY DIVISION.

France, July 2, 1917.

COMMANDING OFFICER UNITED STATES NAVAL CONVOY,
First Expeditionary Force.

MY DEAR ADMIRAL GLEAVES: The safe arrival, this date, of the fourth and last division of the first convoy prompts me to convey to you my sincere congratulations upon the successful completion of the difficult task with which you were charged.

In as far as I can speak from personal observation and from hearsay, I desire also to express my appreciation of the highly courteous treatment which the Army invariably received at the hands of your subordinates in the Navy charged with duty on board of the transports.

I am,

Very sincerely, yours,

WM. L. SIBERT.

Major General, United States Army.

DESTROYER FORCE, ATLANTIC FLEET,
U. S. S. "SEATTLE," FLAGSHIP,
St. Nazaire, France, July 12, 1917.

From: Commander destroyer force.

To: Commander in chief, Atlantic Fleet.

Subject: Attacks on convoy by submarines on the nights of June 22, June 26, and June 28, 1917.

1. About 10.15 p. m., June 22, the first group of the expeditionary force, of which the *Seattle* was the leader, encountered enemy's submarines in latitude 48° N., longitude 25° 5' W.

2. At the time it was extremely dark, the sea unusually phosphorescent; a fresh breeze was blowing from the northwest which broke the sea into whitecaps. The condition was ideal for a submarine attack.

3. The transports were in double column of 1,200 yards interval, 600 yards distance; *Tenadores* and *Havana* in the right column, the former leading; the *Saratoga* and *Pastores* in the left column, the *Saratoga* leading; *Seattle* 1,000 yards, two points on starboard bow of *Tenadores*, and *De Kalb* 1,000 yards on port bow of *Tenadores*; *Fanning* 2,000 yards, four points on the port bow of the *Saratoga*; speed, 12 knots; convoy zigzagging.

4. Shortly before the attack the helm of the *Seattle* had jammed and the ship took a rank sheer to starboard; the whistle was blown to indicate this sheer. In a few minutes the ship was brought back to the course. At this time the officer of the deck and others on the bridge saw a white streak about 50 yards ahead of the ship, crossing from starboard to port at right angles to our course. The ship was immediately run off 90° to starboard at full speed. I was asleep in the charthouse at the time. I heard the officer of the deck say, "Report to the admiral a torpedo has just crossed our bow." General alarm was sounded, torpedo crews being already at their guns. When I reached the bridge the *De Kalb* and one of the transports astern had opened fire, the former's shell fitted with tracers. Other vessels of the convoy turned to the right and left, in accordance with instructions. *Wilkes* crossed our bow at full speed and turned toward the left column in the direction of the firing.

5. At first it was thought on board the *Seattle* that the wake was that of a torpedo, but from subsequent reports from other ships, and in the opinion of Lieut. Roberts,

who was on the bridge, it was probably the wake of the submarine boat itself. Two torpedoes passed close to the *De Kalb* from port to starboard, one about 30 yards ahead of the ship and the other under her stern, as the ship was turning to the northward. Capt. Gherardi reports the incident thus:

"Steaming in formation on zigzag course, with base course 75° p. s. c., standard speed, 12 knots (64 rev.). At 10.25 sighted wake of a torpedo directly across our bow about 30 yards ahead of the ship. Changed course 90° to left and went to torpedo defense stations. Fired two 1-pounder shots and one 5-inch shot from port battery as alarm, in addition to six blasts from siren. Passed through two wakes; one being that from U. S. S. *Fanning* in turning to northward, the other believed to have been from the passing submarine. A second torpedo wake was reported at about 10.35 from after lookouts. After steaming in various courses at full speed, resumed course 89° p. s. c., at 11.10 for rendezvous, zigzagging as per plan No. 2. At 12 set course 56° p. s. c. and speed at 15 knots (80 rev.), zigzagging as per plan No. 1."

6. The torpedoes fired at the *Havana* passed from starboard to port about 40 yards ahead of the ship, leaving a distinct wake which was visible for four or five hundred yards. Col. McAlexander, United States Army, was on the starboard wing of the bridge of the *Havana* at the time and states: "I first saw a white streak in the water just off the starboard bow, which moved rapidly across the bow very close aboard. When I first saw it it looked like one very wide wake and similar to the wake of the ship, but after crossing the bow and when in line with it there appeared two distinct and separate wakes with a streak of blue water between. In my opinion, they were the wakes of two torpedoes."

7. The submarine which was sighted by the *Seattle* was seen by the *Wilkes* and passed under that ship. The *Wilkes* went to quarters. When the alarm was sounded in the *Wilkes*, Lieut. Van Metre was roused out of his sleep and went to his station at the occillator, and found that it gave unmistakable evidence of the presence of a submarine. He had been there only a few seconds when the radio operator took the receiver and reports, "Submarine very close to us." As the submarine passed the *Wilkes* and the *Seattle's* bow and disappeared close aboard on our port bow, between the columns it was followed by the *Wilkes*, which ran down between the columns, and when the latter resumed her station she reported that there were strong indications of the presence of two submarines astern, which were growing fainter. The *Wilkes* was then sent to guard the rear of the convoy.

8. When I was in Paris I was shown by the United States naval attaché a confidential official bulletin of information issued by the General Staff, dated July 6, which contained the following:

"Punta Delagada, Azores, was bombarded at 9 a. m., July 4. This is undoubtedly the submarine which attacked the *Fern Leaf* on June 25, 400 miles north of the Azores and sank the *Benguela* and *Syria* on the 29th of June 100 miles from Terceira (Azores). This submarine was ordered to watch in the vicinity of the Azores, at such a distance as it was supposed the enemy American convoy would pass from the Azores."

9. It appears from the French report just quoted above, and from the location of the attack that enemy submarines had been notified of our approach and were probably scouting across our route. It is possible that they may have trailed us all day on June 22, as our speed was well within their limits of surface speed, and they could have easily trailed our smoke under the weather conditions without being seen; their failure to score hits was probably due to the attack being precipitated by the fortuitous circumstances of the *Seattle's* helm jamming and the sounding of her whistle, leading enemy to suppose he had been discovered.

10. The *Birmingham*, leading the second group, encountered two submarines, the first about 11.50 a. m., June 26, 1917, in latitude 47° 01' N., longitude 06° 28' W., about a hundred miles off the coast of France, and the second two hours later. The *Wadsworth* investigated the wake of the first without further discovery. The *Cummings* sighted the bow wave of the second at a distance of 1,500 yards and headed for it at a speed of 25 knots. The gun pointers at the forward gun saw the periscope several times for several seconds, but it disappeared each time before they could get on, due to the zigzagging of the ship. The *Cummings* passed about 25 yards ahead of a mass of bubbles which were coming up from the wake and let go a depth charge just ahead. Several pieces of timber, quantities of oil, bubbles and debris came to the surface. Nothing more was seen of the submarine. The attacks on the second group occurred about 800 miles to the eastward of where the attacks had been made on the first group.

11. The voyage of the third group was uneventful.

12. In the forenoon of June 28, when in latitude 47° 38' N., longitude 22° 22' W., the *Kanawha* opened fire on an object about 300 yards distant which he thought was a submarine. The commander of the group, however, did not concur in this opinion, but the reports subsequently received from the commanding officer of the *Kanawha*

and Lieut. Carey are too circumstantial to permit the incident from being ignored. The commanding officer states:

"(b) The only unusual incident of the trip worth mentioning was on the 28th day of June, about 10.05 a. m. the lookouts reported something right ahead of the *Kanawha*. (I had the bridge at the time.) When I looked, I saw what appeared to be a very small object on the water's surface, about a foot or two high which left a small wake; on looking closer and with the aid of binoculars, I could make out a shape under the water about 250 to 300 yards ahead, and which was too large to be a blackfish, lying in a position about 15° diagonally across the *Kanawha's* course.

"(b-1) I ordered the port bow gun to open fire on the spot in the water and sounded warning siren for convoy; when judging that ship had arrived above the spot first seen, I ordered right rudder in order to leave the submarine astern.

"(b-2) A minute or two later, the port after gun's crews reported sighting a submarine on port quarter, and opened fire at the same time. The lookouts from the top also reported seeing the submarine under the water's surface and about where the shots were landing.

"(b-3) The ship kept zigzagging and firing from after guns every time something was sighted.

"(b-4) Lieut. (Junior Grade) Lee C. Carey, United States Navy, was in personal charge of the firing and reports that he saw with all the gun crews and lookouts aft, the submarine fire two torpedoes toward the direction of the convoy, which sheered off from base course to right 90° when alarm was sounded.

"(b-5) All the officers and men aft had observed the torpedoes traveling through the water and cheered loudly when they saw a torpedo miss a transport. They are not certain though which one it was, as the ships were not in line then and more or less scattered.

"(b-6) The gunnery officer and all the men who were aft at the firing are certain that they saw the submarine and the torpedoes fired by same.

"(b-7) A separate report of Lieut. (Junior Grade) Lee C. Carey, United States Navy, the gunnery officer, is herewith appended.

"(b-8) The *Kanawha* kept zigzagging until it was considered that danger was past, and in due time joined the escorts and convoy formed column astern.

"(b-9) Report by signal was made to group commander of sighting submarines and torpedoes."

13. From this experience of the convoy it appears that the transportation of troops can best be accomplished by vessels of high speed and a sufficient fuel endurance, proceeding singly, accompanied by not less than two destroyers for protection during daylight and for the purpose of saving life throughout the entire voyage.

14. Copies of reports of commanding officers *Seattle*, *De Kalb*, *Havana*, and *Birmingham* are inclosed; also copy of report of Lieut. (Junior Grade) L. C. Carey, of the *Kanawha*.

ALBERT GLEAVES

EX-GERMAN LINERS CONVERTED INTO TRANSPORTS.

The greatest increase in America's troop-carrying facilities was furnished by the big German liners interned in our ports, which were converted into troop ships and carried half a million troops to Europe. It was not until three months after war was declared that these vessels were placed under control of the Navy. Their machinery had been so badly damaged that the German crews believed they could not be repaired, and, even if this could be done, it would be from a year to 18 months before they could be put into service. But the Navy was confident it could be done in far less time, and, when they were put under our control in July by Executive order, set about the work at once. The first the *Aeolus* (formerly the *Grosser Kurfurst*), was placed in commission August 7; and within six months all those big liners had been repaired, converted into troop ships, and were carrying troops to Europe. This resulted in a saving of 12 months in time and effected an economy estimated at more than \$20,000,000.

Secretary DANIELS. I wish to say here, Mr. Chairman, that of all of the accomplishments of the Navy in the war, in a material way, the

skill, the expedition with which these German ships were converted into troop carriers by the Navy Department stands among the very first. One of the German engineers on one of these ships, when he thought he had ruined it, said, "It will take two years to ever get this ship running, and I will take off my hat to anybody who can do it." Well, he has been bareheaded ever since, because the Navy did it within a few months.

These ships were invaluable to us. They increased many times the troop-carrying capacity of our transport force, and actually transported half a million troops before the armistice.

TOOK EVERY MEASURE TO INSURE PROTECTION AND EFFICIENT USE OF
THESE SHIPS.

We took every measure possible to secure the most efficient use of these ships and to insure the utmost protection that could be afforded. As soon as we were assured they would be transferred to the Navy the following dispatch was sent to Admiral Sims:

JULY 1, 1917.

To: Admiral Sims.

One of the most important cross-water operations in which our naval forces will be involved concerns the safe transportation of American troops to French soil.

All the time, you will observe, in every cablegram insisting upon the safe transportation of American troops. That was the first, the biggest, the most important task of the American Navy, and we performed it well. The telegram goes on to say:

Every guaranty has been given the War Department that the Navy Department would do its utmost to safeguard the lives of the troops in transit.

Fourteen of the best, largest, and fastest interned German ships under complete naval control will be commissioned in the Navy and used to transport troops. It is imperative that these ships should receive the utmost destroyer protection possible on the passage in and it is desirable, on account of the valuable character of the ships and the difficulty of adequately replacing them if lost, to guard them on the passage out. After consultation with the various authorities, especially the French, submit an outline of what in your opinion is the best method of conducting such operations. Each ship will hold over 4,000 troops.

Should such ships sail singly or in company? How much protection can they expect from our destroyers and how much from the French on the voyage out, or do you contemplate giving that protection without our own forces? Should we, in addition to giving all the advanced information possible, ask of you a rendezvous for each ship or group sailing and a course in from there, or will you appoint in advance a rendezvous and course which rendezvous and course will hold good until changed by you?

Regarding supply ships of the Army of which there will be many of moderate speeds, should it be the policy of them to sail singly or together in groups, in order that they may receive the greatest protection during that portion of the journey where it is most needed?

These are the points which, even if before discussed by you, we desire to have clearly indicated in order that the greatest cooperation and efficiency may result from our combined efforts.

OPNAV.

In view of the fact that this dispatch merely directed Admiral Sims to consult with the various authorities and report as to the best method of operating and protecting these ships, it is difficult to understand his expression of resentment and denunciation. He said to you:

I do not think it would be possible for me to convey to you the discouragement of receiving at that date, after the miles of cables and letters I had sent in there on the 9th of July exhibiting the crassest ignorance of the elements of the whole problem.

In view of the extensive communications which I had sent to the department concerning these convoys, previous to this dispatch, I think it requires no explanation on my part to convince the committee of my feelings upon receiving such a message as this. Here was question after question asking about handling convoys which I had explained over and over again.

Gentlemen, I think it will require no explanation to convince the committee, which has heard several miles of the "miles of letters and cables" Sims sent, that what we wanted was not another mile or two of talk, but specific answers to plain questions. What enraged Sims was evidently that last sentence:

These are the points which, even if before discussed by you, we desire to have clearly indicated in order that the greatest cooperation and efficiency may result from our combined efforts.

We wanted to work out for the operation of these vessels a well-defined plan which neither Sims nor anyone else could misinterpret or misunderstand—a plan based on the best experience and advice of the allied authorities. We were taking no chances on picking out from the "miles" of Sims's dispatches recommendation that might, or might not, apply. He was our representative in Europe, it was his special business to furnish us information and answer questions of this character, and there wasn't any need of his wanting to "jump overboard" whenever he received a dispatch that requested specific answers on subjects he had before treated in a general way.

Commenting particularly on the question, "Do you think that they should sail in company or singly?" Admiral Sims said:

I would not have believed that that question could be asked at that stage of the game, how we should put the convoy in, and when we had put it in.

As a matter of fact, though we had put the convoy system into effect with the first troop expedition and continued it all through the war; the Allies, as well as ourselves, found it preferable, in some cases, to sail singly ships of high speed. The *Leviathan* made trips across the Atlantic successfully, sailing alone, her high speed being a better protection, in many respects, than escorts in convoy with slow ships.

SIMS OPPOSED USE OF THE "LEVIATHAN" AS A TROOP SHIP.

The greatest of all transports used during the war—the largest ship afloat—was the *Leviathan*, formerly the German *Vaterland*. She carried nearly 100,000 troops to France, as many as an entire fleet of little transports. Yet Sims strongly opposed the use of the *Leviathan* as a troop ship, and his insistence on sending her to Liverpool instead of Brest resulted in a loss of considerable time in her operation.

When the *Leviathan* was nearly ready for operation, Sims advised against its use as a troopship, sending the following cablegram:

From: Sims.

To: Opnav.

Brest, France, roads is only French har- or that can take deep-draft transports. I have previously pointed out difficulty handling freight in open roadstead with few available lighters. Freight might be transhipped in small vessels, but long delay would follow, and it is considered much better to ship all freight direct from United States in suitable vessels destined to usual ports.

The names of transports are not given, but I assume they are coaled for round trip. The consensus of opinion—

Telegraphing from London, now—

is against using U. S. S. *Leviathan* as troop transport. Her greater length makes her better target than smaller vessel. Other vessels listed as transports not larger than *Baltic* and *Adriatic*, both of which are carrying our troops.

For large high-speed vessels that require coal on this side, like U. S. S. *George Washington*, U. S. S. *America*, U. S. S. *Mount Vernon*, U. S. S. *Agamemnon*, I should be informed when they are ready and I shall endeavor to get Admiralty to make concessions and receive them Liverpool. Vessels of this type should cross in separate high-speed convoys and carry no freight for France. 04524.

In his troop transport letter of November 2, 1917, addressed to me, Admiral Sims wrote:

I consider Liverpool the safest port of entry in the submarine area. For the present, however, I think we shall have to send our large ships to Brest Roads, and then, when they are unloaded, escort them into England to be coaled.

I have previously reported against using the *Vaterland* for the present until we have a little more experience in handling the other large transports. The *Vaterland* is, of course, a much larger target, and injury to her would be a serious affair. I am assuming too that all of the troops that we have to transport for the next few months can be accommodated in other transports, assisted by British liners. Whenever the situation becomes pressing, I presume we shall have to use the *Vaterland* and take the additional risk.

This also shows that Sims was of the opinion that all the troops ready to be sent to Europe at that time and "for the next few months" could be carried in the transports we then had, without using the *Leviathan*. This is in striking contrast with the argument he puts forth to support his charge that the Navy delayed troop transportation, and that, if it had not been for losses of shipping, we could have had a million troops in France by March 1, 1918.

We did, at first, adopt Sims's advice to send the *Leviathan* to Liverpool instead of Brest; and thereby lost weeks of the services of that great vessel. The *Leviathan* was of such deep draft that, on one occasion, she had to wait an entire lunar month at Liverpool before she could get out of that harbor. When she was sent direct to Brest, as the Navy Department directed, and would have done the first time except for Admiral Sims's advice, which was mistakenly accepted, her turn around was measured in hours instead of weeks; and she broke all records in the number of troops transported. That was one instance in which we did follow Sims's advice, events soon proved how mistaken it was, and we had to carry out our original intention of sending the *Leviathan* to Brest.

SAID "PUBLIC MIND SHOULD BE PREPARED FOR POSSIBLE LOSS OF A TRANSPORT."

After Sims had informed us that submarines were operating far out in the Atlantic, and that one was on its way to America, we thought it wise to escort troop ships further out to sea, and on May 13, 1918, the following dispatch was sent to Admiral Sims:

6002. Due to known presence of enemy submarine so far out and state of public mind in regard to troop convoys, department desires you put extra emphasis—

Always putting extra emphasis—

upon the duty of escorting troop convoys both in number of destroyers and distance to which they operate. If necessary in order to insure safe landing of troops, fewer destroyers shall be assigned to the protection of ships carrying merchandise. 15016002.

We did not say "may." We found we had to say "shall," because he was putting the emphasis all the time on merchandise, and we were putting it on men—lives.

Admiral Sims's reply, dated May 16, 1918, and addressed to the Chief of Naval Operations, was as follows:

MAY 16, 1918.

From: Admiral Sims.

To: Chief of Naval Operations.

7941. Your 6002. While I fully understand department desires to do everything possible to safeguard transit of troops across the Atlantic, I must point out that it is impossible to insure safe conduct landing of all troops, no matter how many destroyers are assigned to escort duty.

This was May 16, 1918; it was impossible to give them escort. The impossible was made possible. He was wrong. He goes on to say:

It is my earnest opinion that the public mind should be prepared for possible loss of a transport. As an initial step in this direction I would recommend that newspaper stories of the destruction of submarine by merchant vessels be suppressed if possible. Such stories frequently appear based upon statements of passengers and officers of steamer, and are almost without exception entirely incorrect and give the public a false impression as to the ease with which submarines may be destroyed.

As I have been always fully alive to the necessity of giving a maximum of protection to troop convoys, the escorting of store ship convoys has already been reduced to a limit below which I do not deem it advisable to go. Convoys are now met by destroyers as far to westward as submarines are known to be operating, if within the fuel endurance of the destroyers, so that nothing further can be done in this respect.

The department is, of course, fully alive to the fact that under present conditions the safety of vessels carrying merchandise to Europe is hardly less essential to the successful prosecution of the war than is safety of troop transports, and we might conceivably lose the war through making excessive demands upon our escort forces for the protection of troops. 09016. 7914.

Sims.

PRESIDENT LINCOLN SUNK TWO WEEKS LATER.

Two weeks after Admiral Sims sent this dispatch the westbound transport *President Lincoln* was sunk about 450 miles from Brest. She was unescorted at the time, the destroyer escort having left her 12 hours before she was torpedoed.

Only three American troop ships were sunk during the war—the *Antilles*, the *Covington*, and the *President Lincoln*.

Two others—the *Finland* and the *Mount Vernon*—were torpedoed, but were navigated back to port and repaired. All these were attacked while returning from France.

In his testimony before this committee in the medal awards hearing, Admiral Sims told you the reason these were sunk was that "they were not efficiently protected going back as they were coming"; that his proposition was, "as soon as two or three transports were empty to let them go out with an inferior escort and take a chance on the thing."

I may say in parenthesis, when he said "take a chance on the thing," that the transports coming back not only were ships which were valuable, but they had wounded men, men who had been gassed and shelled; and I never did believe in taking chances on human life.

The following is quoted from his testimony (pp. 293-294) in the medal awards hearing:

The CHAIRMAN. Admiral, in this connection can you tell me how many transports were lost during the course of the war?

Admiral SIMS. About five or six. All of those were lost coming back.

The CHAIRMAN. None of them with troops aboard?

Admiral SIMS. None of them with troops aboard, except men that were returning to the United States.

Now, the bulk of these men returning to the United States were men who were ill or wounded, who were coming to the United States for treatment, and to whom the United States owed, if possible, a higher duty even than to the men going over. [Continuing reading:]

The reason of that was that they were not as efficiently protected going back as they were coming. The orders we had were to make the turn around as rapidly as possible. The necessity was to get troops over, and the risk of the empty transport was justifiable to that extent. We could, of course, have given them the same protection going back as they got going over, provided you would be willing to wait—say there are 10 transports coming over with thirty or forty or fifty thousand troops—if you are willing to wait until they all could take their turn at the wharves, and discharge their cargoes, etc., and then send them back as a body. That would have involved very considerable delay; and there is this about it: Ten or twelve ships coming in, escorted by 10 or 12 destroyers, have a certain protection. If you cut the convoy in two, and give each 6 destroyers, they have got much less, because it is the flanks only that we protect. They do not dare attack the middle. If you still further subdivide them and subdivide the destroyers, it is still less.

That was our proposition—as soon as two or three transports were empty to let them go out with an inferior escort and take a chance on the thing.

He ought to have said, "Take a chance on the lives of wounded and sick men."

Coming in, there was almost no risk to the transports, because they were always escorted by at least three times as much protection in destroyers as we gave to merchant convoys, and sometimes ten times as much. Moreover, they were rapid, and they were zigzagging, and it was extremely dangerous for any submarine to attack them; so that the danger was not very great. Moreover, we put them through a band of water where we never put any of the merchant ships, a band about 150 miles wide. The general impression that you would get from reading the accounts in the press would be that there were so many submarines in the ocean that it was hard work to push a ship across the ocean, that the danger was very great, and that there were a great many submarines out. As a matter of fact, throughout the war the Germans were never able to maintain to the westward of Ireland and the westward of the British Channel more than an average of 8 or 9 submarines. I have known it to be as high as 15, and I have known it to be down to 2 or 3, but the average was about 8 or 9, on account of the voyage out and the voyage back and the time under repairs, the time for resting the crews, and ordinary accidents of navigation; so that there were only these 8 or 9. If they had put all of the submarines in this band of water, and we had kept the band in the same place, you can easily play a game with yourself and see that if you place the submarines at random, and draw lines representing the track of the convoys, the chances of any one of those 8 submarines even seeing a convoy are small.

Now, you must add to that the fact that if they had put and kept the 8 submarines there, and put none where the merchant ships were coming in, although they might have sunk some of our troop ships, and might have killed 15,000 or 20,000 troops, they would have thereby lost the war, because the war depended upon getting the supplies in.

I wish to say, Mr. Chairman, that the war depended upon getting the troops to France. Everything else was really of minor importance.

Twenty thousand troops lost there would not have been any more serious than 20,000 lost on the battle front. It sounds a little heartless to say so, but from the military point of view it would have been relatively of less importance. Moreover, as that band of water did not always stay in the same place—we moved it around—they would have spent perhaps a week before they found out that we had moved it, etc. So that it was not very difficult to protect transports going in, and we took risks coming out.

The Navy Department didn't want to "take a chance on the thing." We wanted returning transports better protected, and urged it time and again, and during the war Sims argued against such suggestions and told us, as in his dispatch of May 16, 1918, "Nothing further can be done in this respect"; yet in his hearing quoted above he told you that "we could, of course, have given them the same protection going back as they got going over, if they had been willing to wait."

DISCOUNTED EFFORTS TO PROTECT TROOP SHIPS AND SOLDIERS' LIVES
AS "LARGELY POLITICAL."

In view of the evidence presented, his testimony before this committee in the medal awards hearing, as well as the present inquiry, the sharp reminders and orders that had to be given him, this committee can not believe that "there was never any question" about Admiral Sims's recognition that the primary mission of the forces under his command was the protection of American troops.

Admiral Sims, in fact, seems to have regarded our insistence on the utmost protection of troopships and safeguarding the lives of American soldiers as "largely political." Though he never stated that to me, he seems to have expressed that opinion freely to British officers, as will be judged from the following letter of September 24, 1918, from Admiral Sims to Admiral Bayly, the British commander at Queenstown. Here is what Admiral Sims wrote to Admiral Bayly, the British admiral:

I think I mentioned that some of our quite valuable supply ships are going through the Mediterranean two at a time escorted by one destroyer and sometimes not escorted at all. We must also face the fact that the number of supply ships coming into the western ports of France are continually on the increase, and this makes it quite impossible to give adequate protection to the empty transports going westward. It is also a fact that our troop transports are not as strongly escorted as they probably should be. This is particularly true of the ones that pass in through the Channel and up the Thames.

Now, Mr. Chairman, this was an American admiral writing to a British admiral. He said:

There is no doubt at all that the principal dignitaries at home are very nervous lest some of our troop transports be torpedoed.

Mr. Chairman, we were very nervous. One hundred and eleven million American people were very nervous and they were very anxious, and they have very little patience with an American admiral who would write to a British admiral that the American people were nervous about the lives of the men who were to protect the liberties of the world. I repeat that:

There is no doubt at all that the principal dignitaries at home are very nervous lest some of our troop transports be torpedoed. Of course, you will understand that this nervousness is largely of a political kind.

An attack upon the American Government in a letter to a British admiral, that because we wanted to protect the lives of our 2,000,000 soldiers it was political. If I had seen that letter, gentlemen, I should have ordered him home by wire and put him under court-martial. [Continuing reading:]

It is therefore apparent that the first reinforcements will have to be devoted to the services above indicated.

That is, his orders were that he must take care of the protection of our troop transports rather than of vessels containing munitions and supplies. Then, he goes on to say again:

These necessities, as I have said, are largely political.

Personally, I can not persuade myself that the Germans have any intention of concentrating their submarine efforts against our troop transports. There was an explanation published in the German papers explaining to the German people why it was that they were not successful in stopping the arrival of troop transports. It seems to me that this explanation is perfectly sound from a military point of view. It pointed out that transports may arrive anywhere from the north of Scotland to the south of France; that it was exceedingly difficult to intercept them; that they were heavily escorted; and that a great effect could be produced upon the enemy by attacking merchant vessels bringing in supplies of all kinds. This is exactly my opinion. It seems to me that if I were a Hun and in complete command of the Hun submarine campaign, I would give the submarines orders not to attack loaded transports. This for the reason that the submarine runs a very considerably greater danger in attacking through the escort of a troop transport than through the escort of a much larger merchant convoy.

He is writing to a British admiral, now.

Moreover, the torpedoing of an occasional troop transport would not sensibly decrease the number of men flowing into Europe, while the torpedoing of a number of merchant vessels will eventually limit the number of troops that we can maintain in Europe. There is a commission over here now earnestly looking for more ships than our shipyards will be able to supply in the coming year. If they can not find these ships, the flow of troops will have to be decreased.

That letter needs no comment.

BELITTLE PART OF UNITED STATES NAVY IN TROOP TRANSPORTATION.

Admiral Sims constantly belittled the part played by the United States Navy in troop transportation. In his speech in London on October 11, 1918, at the luncheon given to American editors and newspaper correspondents, who he must have hoped and expected would give the widest publicity to his remarks, he said:

Americans seemed to regard it as a miracle of their Navy that they had got a million and a half troops here in a few months and had protected them on the way. We didn't do that. Great Britain did. She brought over two-thirds of them and escorted one-half.

That was in his speech to the editors of America.

We would not detract one iota from the credit due, and generously rendered, to our British friends for their splendid work in transporting American troops. Without their ships it would have been impossible to have gotten to Europe in the spring and summer of 1918 the 1,700,000 troops that were transported after the March drive. But at the same time we do not want to see the United States Navy deprived of just credit for the work it did in troop transportation.

AMERICAN VESSELS CARRIED NEARLY ONE-HALF; ESCORTED FOUR-FIFTHS OF TROOPS SENT TO EUROPE.

The statistics of the United States cruiser and transport force, as given in Appendix F, Annual Report of the Secretary of the Navy for 1919, state that of the 2,079,880 troops transported to Europe previous to the armistice 952,581 were carried in American vessels, 1,006,987 by British ships, 68,246 by British-leased Italian ships, 52,066 by other vessels, French, Italian, etc. Percentages carried: By British

ships, 48.25; by British-leased Italian ships, 3; by French, Italian, and other foreign ships, 2.5; by American vessels, 46.25 per cent. These tables state that the number of troops under United States escort was 1,720,360—82.75 per cent; under British escort, 297,903—14.125 per cent; under French escort, 61,617—3.125 per cent.

These figures show that American vessels carried nearly half the total number of troops transported (46.25 per cent) and escorted over four-fifths of them (82.75 per cent); yet Sims said the British carried two-thirds and escorted one-half.

NAVAL VESSELS BROUGHT HOME 1,700,000.

But this tells only half the story. Bringing back the American troops from Europe was almost as big a job as was taking them over. For this very little foreign shipping was available, and seven-eighths of all the troops and passengers returned from Europe were brought home in United States naval vessels. Naval transports took to Europe 911,047 men; other American vessels, 41,534. Naval vessels and transports brought back from Europe approximately 1,700,000 troops and passengers; all other vessels, American and foreign, a little more than 250,000. The exact figures up to October 1, 1919, were:

Total troops and passengers brought back from Europe to Oct. 1, 1919.....	1, 945, 367
Brought back by cruiser and transport force, United States Navy.....	1, 686, 944
Brought back by all other vessels, United States and foreign.....	258, 423

Several thousand returned subsequent to that date, bringing the total transported in naval vessels and transports up to approximately 2,600,000 carried on naval vessels.

Thus, it will be seen that a total of 2,600,000 men were transported by the Navy either to or from Europe. In the face of that record how puny and impotent are any efforts to disparage the great work accomplished by our Navy in troop transportation. I ask to insert in the record the tables, compiled by the statistical division of the United States cruiser and transport force, giving in detail the number of troops transported.

(The matter referred to is here inserted in the record, as follows:)

174273—20—135

APPENDIX F.

TROOP TRANSPORTATION.

(Tables compiled by Headquarters, Cruiser and Transport Force, United States Navy.)

TROOPS CARRIED TO EUROPE BY UNITED STATES AND FOREIGN VESSELS.

	Carried by United States Navy trans-ports.	Num-ber of United States Navy trans-ports sailed.	Carried by British ships.	Num-ber of British-leased Italian ships.	Num-ber of British-leased Italian ships sailed.	Carried by other United States ships.	Num-ber of other United States ships sailed.	Carried by other ships, French, Italian, etc.	Num-ber of other ships sailed.	Carried by United States Navy trans-ports and by other United States ships.	Num-ber of United States Navy trans-ports and other United States ships sailed.	Total trans-ported by all ships.	Total ships sailed.

NOTE.—Discrepancy of 6,294 in the tables showing number of passengers returned to the United States since November 11, 1918, is due to the difficulty in crediting the different transports with the exact number of passengers each returned about the date the armistice was signed. Discrepancy of 6,160 between the tables showing passengers returned to the United States prior to the armistice is due to the same cause.

Secretary DANIELS. Just before his departure from London for "the States," a "Summary of activities of United States naval forces operating in European waters" was issued to the press from Admiral Sims's headquarters. This bore on the first page the following caution:

IMPORTANT NOTE.

These notes are designed to furnish material only for those who may wish to write something regarding the operations of the United States naval forces in European waters.

No part of them should be directly quoted nor should any statement be made as to how or by whom they were supplied.

Why Admiral Sims enjoined such secrecy as to the origin of the information I do not know; nor why the writers were warned not to make any statement "as to how or by whom they were supplied."

As this statement was pretty widely circulated, I hope I am not violating any deep confidence in revealing its source and quoting a few of the statements made therein:

The United States Navy escorted 62 per cent, or about 1,250,000 troops, of United States expeditionary forces to Europe without loss from enemy action.

British transports carried during the war from the United States 53 per cent of all American troops sent to France. American transports carried 45 per cent, and French transports carried 2 per cent.

During the rush period, that is, from April 1 to October 31, 1918, British transports carried 57 per cent of the American troops and American and French transports carried 43 per cent. During the month of August, British transports carried 65 per cent of the American troops.

Admiral Sims did not mention in this summary the immense work being performed by the Navy in bringing American troops home from Europe, though at the time we were bringing them back at the rate of a quarter of a million per month in Navy transports, and brought back some 1,500,000 in eight months, returning, in all, as I said, about 1,700,000.

WORK OF THE CRUISER AND TRANSPORT FORCE.

I wish Admiral Gleaves, who was in command of the cruiser and transport force from its inception up to September 1, 1919, when he was made commander in chief of the United States Asiatic Fleet, could appear here as a witness and tell you how that great force was built up, how the many difficulties were overcome, and describe to you the work it did for more than two years. But the record speaks for itself, and some figures and extracts from Admiral Gleaves's reports will give you some idea of the force and its work.

Beginning with a few cruisers and transports hastily gathered together to transport the first of the American Expeditionary Forces to France in 1917, the cruiser and transport force grew before the armistice to a large fleet, comprising 66 American vessels—24 cruisers and 42 transports manned by 3,000 officers and 42,000 men; these being augmented by four French men-of-war and 13 foreign merchant vessels—a total of 83. After the armistice, in order to bring home the American Army in the shortest possible time, this force was increased by the utilization of 15 battleships and 10 cruisers as troop carriers; the use of 9 large German vessels which were turned over to us under the armistice arrangements to be used for this purpose, and

the conversion of 56 cargo vessels into troop carriers. The maximum number of vessels assigned to and operated by the Navy in troop transportation was 142, with facilities for carrying 13,914 officers and 349,770 men.

STEADY INCREASE IN TROOP-CARRYING CAPACITY.

At the beginning of troop transportation, in June, 1917, the total capacity of our transports was only about 13,000. The large increase came with the putting into service of the interned German vessels, which were repaired and manned by the Navy. By October the capacity was practically doubled, and this was further augmented when the *Leviathan* and the last of these big ships were put into operation. In December we carried over 37,445 in naval transports; the Navy in the meantime having taken over and manned a number of Army transports previously manned by civilian crews.

In 1917 very little foreign shipping was available, though some thousands of officers and men went to Europe on foreign passenger vessels, and of the 194,938 United States troops which crossed the Atlantic in that year, that is 1917, 113,429 sailed in American vessels, 104,894 of them in naval transports.

In January, 1918, four convoys were dispatched by the Navy, carrying 25,662 troops. In February the Austrian ship *Martha Washington* was added to the force, and three convoys, averaging five ships each, were dispatched, carrying 39,977 troops. Up to March 1 the total number of troops transported was 292,232, of which 179,068 had been carried in American vessels, 170,533 of them in United States naval transports.

FOREIGN SHIPPING MADE AVAILABLE IN QUANTITIES AFTER MARCH DRIVE.

With the launching of the great German drive in March, 1918, the demand for American troops became imperative, and the Navy responded by increasing the troop shipment for the month to 56,278. The fast passenger ships *Great Northern* and *Northern Pacific* were brought around from the Pacific and, with the *Matsonia*, were added to the force. In February foreign vessels had carried over only 9,259 men, but when the great drive on the western front occurred in March, allied shipping in large amounts was assigned to the carrying of American troops. Getting them to France was the most vital thing in the world to the allied cause.

Numerous British vessels were assigned to the carrying of American troops, and in this the British Government rendered us an invaluable service, though, of course, the United States paid for the passage of every man transported. In March British vessels carried 27,626, other foreign ships 1,895; United States naval transports 58,278. In April United States transports carried 67,553; British vessels 47,362; British-leased Italian ships 2,626; other foreign vessels 1,794.

The great Cunard and White Star liners, which had transported Canadian troops to England and British troops to and from the Mediterranean, were put into the Atlantic service. In addition to the British liners, the British ships *Czar*, *Czaritza*, *Dwinsk*, *Kursk*, and

Vauban; the French ships *France*, *Lutetia*, and *Patria*; the Italian ships *America*, *Caserta*, *Dante*, *Aligheri*, *Duca D' Asta*, and *D' Italia*, and the Brazilian ship *Sobrol*, formerly a German vessel, were chartered from the Allies by the War Department, and sailed in United States naval convoys.

Troop transportation rose from 89,239 in March to 120,072 in April and to 247,714 in May. In April the Navy carried 67,353; in May, 96,273; in June, 115,256; in July, 108,445; in August, 116,422; in September, 107,025. British ships in April carried 47,362; in May, 133,795; in June, 140,172; in July, 175,526; in August, 137,745; in September, 134,576. In October the troop movement decreased, United States ships carrying 72,092 and British vessels, 94,214. It will be seen that the biggest troop movement was from May to October, inclusive, and in those six months, in addition to the large numbers carried by British ships, 68,246 troops were carried by British-leased Italian vessels and 40,499 were carried in other foreign vessels, French, Italian, etc.

OF FIRST MILLION, 524,457 WERE CARRIED IN AMERICAN SHIPS.

On July 1, 1918, the total number of United States troops in France or embarked for Europe was 1,029,003. Of these, 524,457 had been sent in American ships, 456,854 in British vessels, 18,476 in French and Italian ships, and 29,218 in Italian vessels leased by the British Government. It is interesting to note that of the first million American troops landed in France, 320,000, nearly one-third, were carried in the former German ships which had been taken over by this Government and had been repaired and were manned and operated by the Navy.

By the end of hostilities, November 11, 1918, 2,079,880 American troops had been transported to France, of which 952,581 were carried in American vessels; 1,006,987 in British ships, 68,246 in British-leased Italian vessels, and 52,066 in other ships, mostly French and Italian.

ALL RECORDS BROKEN IN BRINGING TROOPS HOME.

The return movement began immediately after the armistice, but only a few soldiers, 8,197, were returned in November and 70,089 in December. In January, 1919, 120,136 were returned, 97,039 of them in naval transports; in February, 140,831; 96,368 in naval vessels. With the increase in the number of transports, 207,361 sailed for home in March, 274,503 in April, 313,210 in May, and in June, the high-water mark of July, 1917, when all available allied shipping was being utilized, 311,359 was exceeded, and 340,946 troops were embarked, 314,167 of them in United States naval vessels. By July, 1919, a million and a half soldiers had been brought back to the United States. By October 1, 1919, 1,945,367 had been brought home from Europe, 1,686,944 in naval vessels and transports and 258,423 by all other vessels, United States and foreign.

And all this was accomplished without the loss, through enemy action, of a single soldier on a troop transport manned and operated by the United States Navy. Does history record such another record as that?

WOULD HAVE BEEN BETTER TO HAVE LOST TROOP TRANSPORTS THAN CARGO SHIPS, SIMS AGAIN SAYS.

The latest testimony of Admiral Sims regarding his attitude toward troop and cargo ships was given in the Fletcher court of inquiry. The Army and Navy Journal, of April 17, 1920, reports Capt. Twining, Sims's chief of staff, as saying:

Admiral Sims was not of the opinion in July and August (1917) that it was expedient to send oil-burning destroyers to Brest, for those craft were fully employed from the Queenstown base doing the same work as the forces based on France, and their time would not have been fully occupied.

The Queenstown destroyers were employed 67 to 75 per cent of the time on useful work in bringing in supply ships when cargo ships were more valuable than transport ships.

"Rear Admiral W. S. Sims was the chief witness before the court on April 15," says the Army and Navy Journal, and in its report of his testimony is the following:

After Commander Daniels returned to London, said Admiral Sims, in a personal letter of advice and admonition he gave Admiral Fletcher a résumé of the commander's report. Asked what he meant by warning Admiral Fletcher that in case of loss of a ship, "nothing will save your head or mine," Admiral Sims said it was an admonition, "that both of us would get racked of it; that's all." There was a political significance in the loss of ships, he said. In further explanation he said: "It may seem heartless for me to say so, but under the conditions it would have been better to have lost troop transports, for we had to save cargo ships at all hazards."

If I had believed, Mr. Chairman, that Admiral Sims cherished any such idea; that he valued supplies more than the lives of American soldiers; that he was willing to endanger troop transports in order to save cargo ships, he would have been instantly removed from command.

PROTECTION OF SHIPPING—THE CONVOY SYSTEM.

Germany's declaration of unrestricted submarine warfare, beginning February 1, 1917; its announcement that neutral as well as belligerent vessels entered the "barred zones" would be sunk without warning, made the protection of our shipping the immediate duty. All possible methods to this end were given prompt consideration—the arming of merchant ships, the convoy system, and every other measure that could be suggested. The General Board, in its special report submitted February 4, 1917, the day after the breaking off of relations with Germany, urged that we "arrange, as soon as possible, plans of cooperation with the naval forces of the Allies for the joint protection of trans-Atlantic commerce," as well as for "offensive naval operations against the common enemy." While it was realized that these joint methods could not be put into effect until after we had declared war; and that the convoy system could not be made generally effective until it had been adopted by Great Britain, France and Italy, the General Board, in response to my letter of March 20, that is before we entered the war, regarding "protection of merchant shipping" in its report submitted the same day placed first among its recommendations:

(a) Escort vessels to deep water from our ports and similarly from deep water to our ports.

(b) Arrange with British and French Governments for the convoy of our merchant ships through the barred zone.

Thus it will be seen, the convoy system was being considered by the Navy Department before we had determined to send Admiral Sims to Europe.

The President was among the first to suggest convoy, and in my brief conversation with Admiral Sims previous to his departure, I mentioned to the Admiral that various measures had been suggested, and the President was in favor of convoying ships. I myself favored convoy, though some of our leading naval authorities had pointed out the many difficulties it involved and the fact that, after three years of war, the British Navy, after considering it time and again had practically rejected the system.

ARMING OF MERCHANT VESSELS.

Immediately after the declaration of unrestricted submarine warfare, the President decided—and in this he was supported by practically all our naval authorities—that American vessels should be armed for protection against submarine attack, and Congress, in response to his message, took up the question, and, though a handful of Senators by filibustering prevented the formal adoption of the resolution, Congress by an overwhelming majority expressed its approval.

The arming of merchantmen was, in fact, about the only measure of protection we could put into effect before Congress had declared the existence of a state of war. Preparing for this task, the Navy Department had ordered from the fleet, then in Cuban waters, a number of gun crews, the guns were ready, and when the President, on March 12, ordered the arming of merchant ships the work was immediately begun, and within three days the first vessel armed sailed from New York, equipped with naval guns, manned by expert gunners. Whatever may have been the experience of other nations, this policy proved a success, so far as American shipping was concerned. Though vessels of slow speed, as many of these vessels formed easy marks for the submarine, in the first three months of our participation in the war—April 6 to July 6, 1917—we lost only six armed vessels, four of which were slow tankers, though this was the very height of the submarine warfare, when the total sinkings ranged from 500,000 to 800,000 tons a month. During these three months when the allied sinkings amounted to over 2,000,000 tons, our losses in armed ships were only 22,083 tons. Of the 384 American merchant vessels armed during the war, the records show that only 31 were sunk by submarines, and 193 submarine attacks were successfully repelled. Though no one ever regarded arming as complete protection against submarines, the facts given above are sufficient evidence of its value.

CONVOY SYSTEM BEING CONSIDERED BEFORE SIMS WENT TO EUROPE.

Admiral Badger has told you that in March, previous to Admiral Sims's departure for Europe, the General Board had recommended the convoy system; and this was in response to my letter of March 20, 1917, written at the instance of the President, who, as I said, directed me to "call upon the General Board to outline the measures that the Navy can employ for the most effective protection of the

merchant shipping to European ports, in addition to the armed guards that have already been undertaken."

That letter follows:

NAVY DEPARTMENT,
Washington, March 20, 1917.

Confidential.

To: The General Board.

Subject: Protection of American shipping.

1. The President directs me to call upon the General Board to outline the measures that the Navy can employ for the most effective protection of the merchant shipping to European ports, in addition to the armed guards that have already been undertaken. It is desired that every character of protection to this merchant shipping be considered by the board, and recommendations be made as to what additional agencies can be employed to protect American lives and American shipping.

Always insisting upon that, from the beginning.

2. This specific question—the fullest and most ample protection of this shipping, is the immediate problem committed to the Navy, and its duty to spare no effort or expense for such protection is imperative, and it is to the answer of this pressing problem that the recommendations of the General Board should apply.

3. Expedite report and embody specific recommendations.

JOSEPHUS DANIELS.

The General Board replied the same day—that is the way we delayed things—as follows:

MARCH 20, 1917.

G. B. No. 425-A.

(Serial No. 689.)

Confidential.

From: Senior member present.

To: Secretary of the Navy.

Subject: Protection of American shipping.

Reference: Secretary of the Navy's confidential letter, March 20, 1917.

1. Of the measures advocated by the General Board in its letter of February 4, 1917, G. B. No. 425, Serial No. 666, especial attention is invited to the following which bear directly upon the protection of our commerce in transit between the United States and Europe.

(a) Escort vessels to deep water from our ports and similarly from deep water to our ports.

(b) Arrange with British and French Governments for the convoy of our merchant ships through the barred zones.

(c) Merchant ships to proceed on high seas from points of leaving and receiving escorts, depending upon their guns for protection and upon changes of course to follow alternate routes.

(d) Arrange with British and French Governments a code of signals to be used in directing merchant ships as to routes to be followed and points of meeting escorts.

(e) Establish a patrol of the Atlantic coast.

(f) Recruit up to the limit allowed by law for emergencies in order to provide crews for patrols and auxiliaries, and fill battleship complements which have been depleted to supply gun crews to merchant ships.

2. In order to obtain what the General Board regards as the greatest measure of protection to American lives and American shipping on the high seas the General Board invites attention to its letter of March 20, 1917, G. B. No. 425, Serial No. 688, and to its previous letters of February 6, 1917, G. B. No. 425-1, Serial No. 553-b; February 17, 1917, G. B. No. 425-1, Serial No. 672; March 17, 1917, G. B. No. 425, Serial No. 683, on the same subject.

CHAS. J. BADGER.

In its special report of April 5, 1917, the day before war was declared, entitled "Assistance that United States can give Allies upon declaration of war," the General Board suggested, among the measures to be considered:

(a) Protect shipping proceeding to and from our ports from submarine or other attack.

(d) Should United States troops be sent to Europe, it will be necessary to escort the transports from shore to shore.

You see, even then, the General Board, in compliance with the policy of the time, was placing the extreme emphasis upon our troops. If we sent troops, they should be escorted from shore to shore; never any risk for them that could possibly be prevented. [Continuing reading:]

At present we are short of transports and convoying vessels, and cooperation in this duty with the Allies would be necessary.

(g) Mobilize the shipbuilding industries, both commercial and governmental, so that the energies of the Nation be extended in the directions needed to provide vessels to combat submarines, to escort merchant shipping, to replace shipping destroyed, and for other necessary additions to the fleet.

In another special report made the same day, April 5, recommending the detail of a commission of officers to Great Britain and France, the General Board recited, among the main points on which information was desired:

(e) Methods of patrol, escort, and convoy for the protection of both merchant shipping and naval forces against submarine and mine menace.

(h) Best methods and manner of cooperation and nature of service to be rendered by our forces, particularly in escorting merchant shipping.

The convoy system, as will be seen, was under consideration by the Navy Department before it was ever decided to send Sims to Europe. That was one of the things regarding which he was to get us full information.

BRITISH REGARDED "DISPERSION" AS BEST POLICY.

Admiral Sims did, soon after his arrival, inform us in detail regarding the methods in use by the British Admiralty. This disclosed that the Admiralty had not adopted the convoy system but "after trying various methods of controlling shipping," believed "the best policy to be one of dispersion." In his letter of April 19, 1917, his first mail report from London, Admiral Sims said:

Considerable criticism has been, and still is, concentrated upon the Admiralty for not taking more effective steps and for failing to produce more substantial and visible results. One of the principal demands is for convoys of merchant shipping and more definite and real protection in the war zone.

"It is insistently asked (was asked by myself)," he reported, "why shipping is not directed to and concentrated at various rendezvous and from these convoyed through the dangerous areas. The answer is the same—the area is too large; the necessary vessels are not available." He set forth in detail the many difficulties that would be encountered in inaugurating the system, the strenuous objection of merchant masters to convoy, and stated:

After trying various methods of controlling shipping, the Admiralty now believes the best policy to be one of dispersion.

DECLARED IMPOSSIBLE BY MERCHANT MASTERS AT ADMIRALTY CONFERENCE, FEBRUARY 23.

In his magazine article in the *World's Work* for October, 1919, describing his conversation on the subject with the first sea lord of the Admiralty, Admiral Sims says:

"The merchantmen themselves are the chief obstacle to the convoy," said Admiral Jellicoe. "We have discussed it with them many times and they declare that it is impossible. It is all right for war vessels to maneuver in close formation, they say.

for we spend our time practising in those formations, and so they think that it is second nature to us. But they say that they can not do it. They particularly reject the idea that when in formation they can maneuver their ships in the fog or at night without lights. They believe that they would lose more ships through collisions than the submarine would sink."

I was told that the whole subject had been completely thrashed out at a meeting which had been held at the Admiralty on February 23, 1917, about six weeks before America had entered the war. At that time 10 masters of merchant ships had met Admiral Jellicoe and other members of the Admiralty and had discussed the convoy proposition at length. In laying the matter before those experienced seamen, Admiral Jellicoe emphasized the necessity of good station keeping, and he described the close formation which the vessels would have to maintain. It would be necessary for the ships to keep together, he explained, otherwise the submarines could pick off the stragglers. He asked the masters whether it would be possible for 8 merchant ships, with a speed which varied perhaps 2 knots, to keep station in line ahead (that is, in single file or column) 500 yards apart, and sail in 2 columns down the channel.

"It would be absolutely impossible," the 10 masters replied, almost in chorus.

TRIED ONE EXPERIMENTAL CONVOY IN MAY.

Describing how the Admiralty, though still doubtful, decided to try the plan by one experimental convoy in May, Admiral Sims says:

On April 30 I received a message from Admiral Jellicoe asking me to come to the Admiralty. When I arrived he said that the projected study of the convoy system had been made and he handed me a copy of it. It had been decided to send one experimental convoy from Gibraltar. The Admiralty, he added, had not yet definitely decided that the convoy system should be adopted, but there was every intention of giving it a thorough and fair trial. That same evening at dinner I met Mr. Lloyd George, Sir Edward Carson, and Lord Milner, and once more discussed with them the whole convoy idea. I found the prime minister especially favorable to the plan. In general, civilians were more favorably disposed toward the convoy than seamen, because they were less familiar with the nautical and shipping difficulties involved.

Naval officers were immediately sent to Gibraltar to instruct the merchant masters in the details of assembling and conducting vessels. Eight-knot ships were selected for the experiment, and a number of destroyers were assigned for their protection. The merchant captains, as was to be expected, regarded the whole enterprise suspiciously, but entered into it with the proper spirit.

On May 20 that first convoy arrived at its English destination in perfect condition. The success with which it made the voyage disproved all the pessimistic opinions which the merchant sailors had entertained about themselves.

* * * * *

On May 21 the British Admiralty, now entirely convinced, voted to adopt the convoy system for all merchant shipping. Not long afterwards the second convoy arrived safely from Hampton Roads. Then other convoys began to put in from Scandinavian ports. On July 21 I was able definitely to report to Washington that "the success of the convoys so far brought in shows that the system will defeat the submarine campaign if applied generally and in time."

IN EXPERIMENTAL STAGE UNTIL JULY.

It will be observed from Admiral Sims's own account that it was not until July 21 that he was "able definitely to report to Washington" that the "convoy so far brought in" showed that the system had proved a success.

Admiral Sims's testimony and the dispatches he read might give you an idea that the convoy system was adopted by Great Britain in May, and that, in some way or other, the department "resisted" the system and prevented it from being put into effect until months later. The facts are that in the latter part of May the British dispatched one convoy, just to see if the plan would work, and that up to the end of June the system was still in its experimental stage.

That this was the case is shown by the following cablegram which Admiral Sims sent from London June 22:

To: Secretary of the Navy.
Sent: June 22.

The British Admiralty have now adopted the convoy system and will put it into effect as fast as ships can be obtained for high-sea convoy against raiders and destroyers for escort duty in submarine zone. As previously reported, convoys are in successful operation from Mediterranean and Hampton Roads. Plans are in hand for total of eight convoys a week, as follows: Two from Gibraltar, two from Hampton Roads, two or three from New York, one from Canada, the latter preferably being combined with the New York convoys. One a week from New York will be put into operation as soon as possible with British cruisers in absence of our support. I again urgently advise our full support assisting and cooperating in assembly of convoys and furnishing one cruiser or reserve battleship a week for high-sea escort. Reserve battleships are admirably suited for this duty, which will not interfere with personnel training, for which, I understand, they are now being used.

CRUISERS FURNISHED, CONVOY SYSTEM PUT INTO EFFECT.

A week after this dispatch was received I sent the following cablegram to Admiral Sims, stating that the department agreed to the Admiralty's request and would assign seven cruisers for convoy duty:

JUNE 30, 1917.

To: Vice Admiral Sims.

44. Referring to your previous cables. The department recognizes the urgent necessity of sending to European waters all antisubmarine craft possible and is using every effort to meet the demand. Five destroyers from Asiatic waters have been ordered to duty in European waters and will sail about August 1.

The department will meet the Admiralty's desire for the assistance of seven cruisers for convoy duty.

The following method for routing merchant shipping across the Atlantic is suggested for discussion with the Admiralty: That the Admiralty predict for each week ahead and nominate the days on which it will escort ships through the danger zone. That the Admiralty select the rendezvous at which it will meet and escort merchant shipping. That their instructions be cabled to their agents here. That the United States authorities, working in conjunction with the British agents here from the same office, direct all belligerent shipping to the rendezvous to fit the dates predicted by the Admiralty. That the make-up of the convoy at the points of rendezvous be arranged for by classifying ships according to speed, the alphabetical marking not to be evident to the enemy. That the United States authorities appoint the rendezvous for incoming vessels to United States ports in case the enemy submarine efforts on this side render escort in these waters a necessity.

It is believed this method has the advantage of not slowing up the flow of merchant tonnage across the Atlantic, while, except for protection against raiders, it meets most of the requirements of continuous convoy. It has the further advantage of making less demands on the allied coal supplies in European waters.

As Capt. Pratt has told you, we put the convoy system into effect in toto on July 5, and on that date Admiral Sims was informed that seven cruisers of the *Denver* class had been assigned to this duty, though we were convinced the plan we suggested would result in a better organization of transatlantic shipping than that in use. Admiral Sims's opposition to any change, though it might be an improvement, in the British system of routing shipping, to avoid delay we adopted Sims's recommendations and gave our full cooperation.

SIMS STILL WRITING OF ITS DIFFICULTIES JUNE 29.

As late as June 29, 1917, Admiral Sims wrote to me:

The difficulties confronting the convoy system are, of course, considerable. They are primarily involved in the widely dispersed ports of origin of merchant shipping, the difficulty of communication by cable, the time involved by communications by

mail, and the difficulties of obtaining a cooperation and coordination between allied Governments.

As reported by cable dispatch, the British Government has definitely reached the decision to put the convoy system into operation as far as its ability goes.

This was June 29, 1917.

Convoys from Hampton Roads, Canada, Mediterranean, and Scandinavian countries are already in operation. Convoys from New York will be put in operation as soon as ships are available. The British Navy is already strained beyond its capacity, and I therefore urgently recommend that we cooperate at least to the extent of handling convoys from New York.

Before this letter was received we had ordered cruisers to ocean escort duty and put the system into effect.

ONLY A FEW CONVOYS UP TO THAT TIME.

Admiral Sims's dispatches quoted above would give the idea that convoys had been for weeks operating regularly from the Mediterranean and America. But Admiral Niblack, who during most of the war was in charge of our forces at Gibraltar, through which one-fourth of the allied tonnage of the world passed, has told you that, while the first experimental convoy was sent from that port in May, it was not until July 27, 22 days after the United States had adopted the convoy system, that the next first regular convoy was dispatched from Gibraltar. He shows that it was not until July 22, 1917, that the Admiralty order was issued applying the convoy system to the Mediterranean.

Admiral Wilson, who was from August to November 1, 1917, in command at Gibraltar, and from November 1 until the end of the war in command of our forces in France, told you that, in his opinion, we "adopted the convoy plan in ample time." I quote the following from his testimony:

The CHAIRMAN. Do you not think if we had adopted the convoy system earlier it would have had a great effect in shortening the war?

Admiral WILSON. We adopted the convoy system in ample time, I think. I was in Gibraltar soon after the convoy system started, and do you know what the convoy from Gibraltar was? They went out sometimes with 20 or 30 ships for England. One little Coast Guard cutter at times was the sea escort for the convoy. When you have such small vessels as that, all that the escort did was to navigate the convoy up the coast.

The CHAIRMAN. But the testimony of others is that the convoy system was a very important system.

Admiral WILSON. Absolutely.

The CHAIRMAN. And that it had a great deal to do with the winning of the war.

Admiral WILSON. Absolutely.

The CHAIRMAN. And the testimony is that it was not adopted as soon as it might have been?

Admiral WILSON. How about England? She did not adopt it until long after the war started.

UNITED STATES VESSELS MADE CONVOY SYSTEM POSSIBLE.

Admiral Niblack has pointed out that, with the slow-moving cargo ships, "the virtue of the convoy system was entirely dependent upon the efficiency of the danger-zone escort at one of the terminal ports and not in the accompanying vessels during the voyage." The principal function, he said, of the man-of-war ocean escort was "to regulate the radio communication and prevent the ships from straggling."

United States destroyers were engaged in escorting convoys through the danger zone from the time the very first convoys were sent across the Atlantic. I wish to emphasize that—that United States destroyers were engaged in escorting convoys through the danger zone from the time the very first convoys were sent across the Atlantic. Admiral Sims himself has shown that it was the vessels we sent to Europe which made possible the putting into effect and successful operation of the convoy system. In the *World's Work* for October, 1919 (p. 617), Admiral Sims says:

I do not wish to say that the convoy would not have been established had we not sent the destroyers for that purpose, yet I do not see how it could have been established in any complete and systematic way at such an early date. And we furnished other ships than destroyers, for besides providing what I have called the modern convoy—protecting the compact mass of vessels from submarines—it was necessary also to furnish escorts after the old Napoleonic plan. It was the business of the destroyers to conduct the merchantmen only through the submarine zone. They did not take them the whole distance across the ocean—for there was little danger of submarine attack until the ships reached the infested waters. This would have been impossible in any case with the limited number of destroyers.

But from the time the convoys left the home port, say New York or Hampton Roads, there was the possibility of the same kind of attack as that to which convoys were subjected in Nelsonian days—that is, from raiders or cruisers. We always feared that German cruisers or raiders of the *Moewe* type might escape into the ocean and attack these merchant ships, and we therefore had to escort them across the ocean with battleships and cruisers, just as they did a century ago. The British did not have ships enough available for this purpose, and here again the American Navy was able to supply the lack; for we had a number of predreadnaughts and cruisers that were ideally adapted to this kind of work.

ALL SIMS'S CHARGES INCONSIDERABLE IN COMPARISON WITH GREAT WORK ACCOMPLISHED.

Mr. Chairman, in view of the fact that our destroyers were at work in escort duty in British waters as soon as the convoys were started, that it was our vessels at Queenstown, Brest, and Gibraltar, our cruisers going out with groups of ships from New York, Hampton Roads, and other points, that made the convoy-system possible, how can you credit Admiral Sims's charge that the Navy Department "resisted" the convoy system and delayed its adoption for months? There were differences of opinion among some of our naval authorities, as there were in the British Admiralty, as to the convoy system. There was in this country the same difficulty that was encountered in England in getting shipowners to sail their vessels in convoy, and this difficulty was increased in America by the fact that the Government at that time had no control over privately owned shipping. Some of our officers were not inclined to abandon the policy of armed ships sailing singly, which had with us proved its success, until the convoy system had passed the experimental stage.

But all the delays that Admiral Sims alleges—the cablegrams that he says made him "want to jump overboard"—all these together did not prevent or delay for any appreciable time the adoption or operation of the convoy system. Admiral Sims has told you how strenuously he urged its adoption by the British Admiralty. He was the representative of the Navy Department, and he could not have done this if the Navy Department had disapproved it. He was voicing the same views that weeks before had been expressed by the President and the General Board.

UNITED STATES VESSELS PERFORMED LARGE PROPORTION OF CONVOY DUTY.

In the operation of the convoy system United States vessels performed a service far in excess of their relative numbers in comparison with those of the Allies. The most important lines of traffic were from America to England and France, and from the Mediterranean to England, Queenstown, Brest, and Gibraltar were the bases for the escort ships that gave vital protection to the most important ocean traffic, and it was from these ports that the principal American forces operated.

Gibraltar gives, perhaps, the best example of the amount of duty performed by United States vessels in escorting cargo ships. Gibraltar, Admiral Niblack told you, "became the principal convoy port of the world, with about one-quarter of all the allied tonnage touching there to be formed up into cargoes in every direction." He was on the spot and he testified as follows—

The CHAIRMAN. This is a quotation from his testimony before this committee?

Secretary DANIELS. Yes; before this committee. This is what he said:

The date of the inauguration of the convoy system in the Mediterranean is when the British admiral on July 22, 1917, telegraphed to Gibraltar to commence collecting British and allied cargo ships with speed of between 7 and 11 knots bound for ports in the United Kingdom with a view to forming them into convoys, and on the 27th of July, 1917, the first regular convoy consisting of 14 ships with an ocean escort sailed from Gibraltar for the east coast of England, and thereafter these convoys sailed every four days from Gibraltar for ports on the east and west coast of England alternately, and sailed from England for Gibraltar at regular periods from Falmouth and Milford-haven.

The first American man of war for escort duty arrived in Gibraltar on August 6. As fast as our ships arrived they were assigned to duty with allied vessels as escorts to convoys and as danger zone escorts. The American ships differed from other nationalities based on Gibraltar in that other nationalities were employed almost exclusively in Mediterranean escort work, and Malta was the headquarters of the allied Mediterranean escort forces, whereas our forces undertook also practically all escort work in the Atlantic between Gibraltar and the United Kingdom. For instance, of the 225 convoys which sailed between Gibraltar and the United Kingdom during the entire war, 200 of them, of almost 90 per cent, totaling 4,629 ships and representing 12,000,000 gross tons, were escorted both ways solely by American escort ships from our forces based on Gibraltar. This point is important because it made my headquarters, Gibraltar rather than Malta.

There was a further reason for my being at Gibraltar because of the enormous number of unescorted American ships which arrived singly in Gibraltar from the United States. This has to do with the importance also of each ship having an armed guard on board, as this whole traffic was independent of the convoy system.

The total number of ships convoyed in local Mediterranean traffic by American forces amounted to about 4,245 ships bound for Mediterranean and Far Eastern ports, supplying the American Army through Marseilles, French forces in North Africa, allied forces at Saloniki, British forces in Egypt and Palestine, and the entire supply of Italy.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until to-morrow, Friday, May 14, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

FRIDAY, MAY 14, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in room 235 Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Will you proceed, Mr. Secretary?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. The outstanding service the Navy rendered during the World War was with reference to the transportation and safety of over 2,000,000 American soldiers to France. The arrangements for that service were jointly made in Washington by the Secretaries of War and Navy and trusted officers of both services. The carrying out of the plans was intrusted on this side to officers whose wise execution can not be too highly commended. The Army and Navy worked on this great task with the harmony and cooperation which characterized the two arms of the Republic's military service in all the varied lines of duty intrusted to them. As to the appreciation of the part the Navy played in this great undertaking greatly carried out, the officers of the Army have given generous and appreciated commendation.

Every transport carrying troops to Europe was convoyed. The 2,000,000 men arrived safely because of wise plans faithfully executed. As evidence of the early, I should say the immediate, whole-hearted work of the Navy in this greatest task of the Navy during the World War, I append this correspondence showing that in the very first days of the war the Navy's performance of duty was recognized:

JULY 3, 1917.

HON. JOSEPHUS DANIELS,
Secretary of the Navy.

MY DEAR MR. SECRETARY: Word has just come to the War Department that the last ships conveying Gen. Pershing's expeditionary force to France arrived safe to-day. As you know, the Navy assumed the responsibility for the safety of these ships on the sea and through the danger zone.

The ships themselves and their convoys were in the hands of the Navy, and now that they have arrived, and carried, without the loss of a man, our soldiers who are the first to represent America in the battle for democracy, I beg leave to tender to you, to the admiral, and to the Navy, the hearty thanks of the War Department and of the Army.

This splendid achievement is an auspicious beginning, and it has been characterized throughout by the most cordial and effective cooperation between the two military services.

NEWTON D. BAKER.

JULY 4, 1917.

HON. NEWTON D. BAKER,
Secretary of War.

MY DEAR MR. SECRETARY: The Navy accepts the thanks and gratitude of the Army as an expression of fraternal esteem rather than as any acknowledgement of sole achievement. The movement of the expeditionary forces, carried out with such complete success, was planned in joint conferences, and goes to the people as a proof of the effectiveness that lies in intimate cooperation between the two great military branches of the Government.

This generous concentration of activities is as thrilling a thing to me as the safe passage of our transports through the ocean lanes. With Army and Navy thinking as one, planning as one, fighting as one, the great purpose of America is expressed in terms of invincibility. In behalf of the men whose courage gave safe conduct to courage, I send to you the greetings of the Navy, awaiting in full confidence for the day when the valour of your soldiers will write new and splendid chapters in the heroic history of our liberty-loving land. You, who have shared with me the anxiety of these days of intolerable suspense, will know the full and happy heart out of which I write.

JOSEPHUS DANIELS.

WHAT GEN. PERSHING THOUGHT OF THE NAVY'S SERVICE.

Gen. John J. Pershing, writing under date of April 21, 1919, said:

We fully realize that had it not been for the Navy, who kept watch and guard night and day over our transport fleet, the American effort in France would never have been successful. The Navy's assistance was whole hearted and arduous, and was always given in a most generous spirit of cooperation.

Pershing added that "This backing and cordial cooperation existed throughout the war," from April 6, 1917, until the American Expeditionary Forces were brought home.

The commanding officer of the Army in France does not limit the Navy's effort or achievement to any particular period of the war, nor reflect upon its whole-hearted service "throughout the war." It is left for Rear Admiral Sims to unjustly, and without shadow of foundation, charge the Navy Department with responsibility for the loss of life and cargoes and with prolonging the war because the department at Washington did not instantly accept every recommendation he made and abdicate in his favor.

The CHAIRMAN. Will you please put in the record the whole of that letter of Gen. Pershing?

Secretary DANIELS. The whole of that letter; yes. Now, I come to the Naval Overseas Transportation Service.

Navy manned and operated 378 cargo vessels.

Transported 6,000,000 tons of supplies.

The Navy, during the war period, manned and operated a total of 450 cargo vessels, of 3,115,858 tons (dead weight). At the time of the armistice more than 100 additional vessels had been assigned to the Naval Overseas Transportation Service, which we were preparing to man, and many of them were in process of being taken over by the Navy. The largest number of vessels in operation by the N. O. T. S. at any one time was 378, totaling 2,397,578 tons. The aggregate tonnage of vessels assigned to the N. O. T. S. was 4,019,293 tons.

The magnitude of this service can be realized when it is stated that the Naval Overseas Transportation Service comprised more vessels than were in the prewar fleets of the Hamburg-American, North German Lloyd, and Cunard lines combined, and transported approximately 6,000,000 tons of supplies, munitions, and materials for the

Army, Navy, and Shipping Board. To man this large fleet required nearly 5,000 officers and 30,000 men, and many thousands more were being trained for this service when hostilities ended, as the Navy was preparing to man the hundreds of vessels under construction by the Shipping Board, many of which were nearing completion.

The Navy's big work in cargo transportation was the result of war demands, and was developed and expanded to meet the emergency.

What later became known as the Naval Overseas Transportation Service really dates back to March, 1917, when the department decided upon the policy of arming merchant ships for protection against submarine attacks, and the first Navy gun crews were ordered on March 12 to the steamship *St. Louis* and steamship *Manchuria*. In all, 384 cargo ships had crews furnished them by the Navy for manning guns and acting as signalmen and radio operators. Later, when the ships were taken over by the Navy, these armed guards were merged with the regular crews.

The next step in the formation of this service was the department's order of May 7, 1917, directing that all naval auxiliaries, which had previously been manned by civilian officers and crews, be placed on a naval status and manned by enlisted men. In the meantime every effort was being made by the department to enroll all desirable officers and men of the merchant service in the Naval Reserve, and considerable progress had been made along this line.

By this time there had been taken over and manned by Navy crews 16 small German vessels carrying cargo for the Navy.

The necessity of having Navy crews on all vessels passing through the war zone had frequently been urged upon the Shipping Board on account of difficulty with civilian crews in enforcing discipline and compliance with war regulations; and on December 15, 1917, official permission was given to take over the first Shipping Board ship, the *Deepwater*. In the meantime the Navy had taken over 6 large oil tankers. In December it had also taken over several vessels for the Army account, and the same month 29 lake vessels were taken over and fitted out as tenders to the mine-laying squadron.

By the end of 1917 the Navy had already acquired a large fleet of cargo ships, and the immediate prospect of having to greatly increase this number made it necessary to establish a new organization. The department issued an order January 9, 1918, establishing the Naval Overseas Transportation Service, with headquarters in the Navy Department and branches in all shipping ports to which vessels were to be assigned. Certain offices were created and their duties defined. The first Naval Overseas Transportation Service fleet was composed of 73 vessels to be operated with full Navy crews, of which 16 were for Army account, and 52 for Navy account. Five additional vessels were named to be placed in commission as soon as possible.

The organization proved to be smooth running and effective, and the fleet rapidly increased in numbers. The success and efficiency of this method of operating cargo vessels was so apparent that the Navy was requested finally, by both the Army and the Shipping Board, to take over and man all these vessels in military or supply service.

During the war there were operated by the Naval Overseas Transportation Service 450 vessels, with a tonnage of 3,115,858 dead-

weight tons. At the time of the armistice more than 100 additional vessels were in process of being taken over, making a total of 4,019,293 tons. The largest number of vessels in actual operation at one time was 378, with a capacity of 2,397,578 tons.

Cargo vessels manned and operated by the Navy carried overseas approximately 6,000,000 tons of supplies for the Army, Navy, and Shipping Board, divided as follows:

For the American Expeditionary Force, 3,102,462 tons of supplies; for naval bases, 1,000,000 tons of supplies, exclusive of coal; for American Fleet and other war purposes, 1,348,177 tons of coal; for Army and Navy, 704,000 tons of fuel oil and gasoline; for the Allies, 359,627 tons of food.

All the mines used in the North Sea barrage, 82,000 complete units with anchors, were carried on N. O. T. S. vessels.

Ninety-six thousand tons of coal were transported from Cardiff to Brest for the American Expeditionary Force.

Fifteen thousand animals were transported in October and November, 1918.

New England's fuel shortage was alleviated by N. O. T. S. vessels, which hauled and released large quantities of coal stored at naval supply bases on the Atlantic Coast.

The British Government was assisted in maintaining an adequate coal supply at Halifax, Bermuda, Trinidad, and St. Lucia. Billet steel was carried for the French Government. Military stores were transported for the Italian Government.

The personnel necessary to operate this great fleet at the time of the armistice consisted of 4,647 officers and 29,175 men as follows:

	Officers.	Men.
Afloat.....	4,158	28,047
Ashore.....	514	1,128

Almost the entire personnel of the N. O. T. S. enlisted during the war, about 18,000 in the regular Navy and 11,000 in the reserves. Of the commissioned officers, only 12 were regulars.

As the number of licensed officers in the merchant service was only a small proportion of those needed, it was necessary to train officers. To this end deck officer schools were established by the Navy at Pelham Bay Training Camp, N. Y., and at Municipal Pier, Chicago, and an engineer officer school at Stevens Institute, Hoboken, N. J. There was also established a school for turbine engineers at Carnegie Institute, Pittsburgh. Nearly four-fifths of the N. O. T. S. officers were graduates of these schools and got their first sea experience during the war.

To operate successfully the various necessary activities in connection with the Naval Overseas Transportation Service there was established in each port an organization competent to handle personnel, supplies and repairs. Storage warehouses, piers, docking and repair facilities on a large scale were required, as well as tow boats and barges. Supplies of all kinds, including coal, fuel oil, repair material, etc., had to be constantly kept on hand so that no vessel need be detained in port beyond the loading period. As nearly every vessel taken over, whether new or old had to be remodelled in many essen-

tial features to meet Navy requirements, it will be seen that the local organization had no easy task, particularly as these changes were made, so far as possible, without delaying the loading of the vessel.

In view of the magnitude of the task and the many obstacles to be overcome, the Naval Overseas Transportation Service made a record that would be difficult to equal.

The manning of cargo vessels was a new service for the Navy and one not previously contemplated, and the creation of this vast fleet and its operation with such efficiency and success was one of the notable achievements of the war. I have here a list of the vessels in the Naval Overseas Transportation Service, and it is one of the most remarkable services that the Navy performed, and it performed it with such efficiency as to win the commendation and the admiration of all the services, and everybody who knew anything about it.

Senator TRAMMELL. N. O. T. S. means Naval Overseas Transportation Service?

Secretary DANIELS. Naval Overseas Transportation Service; something that never had been conceived by any naval officer in the past that the Navy would be called upon to do.

ALLEGED PROLONGATION OF THE WAR AND ALLEGED UNNECESSARY LOSS OF 5000,000 LIVES.

Early in his testimony Admiral Sims furnished the committee with an "Estimate of unnecessary loss of lives, tonnage, and wealth suffered by the allied cause and by the United States by dilatory policy of Navy Department during the first six months of the war."

I am quoting his words and not my own, because I wish to emphasize the fact that his words have no basis of foundation in fact whatever. He charges that due to the shortcomings of the United States Navy there was an unnecessary loss of 2,500,000 tons of shipping, resulting in postponing the end of the war "at least four months." Admiral Sims says:

The average loss of life per day to the Allies during the war was 3,000 men. This prolongation of the war, therefore, cost half a million lives, similarly, as the war cost the Allies \$100,000,000 a day on the average; this prolongation resulted in the unnecessary expenditure of \$15,000,000,000, of which at least one-third was expended by the United States directly or loaned to the Allies.

This is practically the only charge made by Admiral Sims of unfavorable results from the many alleged sins of omission and commission of the Navy Department. Practically all the rest of his statement of over 200,000 words is academic as regards the effect upon the war of what was alleged to be done or left undone. The charge of the pro-

longation of the war, however, is a definite and serious one; it is made with reckless disregard of the facts and the reasoning and statistics adduced in its support are those which one might expect to find in the fantastic tales of a Baron Munchausen or the statistics of a Colonel Mulberry Sellers.

Even in making the charge quoted above Admiral Sims disregards his own alleged facts. He gives the average loss of life per day to the Allies as 3,000 men, and figures that with the four months' prolongation this would result in a loss of half a million lives. The loss of 3,000 men a day for four months falls far short of half a million even if the months were all of 31 days; but of course half a million sounds more impressive than the figure which would have been arrived at by correct arithmetic. In support of his charge Admiral Sims says:

The tonnage losses of 1917 made it impossible at the time to transport any considerable American Army and, at the same time, continue the absolutely essential military supplies and food for the civil populations of the Allies' countries. It therefore became necessary to limit the number of American troops that could be sent abroad during the first year to an average of approximately 25,000 men per month. If the additional million and a half tons sunk unnecessarily in 1917 had been saved by the prompt cooperation of our Navy, the number of American soldiers sent to France could have been doubled or trebled. If the tonnage had been available and the additional American troops had been sent to France, and the new drafts called more promptly in this country, America could have had a million men in France by March, 1918, instead of 300,000.

Admiral Sims then goes on to reason that if there had been a million American soldiers in France by March, 1918, the war would have ended four months sooner. It is not necessary to follow him into this realm of speculation, nor is it necessary so far as his statement is concerned, to go into the real reasons, not mentioned by him, why there were not a million American soldiers in France by March 1, 1918.

Admiral Sims above ascribed this wholly to the tonnage losses of 1917, which he claimed made it "impossible to transport any considerable American Army," etc. He does this because these alleged tonnage losses of 1917 are ascribed by him wholly (though erroneously) to the shortcomings of the American Navy, thus completing the chain by which he attempts to fix on the American Navy blame for four months prolongation of the war. It is not necessary to wander far into the realm of statistics or technical questions to show the absolute fallacy of Admiral Sims's claim outlined above. He informed the committee that the net tonnage available for the Allies May 1, 1917, was 27,000,000 tons. It is a matter of common knowledge that on May 1, 1918, the tonnage was less than on May 1, 1917. Testimony given by Admiral Sims would indicate that the net loss during the year was about 2,000,000 tons. This is probably a sufficiently close estimate for practical purposes. Now then, owing to the tonnage losses of 1917 and the early part of 1918, the net tonnage available to the Allies had been reduced from 27,000,000 on May 1, 1917, to 25,000,000 on May 1, 1918. Yet it is a matter of common knowledge admitted by Admiral Sims, that in the spring of 1918, American troops were transported to France at the rate of nearly 300,000 a month, or more than ten times the rate to which he said transportation had been restricted in 1917 because of the destruction of tonnage. This simple fact refutes absolutely Admiral Sims's statement that the tonnage losses of 1917 made it "impossible to transport any considerable American Army" and "necessary to limit the number

of American troops that could be sent abroad during the first year to an average of approximately 25,000 men per month."

There might be some excuse for Admiral Sims thinking, in 1917, that things were impossible which were afterwards done in 1918. Certainly he has no excuse and no warrant of facts for charging in 1920 that things were impossible in 1917 because of the reduction of tonnage which were done in 1918 with the reduced tonnage. They were done with difficulty, it is true, but they were done.

While it is presumably without the scope of this committee to go into questions affecting the Army and the many very good reasons having no connection with tonnage, why there were not a million American soldiers in France on March 1, 1918, in view of the specific statement of Admiral Sims ascribing this entirely to lack of tonnage, and the fact that in cross-examination he said he knew nothing about Army matters or the conditions in the Army, and based his allegations entirely upon reports of distinguished Army officers as to shortage of tonnage—

Senator PITTMAN. Excuse me, Mr. Secretary; you attribute there to Admiral Sims's testimony that he bases his allegations upon reports of distinguished Army officers. That does not agree with my recollection of his testimony, which I will call your attention to on cross-examination.

Secretary DANIELS. All right.

Senator PITTMAN. I think he limits his opinion on the subject to the official report of Gen. Pershing.

Secretary DANIELS. Yes, he did; that is right. He attributed it entirely to that. I ought to have said "a distinguished Army officer." I will change it to that, "a distinguished Army officer," and say, in view of the specific statement of Admiral Sims ascribing this entirely to lack of tonnage, and the fact that in cross-examination he said he knew nothing about Army matters or the conditions in the Army, and based his allegations entirely upon the report of a distinguished Army officer as to shortage of tonnage, I may remark that as a result of constant conference and intimate association during the critical time of the war, between the Secretaries of War and Navy and high responsible officers of the two departments, I did have knowledge of the difficulties encountered and superbly overcome by the Army during that period. In the first place, the shipment of American troops to France in large numbers during 1917 and the greater part of 1918 was dependent entirely upon the allocation of tonnage to the United States from the Allies. The interned German vessels taken over by the Government and assigned to Army service were put in service by the end of 1917, and there was during 1918 a steady growth of Army and Navy transports under the American flag; but the transportation of men in large numbers up to the summer of 1918 was and could be possible only by the allocation of tonnage from the Allies.

The United States made every effort to increase its troop-carrying capacity by obtaining from the Allies available vessels suitable for this purpose and also the necessary cargo tonnage. Not until the development of the serious situation in March, 1918, however, were the Allies willing to allocate the necessary tonnage to the United States. The question of tonnage, however, was not the only factor

as regards the Army in France. To handle and supply the great American Army an enormous amount of work had to be done in France.

When we entered the war the ports and railroads of France were crowded with traffic and had fallen into disrepair. The turn around of transports and cargo vessels was at no time satisfactory during 1917, because of inadequate port and shore facilities, and it was only after the American Army had built new ports, warehouses, dock equipment, nearly a thousand miles of new railroad trackage, new switching facilities to crucial points, new repair shops and round-houses, and supplied new rolling stock that vital munitions and supplies could be landed and forwarded to the front for an army of any size. I wish to emphasize that as of the highest importance. By the spring of 1918 the enormous work undertaken by the Army in providing facilities essential to enable a large American Army to operate in France was showing results. The cargo-handling capacity in French ports available for us, for instance, had reached 10,000 tons per day in the spring of 1918; it was trebled before the armistice, reaching 30,000 tons per day.

My understanding is that, broadly speaking, there was always tonnage to carry men, munitions, and supplies as fast as they could be landed and forwarded to the front in France, and that only by extreme exertions was this done when the rush of troops came in April. Even had the Allies been willing to release the necessary tonnage earlier the port and inland transportation facilities would not have warranted our sending many more soldiers to France before March 1, 1918.

As a matter of fact, the American Army materially shortened the war. It got to the front as soon as it was humanly possible, not by chance, but as a result of careful plans involving complete cooperation between the Army and the Navy which was brilliantly carried out.

As regards the length of the war, Field Marshal Sir Douglas Haig, in a report made by him on April 8, 1919, said:

If the causes which determined the length of the recent contest are examined in the light of the accepted principles of war, it will be seen that the duration of the struggle was governed by and bore a direct relation to certain definite factors which are enumerated below.

In the first place—

He is speaking, of course, of Great Britain as well as the other Allies—

We were unprepared for war, or at any rate for a war of such magnitude.

Of his own country, he is now speaking.

We were deficient in both trained men and military material and, what was more important, had no machinery ready by which either men or material could be produced in anything approaching the requisite quantities.

Second, the consequence of our unpreparedness was that our armies were unable to intervene—

Listen to this, gentlemen—

The consequence of our unpreparedness was that our armies were unable to intervene either at the outset of the war or until nearly two years had elapsed in sufficient strength adequately to assist our allies.

A further cause adversely influencing the duration of the war on the western front during its later stages, and one following indirectly from that just stated, was the situation in other theaters. The military strength of Russia broke down in 1917 at

a critical period when had she been able to carry out her military engagements, the war might have been shortened by a year.

Thirdly, the Allies were handicapped in their task and the war thereby lengthened by the inherent difficulties always associated with the combined action of armies of separate nationalities, differing in speech and temperament, and not least important, in military organization, equipment and supply.

Finally, as indicated in the opening paragraph of this part of my dispatch, the huge numbers of men engaged on either side, whereby a continuous battle front was rapidly established from Switzerland to the sea, outflanking was made impossible and maneuver very difficult, necessitated the delivery of frontal attacks.

It will be observed, gentlemen, that Marshal Haig states specifically that the British armies were unable to intervene until nearly two years had elapsed "in sufficient strength adequately to assist our Allies." The war was over not two years, but 19 months after the United States entered it, and no man could deny that within 15 months after our entry, the American Army was in sufficient strength on the battle front "adequately to assist the Allies." Yet the American Army had to be transported and supplied across 3,000 miles of ocean in the face of a supreme effort of the German submarine, and then across the width of France, while Great Britain was within the sound of the German guns. Let me quote from the report of the Chief of Staff to the Secretary of War for the fiscal year ended June 30, 1919. The Chief of Staff of the Army says:

When German submarines appeared off the Atlantic coast with the obvious purpose of delaying our shipping program, pressure was brought to bear on the department, not only from within this country but from our Allies who were cooperating in furnishing the shipping, to modify the program by changing the embarkation points to Canada. Realizing that the German military authorities appreciated the inevitably decisive effect of the continuation of the shipping program and having entire confidence in the effectiveness of the measures adopted by the Navy to protect the convoys of our troops, I declined to accede to the suggestions that any steps be taken which would result in any retardation of our shipment of troops to France. It is of interest to note in this connection that no United States transport was sunk on an eastern voyage during the period referred to.

I have only touched briefly in the above upon matters affecting the Army, but I trust I have made clear what is the fact, what any thorough investigation will disclose to be the fact, and what history will record as the fact, that in the World War the American Army did not waste or lose a day in the stupendous task of bringing America's man power to bear decisively upon the western front, that the American Navy never in any respect failed the American Army in its cooperation and assistance in this great task and that neither the American Army nor the American Navy can be justly charged with responsibility for prolonging the war one day.

Having boldly claimed in his printed statement to the committee that it was "impossible" to transport troops, etc., in 1917 because of loss of tonnage, Admiral Sims later, under questioning, seemed to shift his ground by claiming that it was inexpedient to transport troops in 1917 because the destruction of tonnage going on rendered the future uncertain. He said, on March 3:

If we could have seen ahead a year, and could have been sure that we were going to arrive at a position where the increase in the building of tonnage surpassed the destruction, we could have taken the action in 1917 which we did take in March or April, 1918, and succeeding months, but which we would not have dared to take and which it would not have been prudent to take in 1917. I do not know whether that is clear or not.

It appears, then, that Admiral Sims, in cross-examination, modified his statement that it was "impossible" to transport troops in 1917 because of losses of tonnage, to a claim that it was not "prudent." That is a very different position. But Admiral Sims himself has refuted his claim of impossibility very completely. On March 3, in answering the question of the chairman, he said:

And, anyway, it seems to me that as we actually demonstrated, after the month of April, immediately after the month of April, 1918, that we could send over 300,000 a month and keep it up until there were certainly a million there, it makes it perfectly certain that in the six months preceding, we could have done pretty much the same thing if we had had the tonnage; but we did not have the tonnage.

When we consider this statement of Admiral Sims in connection with the fact stated by him that the tonnage available to the Allies was less immediately after the month of April, 1918, than it was in 1917, the fallacy and groundlessness of his claim, that the destruction of tonnage rendered it impossible to transport out troops to France and thereby prolong the war four months, is obvious.

I come now to the question of the alleged unnecessary destruction of tonnage. Here again Admiral Sims's ascription of the unnecessary loss of 2,500,000 tons to the shortcomings of the American Navy is wholly fallacious. I quote below Admiral Sims's remarkable allegation in this connection:

With the adoption of the convoy system and the antisubmarine measures put into effect by the Allies with our assistance in 1917, the losses were gradually reduced until in October, 1918, they amounted to only 100,000 tons. The period between the beginning of the German unrestricted submarine campaign and the armistice can be divided into three phases so far as losses of merchant tonnage are concerned.

First. The period from February 1, 1917, to the end of July, 1917, when American aid was lacking and when shipping was not being convoyed. Average losses, 640,000 tons per month.

Second. The period of August 1, 1917, to February 1, 1918, when there was a partial employment of the convoy system and moderate assistance from America. Losses, 390,000 tons per month.

Third. The period from February 1, 1918, to the armistice, when full cooperation was given by America, and consequently full use could be made of the convoy system. Losses, 250,000 tons per month.

As will be noted, each of these successive phases of the unrestricted submarine campaign is marked by the degree of naval cooperation received from America. An analysis of the situation, therefore, shows that if the United States Navy had been prepared for war when war began, and if the whole-hearted policy of cooperation with the Allies had been followed from the beginning, the first mentioned above would have come to an end within a month after we entered the war; that is, by May 1, 1917. The second period would probably have ended by August 1, as by that time the full weight of our cooperation would probably have been felt. An estimation of the amount of tonnage that would have been saved shows, therefore, that, if the first period had ended on May 1 and the second period on August 1, 1917, 1,500,000 tons of shipping would have been saved to the Allies in 1917. Similarly, at least another million tons would have been saved in 1918.

It can thus be said that the failure of the Navy Department to enter the war immediately and whole heartedly cost the allied cause as a whole 2,500,000 tons of shipping sunk unnecessarily. While this is, of course, an estimate only, it is based upon actual results obtained when our help became effective, and there is no reason to doubt that it is a conservative estimate.

Admiral Sims, starting from the beginning of the unrestricted submarine campaign on February 1, 1917, alleges that for the first six months the destruction was at the average of 640,000 tons a month; for the second six months, 390,000; and thence to the armistice, 250,000 tons a month. He claims that if the United States Navy had been prepared for war when war began, and if whole-hearted

cooperation with the Allies had been followed from the beginning, the first period would have ended in a little over three weeks after we entered the war, and the second period would have ended by August 1, 1917. I am not going to undertake to analyze his allegations from a technical point of view; that has been thoroughly done by others. I am simply going to point out the inaccuracy in the present allegations themselves and the fact that they are absurd in view of statements made by Admiral Sims in other places. It will be noted that Admiral Sims admits in the above that from February 1, 1918, to the armistice "full cooperation was given by America," and claims that this period of full cooperation should have been reached by August 1, 1917, instead of on February 1, 1918. However, even Admiral Sims appears to admit that there was full and complete cooperation from the American Navy from February 1, 1918, or practically during the whole of 1918; and yet, included in Admiral Sims's two and a half million tons of unnecessary destruction, is a million tons, or 40 per cent of his total charged by him against the United States Navy in 1918, in the face of his own statement that during that period "full cooperation was given by America." Such claims pass my understanding. The most remarkable feature of Admiral Sims's claims with regard to tonnage losses, however, is not the 40 per cent of losses ascribed to the American Navy at the time when Admiral Sims himself admits there was full cooperation.

It will be observed that in his statement quoted above he ascribes the total reduction of losses to the American cooperation, or perhaps I should say failure to reduce losses entirely to the lack of American cooperation. It is interesting to compare this position with Admiral Sims's reports at the time in September, 1917. For instance, on March 23 he said:

On the 11th of September I wrote a letter to the Navy Department, of which I will quote a paragraph here. [Reading:]

"With reference to the antisubmarine campaign, generally speaking, the losses since April have not increased, but, on the contrary, appear to be on the decrease. This, coupled with the fact that the number of submarines operating, has, if anything, increased, is difficult to explain. There is considerable difference of opinion as to the causes for the above. The most reasonable opinion as to decrease in submarine losses and upon which there is the greatest degree of unanimity is as follows:

"(a) The gradual extension of the convoy system, together with increased experience of both the merchant shipping and escorting craft.

"(b) Increase of antisubmarine craft and constant increase of experience thereof, coupled with the more extensive use of the depth charge.

"(c) Effect on enemy submarine morale from the above and particularly from the more extensive use of depth charges. It is wholly impossible to estimate the number of actual submarine losses caused by depth charges, but the fact that depth charges are used liberally whenever a submarine is encountered, unquestionably has a marked effect upon morale.

"(d) Difficulty the enemy must be experiencing in maintaining an adequate supply of efficient torpedoes."

Admiral Sims now ascribes the reduction of destruction from 640,000 tons per month prior to August 1, 1917, to 390,000 tons a month for six months after August 1, 1917, entirely to American action. Yet when reporting to the Navy Department on the 11th of September, 1917, "the most reasonable opinion as to decrease in submarine losses," he does not mention specifically American action, and there was no factor mentioned which does not apply to all of the Allies as well as to the American Navy.

When we consider the effect of American cooperation Admiral Sims admits that the quality of the work done by that portion of the American Navy in European waters was of the highest. Now, of course, the effect of American assistance would depend not only upon its quality but upon its quantity. Admiral Sims is fully on record as regards this matter. I quote from the record of March 23:

Senator TRAMMELL. Did you state in a speech in London on October 10, 1918, as follows?

"Another idea was sometimes in the American mind, that the American Navy had been doing the bulk of the business over here—at least a half. That was not correct. There were about 5,000 antisubmarine craft operating day and night, and the American craft numbered 160, or 3 per cent. The figures were about the same in the Mediterranean. Again, Americans seemed to regard it as a miracle of their Navy that they had got a million and a half troops here in a few months and had protected them on the way."

"We didn't do that," said Admiral Sims. "Great Britain did. She brought over two thirds of them and escorted one-half. We escorted only one-third of the merchant vessels that came here."

Do you remember that?

Admiral Sims. Yes. All those statements are substantially correct, if you take the effective craft. I eliminated from that the little sub. chasers that were sent there, and all escorts of small craft, and ships like that, in ports, etc.

Apparently when Admiral Sims was preparing percentages to show what credit should attach to the American Navy he eliminated from the American forces certain kinds of vessels—and I wish you to bear this in mind, gentlemen—which were unquestionably included by him in figuring the British forces. Fortunately Admiral Sims has testified specifically as to the effectiveness of American forces. He said:

Anybody who takes the ground that the delay of the United States in going into the war was not responsible for certain losses must assume that the naval intervention of the United States was not effective. And I do not assume that. I assume that the United States intervention was effective, and fully effective in proportion to the number of forces we sent over.

The record is perfectly clear, then, that Admiral Sims maintains our forces sent to Europe were "effective in proportion to the number of the forces we sent over," and he has claimed that all the force we sent over was only 3 per cent of the total. This percentage is not that at the time when Admiral Sims maintains the American Navy was doing less than it should, but at the time when he himself admits it was doing all that was possible. He has no complaint to make of what was done after the first six or eight months we were in the war, but this speech in London was on October 10, 1918—18 months after our entry into the war—and on February 10, 1920, before this subcommittee, when discussing the award of medals in the naval service, Admiral Sims (p. 661 of hearings) said:

I remember the first contingent of newspaper reporters that came over to the other side at the invitation of the Government. They were entertained at a luncheon by the minister of information, and I was asked if I would make the customary few remarks. Well, I took pains to ask those gentlemen, before I made those remarks, to give me individually and estimate as to how many of the submarines they supposed were operating to the westward of the British Islands each day. The smallest estimate was 50, and the biggest estimate was 150, and when I told them that there were 8 or 9 to the west of the British Islands, they were astonished.

I also asked them, "What proportion of the antisubmarine forces of the Allies, particularly around the British Islands, do you suppose constitutes the American force?" Well, they thought 15, 20, 30, 40 or 50 per cent, and they were shocked when I told them it was only 3 per cent. And those figures were accurate, because I did the sum myself.

Referring to the antisubmarine craft around the British Islands, and the number that they had there, they were quite accurate. It is quite true we had more later we had 317. That is what I call a small number. You will find the per cent is small; It runs to 5, 6, or 7 per cent.

It appears, then, that when it is a question of giving credit to the American Navy for the antisubmarine force it supplied during the late war, Admiral Sims ascribes to it a pitiful 3 per cent, or by a great concession, 5, 6, or 7 per cent. When, however, it is a question of discrediting the American Navy by alleged failure to reduce the destruction of tonnage, Admiral Sims ascribes to it a 100 per cent responsibility. Further comment is superfluous, and I will now pass to other matters, with the remark that I am completely at a loss to understand how any man of Admiral Sims's ability could seriously put forward such baseless charges. His charges that the American Navy was responsible for prolonging the war four months and two and one-half million tons unnecessary destruction of tonnage are fully refuted by his own statements, or fully disproved by facts of common knowledge.

ADMIRALS ANSWER SIMS'S CHARGE THAT THE NAVY PROLONGED THE WAR.

The distinguished officers who had charge of our most important activities during the war have indignantly repudiated Admiral Sims's charge that the Navy Department, by alleged unpreparedness and delays, prolonged the war four months, causing the loss of 2,500,000 tons of shipping, 500,000 lives, and the needless expenditure of \$15,000,000,000. One after another declared that nothing the Navy Department did or did not do delayed the winning of the war one week or one day.

"NOT ONE PARTICLE OF TRUTH IN THAT STATEMENT," ADMIRAL RODMAN'S OPINION.

Admiral Rodman, who commanded the United States battleships which for a year operated with the British Grand Fleet, told you, "I do not believe there is a particle of truth in that statement." And Admiral Rodman was right.

In reply to Senator Trammell's question as to whether this charge was correct or not, Admiral Rodman said:

It is no reflection on Admiral Sims, but there is an old saw to the effect that there are three kinds of lies—"lies, damn lies, and statistics." I think that is hypothetical entirely. No, sir; I do not think that any fair-minded man could ever say that the American Navy was ever responsible for any loss of tonnage or loss of lives. Now, if I understand the conditions to which that question there pertains, it possibly refers to the submarine attacks on allied shipping.

I have no conception of those figures whatever, nor could I possibly, before any jury or before a committee and under sworn testimony, give positive evidence as to facts and as to figures; but I do not believe there is a particle of truth in that statement; not that Admiral Sims was not perfectly conscientious and may not have thought so. It may have been his interpretation. I will tell you why. Let us assume that there were a certain number of vessels of the Allies engaged in trying to get the submarines. Our percentage of that number, if we had sent every ship that was available for submarine combat, to the infested area, would have been only a small percentage. I do not know what, but it is small. Ten per cent of that amount of shipping, and that amount of lives that were lost by the submarine menace—give us 10 per cent of it, if you like, maybe, but let us make it out proportional to the

number of ships that you have sent there, and that statement ought to be knocked into a cocked hat. That is my opinion.

And that is the opinion of the distinguished admiral, the only admiral of the Navy who was in command of ships across the ocean, on the seas, during the war, the commander in chief of the Pacific Fleet, one of the greatest officers in the American Navy, and all-American.

"MATERIALLY AIDED IN SHORTENING THE WAR" AND "SAVED UNTOLD LIFE AND PROPERTY," ADMIRAL WILSON SAID.

Admiral Wilson, who was in command of United States naval forces in France, and was familiar with the work of other navies, as well as our own, in troop and supply transportation and antisubmarine operations, said in his "conclusions":

That from the moment war was declared the entire Navy—the department as well as the fleet—entered into the prosecution of the war with the greatest energy, and its accomplishments deserve the commendation of the Nation.

That our naval forces from the start cooperated in a most successful manner with the naval forces of our associates in many portions of the seas, and by their splendid and efficient work materially aided in shortening the war and in this manner saving untold life and property.

Now, there is Admiral Wilson, commander in chief of the Atlantic Fleet, declared by Admiral Mayo and every other officer under whom he has ever served to be a most competent officer; Admiral Wilson, who was in command at Brest during the war, through whose hands passed over 2,000,000 soldiers on the way to the front. Admiral Wilson says that our naval forces materially aided in shortening the war, and in this manner saving untold life and property.

In answer to Senator Pittman's question regarding Admiral Sims's charge, "I ask you, in your opinion, based upon your experience and knowledge of this war, is that charge true?" Admiral Wilson answered:

I do not believe this to be true. On the contrary, I believe that our naval forces from the start—

Bear in mind, Mr. Chairman, from the start; and if anybody knew, Admiral Wilson knew, because he was the first officer placed in charge of the patrol force—

I do not believe this to be true. On the contrary, I believe our naval forces from the start cooperated in a most successful manner with the naval forces of our associates in many portions of the seas; and by their splendid and efficient work, materially aided in shortening the war and in this manner, saving untold life and property, as stated in my conclusions.

To further show the faulty reasoning of Rear Admiral Sims, I ask attention to that part of the testimony before the committee contained in a memorandum prepared in the London office on August 3, 1918, for the information of the House Naval Committee. At this time we had about 300 vessels of all kinds in European waters. The memorandum states in part that "of all total craft operating against enemy submarines in British and eastern Atlantic waters, the American patrol forces constitute less than 5 per cent of the total number."

If, after 16 months of effort, we had less than 5 per cent of the total forces operating against the enemy (as the Naval Committee was informed), it is not probable that during the first six months we could have aided with more than 2 per cent of the total allied forces and I fail to see how such a small percentage of the total number of vessels operating against the enemy's submarines could have had so serious influence upon the duration of the war or upon the loss of life and shipping.

"SIMS'S STATEMENT INDEFENSIBLE HISTORICALLY," ADMIRAL NIBLACK CONCLUDED.

Admiral Niblack, who was in command of the United States naval forces based on Gibraltar, through which passed one-fourth of all the allied shipping in the world, said in his direct statement:

Admiral Sims states that our failure to send all of our antisubmarine vessels to the war zone immediately on the outbreak of war resulted in prolonging the war four months. A study of the vast problem of protecting the cargo ships of the Allies, will show that the number of protecting vessels which we might have sent and did not send to Europe at once was so small that the results could not have been materially different. In a statement made in London in 1918, Admiral Sims stated that we had only 3 per cent of the antisubmarine forces in Europe that the Allies had.

It is difficult to figure that with a maximum of only 3 per cent we could have shortened the war so greatly as four months; moreover, the small increase in the number of escorting vessels which we sent over between July and October could not have resulted materially in increasing the amount of protection furnished the cargo ship convoys, since it is here pointed out that the protection in the way of escort to the cargo ships was of the very scantiest character. * * *

I think we are apt to exaggerate the effect of the convoy system in lessening the number of sinkings, because I think we should take into consideration, as Admiral Mayo also points out, the employment of new and offensive measures through the use of depth charges, mystery ships, air ships, kite balloons, the laying of mine barges, the firing of torpedoes from allied submarines, combined with the use of organized patrols fitted with listening devices and hunting the submarine systematically. * * *

The sinking of submarines was, however, not attributable to any one method employed against them, but was the result in pretty equal proportions of the various means employed against them. * * *

One very important phase of the discussion of the convoy system which has been entirely overlooked is that during the entire war only one escorted convoy crossed from the United States to Gibraltar, and this was the one escorted by the U. S. S. *New Orleans*. This convoy was dispersed by heavy weather and was not regarded as entirely successful, because the ships came into Gibraltar subsequently singly. All the rest of the million tons of shipping which crossed from the United States to Gibraltar went across as single ships, going "on their own," as it were. These ships depended on their armed guard gun crews, and were independent of the convoy system. They actually encountered submarines, but they relied on their guns for protection.

Quoting Admiral Sims's charge that the Navy prolonged the war, Admiral Niblack said: "This, in my opinion, is the contention for which Admiral Sims's whole testimony stands," and he concluded that "the elements which entered into the collapse of the German offensive were so numerous, so varied, and so incapable of sweeping generalization that it is impossible, historically, to accept Admiral Sims's offhand statement."

In his cross-examination, in which he was asked numerous questions in regard to this charge, Admiral Niblack said, in reply to your chairman's inquiries:

The question is one of statistics. I say, and others have said, that this statement of Admiral Sims's is indefensible historically. I would be very glad to help my friend Sims out on it, but I can not.

SIMS'S CHARGE ANALYZED AND EMPHATICALLY DENIED BY ADMIRAL STRAUSS.

Admiral Strauss, who commanded the United States mine forces which were engaged in laying the North Sea barrage, gave you a careful analysis of the tonnage situation, disproving Sims's charge, and declared his conviction that the delays alleged did not in any degree prolong the war.

Answering the question as to whether Sims's statements were correct, Admiral Strauss said:

I have studied Admiral Sims's statement with respect to tonnage losses in connection with this question, and compared it with the information bulletin he sent out from London in September, 1918. The losses given in the bulletin from May to July, 1917, inclusive, total 1,825,670 tons. In the remaining five months of 1917 the losses total 2,004,725 tons. Grand total from the time we might have become active on May 1, 1917, until the end of that year, 3,830,393. Of this loss Admiral Sims states in his hearings a million and one-half tons would have been saved by our earlier cooperation. That is 39.2 per cent of all that was sunk.

Now, take the next year. Admiral Sims cites the losses in October as being 100,000 tons. As a matter of fact, it was 112,427, but he should have excluded October altogether from monthly comparisons, since according to agreement the Germans called all submarine warfare against merchant tonnage on the 11th of that month.

However, the total 1918 loss, according to the bulletin, amounts to 2,625,848, and Admiral Sims gives it as his opinion that we could have saved 1,000,000 of that if we had cooperated sooner. That is 38 per cent of the total for 1918. Now note that after fully entering into the business of protecting shipping, instead of a rise in percentage we are credited with a drop. With all due pride in our very efficient work in the war, I would give a lower estimate as our share, since the British, operating in their home waters, actually had 3,000 vessels devoted to this duty as against our 232. Furthermore, Admiral Sims himself gives as our share less than 5 per cent of the total number of all patrol craft operating against enemy submarines in British and Eastern Atlantic waters. (See Admiral Sims's memorandum to House Naval Committee, August, 1918.)

I feel that the data I have presented should be substituted for the complex calculation submitted by Admiral Sims, as showing that no action of ours, between our declaration of war and the cessation of hostilities, could have saved anything like two and one-half million tons. As the war progressed, many things contributed to the suppression of the submarine, the wholesale use of depth bombs in the spring of 1918, improved listening devices, the northern barrage, experience in fighting them, etc. All of these as well as our share of the patrol and convoy were factors.

On December 2, 1917, Gen. Pershing cabled the War Department as follows: " * * * The minimum number of troops we should plan to have in France by the end of June (1918) is four Army corps and 24 divisions, in addition to troops for service in the rear."

And further: "A study of American tonnage shows sufficient American tonnage to bring over this number of troops, but to do so there must be a reduction in tonnage allotted to other than Army needs." He had previously defined shipping for Army needs as including that for transport of steel, coal, and food.

The above excerpts from Admiral Sims's quotations from Gen. Pershing's report are significant. It states, in effect, that we must further disturb the economic condition of the country by diverting tonnage from trade to the pressing military needs, but leaves us to infer that if the troops and equipment are there, they can be transported. I have seen no statement anywhere that leads me to doubt that when the troops were ready to go transportation was there to take them. Twenty-four divisions of 20,000 each equals 480,000 men. By the end of June the date set, we had over a million men in France.

And Pershing expected only 480,000.

This number must have exceeded the highest hopes of the allied military leaders.

Stating his conclusion as to whether Admiral Sim's charge is true, Admiral Strauss said:

In my opinion, as a result of the above figures, the answer is no.

"DID NOT PROLONG THE WAR FOR A SINGLE DAY," ADMIRAL FLETCHER CONCLUDED.

Admiral Frank F. Fletcher, a member of the General Board of the Navy and of the War Industries Board and former commander in chief, United States Atlantic Fleet, told you:

The war mission of this country was made perfectly clear. Our sole main objective was to put a trained and equipped Army on the fighting line in France strong enough

to overcome the enemy in the final test of battle. Every other activity of the war must be subordinate and auxiliary to the accomplishment of this end. We must not for one minute lose sight of this fact. Every activity of the enemy which did not seriously menace the carrying out of this plan was of comparatively insignificant importance. Even the submarine menace, with all the fears and terrors its unknown possibilities inspired, could have no influence on the final outcome of the war unless it could succeed in starving England out of the war and in blocking our Army and its supplies across the Atlantic Ocean. The submarine menace accomplished neither of these objects.

I have previously shown how the creation of an American Army in France depended upon the output of our factories at home, and mentioned the length of time it required to get our factories up to quantity production. As the war progressed supplies came on in gradually increasing quantity and, through an economical use of shipping, were being continually accumulated on the other side. The size of the American Army that we could place in France at any given date after our entry in the war depended upon the quantity of war material—shells, powder, high explosives, rifles, artillery, and all the varied equipment that could be produced. The size of the Army depended upon these things and not upon the number of men that could have been transported across the sea by any given date. We could have placed a million men in France four months or even five months sooner than we did, but we would not have had an army there.

However, when sufficient war material had been created and we were ready for transportation, all necessary world shipping engaged in less essential work was summoned to our shores from many quarters, and our men were sent across the Atlantic as fast as they could march aboard ship on this side and disembark on the other side, and the first army of 1,000,000 men was assembled in France at the earliest possible date.

Neither the loss of shipping nor the imaginary loss of shipping that might have been saved delayed, through lack of transportation, the execution of the plan of creating an army in France for one hour, nor did it prolong the war for a single day.

That is Admiral Fletcher, commander in chief of the Atlantic Fleet at one time, a member of the General Board, and a member of the War Industries Board, one of the wisest, ablest statesmen the American Navy ever possessed, in command of our forces at Vera Cruz, and who in every place he has ever filled has shown the highest ability. I wish to repeat that. [Reading:]

Neither the loss of shipping nor the imaginary loss of shipping that might have been saved delayed, through lack of transportation, the execution of the plan of creating an army in France for one hour, nor did it prolong the war for a single day.

In the American Navy, Mr. Chairman, the statement of Admiral Fletcher, without any evidence from any other quarter against Admiral Sims's absurd and preposterous statement, would be convincing. Admiral Fletcher continues:

Mr. Chairman, I think your committee will now understand how it is that from my point of view I can reach but one conclusion with reference to the accusation "that the Navy Department is responsible for the loss of 2,500,000 tons of shipping, the prolongation of the war for four months, \$15,000,000,000 of debts, and the loss of 500,000 lives." The accusation is based upon assumptions and has no foundation on facts. The whole conclusion reached in the accusation is built upon the flimsy foundation of a hypothetical condition and is wholly without value.

"UTTERLY UNFOUNDED," ADMIRAL BADGER SAID.

Admiral Badger—and by way of parenthesis I would like to say, while I would not make any comparison of the men of the Navy, Admiral Badger is the wisest statesman that the American Navy has had since Admiral Dewey's death—chairman of the General Board and former commander in chief of the United States Atlantic Fleet, in his testimony said:

As to the statement that the failure of the United States to immediately send its full force of destroyers and antisubmarine craft to the war zone prolonged the war

four months and occasioned the loss to the Allies of 2,500,000 tons of shipping, 500,000 lives, and \$15,000,000,000, this is a very grave charge but one that I believe to be utterly unfounded. It is, in my opinion, based upon an entire misapprehension of the influence of the enemy submarines upon the duration of the war.

Looking broadly at the progress and conduct of the Great War, the blockade stands out as one of the most salient and decisive features.

From almost the day war was declared by Great Britain an effective sea blockade was instituted and maintained against the Central Powers to the very end. At no time did the development of submarine warfare loosen the grip of this blockade, which worked silently, slowly, and unceasingly to exhaust the material war resources of the enemy.

Enemy submarines, it is true, destroyed an enormous amount of ocean tonnage, supplies of all kinds, a considerable number of lives, and placed the allied cause in great peril, but with all their efforts they failed to break that strangling blockade or do sufficient damage to extort a favorable peace proposition and so, in the end, failed of their purpose.

The submarine operations added nothing to the Central Powers' material strength. The submarines did not open their ports to food or raw materials or other necessities for the prosecution of successful warfare. Actually the Central Powers were no better off, internally, with submarine operations in full blast than without them. Unless the submarines could so exhaust the allied resources that men and supplies could not be furnished in sufficient volume to the fighting fronts they had no decisive effect upon the progress or duration of the war.

Laboring under the handicap of our strict neutrality, creation of our new armies was not commenced until after war was declared though doubtless plans had been previously made for hastening a general mobilization when the time should come. Under the best of conditions, it took time to recruit, equip, organize, and give some preliminary training to the men destined for foreign service. It was not until a good many months after the declaration of war that we began to send our troops abroad in great numbers, though Admiral Gleaves escorted the first convoy of regular troops across the ocean in the latter part of June, 1917. By good management—it was not luck—we got a little more than 2,000,000 abroad in the course of a year and a half without loss and despite the submarines.

It is important to realize that the number of men we sent abroad in the time was phenomenal and was not limited by lack of overseas transportation. In the emergency transport was found, and utilized, and, so far as the submarines are concerned, they can not be said to have even checked the ocean transit of our troops. It was the arrival on the Continent of fresh troops from America in increasing and seemingly unlimited numbers that finally broke the morale of the enemy, already near the breaking point from four years of strenuous fighting and the material exhaustion due to the blockade.

Admiral Badger continues:

His submarine campaign failed to relieve the blockade, failed either to check the flow of troops from the United States so soon as made ready to cross the ocean or to stop delivery of the necessary supplies for the use of the armies at the front. It did not, in fact, delay the progress of the war, which, as was early predicted, had to be fought out on the western front—though it came measurably near doing so.

The enemy fought until he was exhausted, materially as well as morally. Nothing that the submarines did contributed toward relieving the exhaustion of materials. They weakened the resources of the Allies but fortunately not to the point where they could not support their civil populations and provide liberally for their armies in all their needs. The doors were closed to the enemy and nothing could enter. The submarine failed to open those doors even a little way, and collapse ensued. I am of the opinion—

Says Admiral Badger, the chairman of the General Board—

that the absence from the submarine danger zone, for a few weeks or even months, of a comparatively small number of United States destroyers or other antisubmarine craft in the early days of the war had no effect whatever upon its duration.

WOULD NOT HAVE SHORTENED THE WAR IF ALL OUR FORCES HAD SAILED FOR EUROPE THE DAY WAR WAS DECLARED, CAPT. PRATT SHOWED.

Capt. Pratt, who was in command of the destroyer flotilla and who was Assistant Chief of Naval Operations, and in Admiral Benson's

absence was Acting Chief of Operations, presented to you a comparison of forces which clearly shows that we could not have been responsible, under any circumstances, for more than a small proportion of the losses Sims charges; which losses could not have been prevented if every vessel we had should have sailed for Europe the day war was declared—

Suppose that on April 6, 1917, our entire naval forces had been ready and mobilized and had sailed on that date for Europe, would we then have been prepared to wage war under the actual conditions on that date?—

is a question Capt. Pratt asked and answered thus:

This requires still another estimate of our forces, that have sufficient capacity to cross the Atlantic.

ESTIMATE OF UNITED STATES FORCES UNDER CONDITION (6).

Fourteen dreadnaughts, 9 armored cruisers, 19 battleships, 4 cruisers first class, 3 cruisers second class, 15 cruisers third class, 51 destroyers (750 tons and greater), 16 coast torpedo vessels (420 tons), 7 tenders, 3 converted yachts, about 12 tugs and special service ships (repair ships, etc.), 22 fuel ships, 5 supply ships, 4 transports, 10 gun boats, perhaps 15 submarines (very doubtful), and about 4 coast guard ships.

This would represent 100 per cent of efficiency if everything worked like clockwork. Of all these ships the only ones which can be called real submarine fighters are the 51 destroyers of 750 tons. The 16 coast torpedo vessels are of very doubtful value, old and not good sea-keeping craft, of small radius of action; the 3 converted yachts the 10 gunboats, and the 4 coast guard ships are not fighters, but might be useful for escort and patrol. The other types, except the cruisers for convoy, are not wanted on the other side.

Therefore, absolutely disregarding our own needs, our own patrol, and our own fleet needs, are we still prepared to wage efficient war against the submarines, if every one of the craft enumerated, valuable for antisubmarine work April 6, 1917, sail at once? The total, at utmost, is 99, counting submarines. Let us make a comparison of this effort with the antisubmarine effort the Allies were making, as nearly as I can estimate:

Total British and French antisubmarine forces around British Isles and in Atlantic.....	967
French, British, and Italian forces in Mediterranean.....	736
Total.....	1,703

In other words, our total effort in that line, if we could have executed it instantly, could not have exceeded a ratio of 1 to 17, provided we neglected everything else, and everything worked like clockwork, or between the 5 and 6 per cent stated by Admiral Sims (my conclusions being worked out independently). Therefore, if we could have instantly applied our forces, with its good, indifferent, and its bad antisubmarine factors in it, to the aid of the Allies during the month of April, and taken to ourselves our proportionate share of the April losses in merchant tonnage, what would have been our share? It ought to be in proportion to the relative force we might have applied—that is, we might have had a maximum one-seventeenth or 5 per cent interest in it. The April sinkings were by long odds the greatest, amounting to 846,863 tons for that month as against 558,712 tons average, if we take the six very worst months, including April and on. So, on the 5 per cent proportion of our interest of the worst month, April, we had to our discredit a maximum of 42,343 tons of shipping, or a total of 254,058 tons for the next six months, provided we had not done a thing, and the submarine had been able to sink his 846,000 tons month by month, which, of course, we know he did not do. On the average six months' loss, 558,212 tons' basis, our monthly discredit share is 27,910, and our total six months' discredit share 167,460 tons.

He therefore concludes that—

The statement that we are responsible for 2,500,000 tons shipping loss is not so, looking at it in the light of cold figures.

Cross-examined as to whether, if all our antisubmarine craft had been sent over immediately it would have shortened the war, Capt.

Pratt maintained the opinion that it would not, as is shown by this extract from the record:

The CHAIRMAN. That is, you do not believe that it would have shortened the war by four months?

Capt. PRATT. Oh, no, sir; I feel perfectly satisfied it would not.

The CHAIRMAN. Do you think it would have shortened it three months?

Capt. PRATT. No, sir.

The CHAIRMAN. Or two months?

Capt. PRATT. No, sir; I do not.

The CHAIRMAN. Or a week?

Capt. PRATT. No, sir.

The CHAIRMAN. Or a day?

Capt. PRATT. No, sir.

CHARGE "MONSTROUS," AND AN INSULT TO EVERY MAN IN THE NAVY, ADMIRAL M'KEAN DECLARED.

Admiral McKean, an able officer of the Navy, who was aid for Material in the Office of Naval Operations, and at times was Acting Chief of Operations, declared that Sims's charge was "monstrous" and an insult to every officer and man in the Navy. And when Admiral McKean made that statement he was using the language of moderation.

Reviewing the various antisubmarine measures adopted, and the unavoidable delays in securing materials, men, approvals, and appropriations, Admiral McKean said:

I do not believe that the sum total of all these delays prior to our entering in the war, or after our entering into the war, gives the slightest foundation for anyone to justly make the charge against the Navy Department that it was responsible for delaying the end of the war four months.

Nor do I believe that anyone, short of the good God Himself, has sufficient knowledge of the various elements and factors entering into the war and the causes of its conclusion to justify him for one moment in charging that the Navy, or any of its officers, were responsible for the loss of any part of the 2,500,000 tons of allied shipping claimed to have been unnecessarily lost; nor for any part of the \$15,000,000,000 of the Allies' money claimed to have been unnecessarily spent; nor, least of all, do I believe that there is any human being with sufficient information and sufficient knowledge to justify him in charging the unnecessary loss of life of 1 of the 500,000 allied soldiers charged to have been due to the errors of the Navy.

This monstrous charge—

Admiral McKean says "this monstrous charge," and "monstrous" is the mildest word that he could use, to make it adequate—

has been or will be disproved in every item. Had it been made by any foreign official, allied or enemy, it would have aroused the indignation of the whole American people!

Had it been invented by the inflamed, exaggerated, diseased ego of a patient in St. Elizabeths, the Government Hospital for the Insane, no one would have been surprised. That it was made under oath by a rear admiral of the United States Navy, on the active list, president of our Naval War College, in a hearing before a committee of the United States Senate, is, in my opinion, an insult to every officer and man now in the Navy, or who served in the Navy during the World War.

CHARGE AN "OUTRAGE" UPON THE AMERICAN PEOPLE AND THE ENTIRE NAVY, ADMIRAL BENSON DECLARED.

Admiral Benson, former Chief of Naval Operations, declared that this charge made by Admiral Sims is "an outrage to the American people"; and "an outrage to the honorable record of the United States Navy." He expressed the opinion that, "if it is allowed to

stand, it will be to the everlasting disgrace of the Navy" and will weaken it now and in the future.

The following is taken from the record of Admiral Benson's testimony:

Senator PITTMAN. All these matters, Admiral, so far have largely been dealing with minor plans embraced in Admiral Sims's letters or reports, and his charges before this committee. The vital charge, in my opinion, the charge that affects the standing of the Navy before the world, and you might say the honor of our Government, and which alone in my opinion justifies the appointment of this committee, is the ultimate, serious charge made by Admiral Sims, that by reason of delay in sending forth our antisubmarine craft, and by reason of unpreparedness, we were responsible for an extension of the war for a period of four months, and the consequent loss of 500,000 men. Now, I want to know positively and directly whether you agree with that charge or disagree with it?

Admiral BENSON. I disagree most decidedly with it, sir, and I would like to be allowed to give my views in regard to it.

Senator PITTMAN. I would be very pleased to hear them and I have no doubt that the committee would.

Admiral BENSON. As I have stated before, I firmly believe what hastened the close of the war, as far as America was concerned or the United States, in the main, was getting American troops on the western front. The one thing that hastened it particularly was the formation of the American Army under Gen. Pershing. I do not believe that any possible delay, if such there was, had the slightest effect on lengthening the war, except in this way, that had we not gotten in there, had we not done what we did do, the Allies might have been forced into a peace and ended the war before we got into it, they being the losers and the Germans being the winners.

Under no circumstances could the war have been shortened by what we did or did not. That is the military and naval view. I am satisfied, of those who are in a position to judge, and the mission of the United States Navy in this war, next to protecting our coasts and vessels, was to get our troops into France and keep them and the Allies as far as possible supplied with munitions and provisions.

We carried the troops over—those that we did carry—and we assisted the Allies in what they carried, and we brought our troops back, and to the best of my recollection the Navy never lost an American soldier while it had it in charge.

In 1918, we were getting them over there at the rate of over 300,000 a month, the most wonderful performance that was ever seen or ever dreamed of, and it was due to this fact that the end of the war was hastened; and there has never been any complaint that I know of, or any intimation of any failure on the part of the Navy either by our Army or anybody in this country, or any of the Allies; no intimation of our failure to act up to the limit in the most enthusiastic and efficient manner, with the means that we had to perform, except the complaint which Admiral Sims has made.

I feel that the complacency or the calmness with which the American people have accepted that statement is a tribute to their sense of fair play, but I must express in the strongest possible language that I think it is an outrage to the American people. I think it is an outrage to the honorable record of the United States Navy; I think if it is allowed to stand it will be the everlasting disgrace of the Navy and I think that our first aim of national defense will be weakening now and in the future. I think it is particularly hard and outrageous on the nearly 500,000 young men who volunteered in the Navy, and who did such splendid work, and who went back to their homes feeling proud of the service in which they served, and the people that gave them up to the service of the country were proud of them. And I feel very strongly that if there be any doubt or any question in anybody's mind as to this situation, the experts of the Army and every person in the country who is able to form a correct judgment should be called before this committee to give their opinion on it. I feel that it is too serious a charge to be allowed to stand, and I feel very strongly that, as I said in the beginning, it is an outrage on the American people, and particularly on the American Navy.

I have, therefore, given you, Mr. Chairman, the opinions of these 10 men, of the 9 admirals, and Capt. Pratt, a ranking captain—the opinions of the 10 men who had the largest responsibility of the carrying on of the war, for the Navy; and these 10 men all agree that Admiral Sims's statement is preposterous, absurd, without foundation, an outrage upon the American people and upon the

American Navy; and when the American people read the opinions of these 10 officers and then read Admiral Sims's opinion, no doubt they will agree with the 10 men rather than with the preposterous and outrageous slander upon an honored service.

Yesterday, or day before, I gave to your committee a statement showing that Admiral Sims did not recommend a single new, a single bold, a single audacious policy that was established or carried out by the Navy during the entire war. Now, in order to be perfectly fair to him, and that the record shall show, I will give you what Sims did recommend.

WHAT SIMS RECOMMENDED.

Admiral Sims read to you, in full, his first two reports submitted to the department, one a cable sent four days after his arrival abroad, (April 14, 1917) and the other a letter submitted five days later (April 19, 1917.) He has told you:

Although these two documents will touch on various subjects, it is necessary to read them in full simply to establish the fact that all of the communications which followed during the next six or eight months were mere elaborations and reiterations thereof; that these two reports were very comprehensive, and that, as a matter of fact, there was no time up to the signing of the armistice when any cause arose for changing any of these original recommendations as therein made.

As the admiral himself states that these documents embody all the really vital and important recommendations he made, it is worth our while to see what those recommendations were. Here they are, stated in Sims's own words (dispatch of April 14, 1917):

Maximum number of destroyers to be sent accompanied by small antisubmarine craft, former to patrol designated high-sea area westward of Ireland based on Queens-town with an advance base at Bantry Bay, latter to be an inshore patrol force. Destroyers, small craft, should be of light draft with as high speed as possible but low speed also useful. Also repair ships and staff for base. Oil and docks available but advise sending continuous supply of fuel. German main fleet must be contained demanding maximum conservation of the British main fleet. South of Scotland no base is so far available for this force.

At present our battleships can serve no useful purpose in this area except that two divisions of dreadnaughts might be based on Brest for moral effect against anticipated raids by heavy enemy ships in the channel out of reach of British main fleet.

The chief other and urgent practical cooperation is merchant tonnage and a continuous augmentation of antisubmarine craft to reinforce our advanced forces. There is a serious shortage of the latter craft. For towing the present large amount of sailing tonnage dangerous areas seagoing tugs would be of great use.

The cooperation outlined above should be expedited with the utmost dispatch in order to break enemy submarine morale and accelerate the accomplishment of the chief American objective.

Note carefully his recommendations:

That maximum number of destroyers be sent. We had decided to send destroyers to Europe and orders to that effect had been issued before we ever received Sims's dispatch. We also sent the maximum number possible, and sent them with what the best naval officers considered notable promptness. Though they had to go on a 3,000-mile voyage, our destroyers were rapidly fitted out. The first division sailed within 10 days after Sims's dispatch was received. Within two weeks, that is by the end of April, as Admiral Mayo testifies, all destroyers with the Atlantic Fleet and the tenders *Melville* and *Dixie* had been ordered to fit out for distant service.

We had only 50 modern destroyers and wanted definite information as to how many the British regarded as necessary to meet the immediate need. Sims stated in his despatch of April 28:

Yesterday the war council and Admiralty decided that cooperation of twenty-odd American destroyers with base at Queenstown would no doubt put down the present submarine activity which is dangerous and keep it down. The crisis will be passed if the enemy can be forced to disperse his forces from this critical area.

One division of 6 destroyers was already on its way to Queenstown and arrived May 4. A second division (6) sailed three days later; and within a month of the time the war council and Admiralty stated that "twenty-odd" would do the work in the critical area 28 destroyers were either in Queenstown or on the way there. Two repair ships and staff for base was also sent as requested.

That our battleships could "serve no useful purpose" in that area, except that two divisions of dreadnaughts "might be based on Brest for moral effect against anticipated raids." As it was our policy to maintain our fleet intact, and not to detach battleships except for vital reasons, this casual suggestion of sending two divisions of dreadnaughts to Brest or the channel for "moral effect" did not appeal to the department. We well realized, as Sims so repeatedly stated and emphasized, that the vital mission of destroyers was to operate against submarines. Even Sims could hardly have wished us to send our dreadnaughts into the war zone without protection. He said the British had not nearly enough destroyers for their own uses. To have furnished screening vessels for those dreadnaughts—I wish you to bear that in mind—we would have been compelled to have withdrawn our destroyers from Queenstown, where Sims tells you they were more vitally needed than anywhere else in the world. There is no need of stating further the utter folly of this suggestion of Sims regarding our battleships.

That merchant tonnage and antisubmarine craft be augmented as rapidly as possible. We had already in March ordered hundreds of submarine chasers, chartered and leased yachts and other available small craft, and work was pressed with all possible speed to send them overseas. We had made contracts for many destroyers, and soon had contracted for all American yards could build. The Shipping Board was then laying the foundations for the greatest merchant tonnage ever built in the world in a similar period.

That seagoing tugs be sent. The number of such tugs in America was not then, nor was it ever during the war, sufficient for all the vast traffic essential for war purposes of our ports; and the towing requirements of transports, cargo and passenger ships, and the barges and other craft carrying fuel in coastwise trade. It was these tugs which in the terrible winter of 1917-18 relieved the coal shortage of New England and kept its shipyards and munition plants running. Tugs were among the last things we sent, because we had so few of the ocean-going type, and they were of the craft America could least spare if war needs were to be met. They were the craft that towed coal to New England and kept running the factories, shipyards, and munition plants of the region Senator Hale and Senator Keyes represent. If we had sent them to England, they could not have performed for New England that vital service which enabled the factories of that section to turn out tons and tons of war material.

Admiral Sims told us in that first dispatch of his. This is a very important telegram [reading]:

It is very likely the enemy will make submarine mine-laying raids on our coast or in the Caribbean, to divert attention and keep our forces from the critical area in the eastern Atlantic through effect upon public opinion. The difficulty of maintaining submarine bases and the focusing of shipping on this side will restrict such operations to minor importance, although they should be effectively opposed principally by keeping the channel swept on soundings. Enemy submarine mines have been anchored as deep as 90 fathoms, but majority at not over 50 fathoms. Mines do not rise from the bottom to set depth until from 24 to 48 hours after they have been laid.

So far all experience shows that submarines never lay mines out of sight of landmarks or lights on account of the danger to themselves if location is not known. Maximum augmentation merchant tonnage and antisubmarine craft where most effective constitute the paramount immediate necessity.

Sims, as will be seen, informed us that the enemy would probably make submarine mine-laying raids on our coast. This was a warning that we could not neglect. The Navy is always the Nation's first line of defense, and the protection, as best we might, of our coasts and shipping from submarine attack was a duty that could not be neglected. We were quick to send and did send to Europe all the destroyers we could spare, and more than eminent naval authorities thought we were justified in sending. But we never for a moment thought of adopting Sims's astounding recommendation that we send all our antisubmarine craft to Europe and "strip our coasts entirely of sea-going protection." Mr. Chairman, he actually advised us to strip our coasts entirely of sea-going protection; which we declined to do.

There was not a naval officer of standing in America who approved such a plan. The results when the enemy submarines did appear off our coasts later proved the wisdom of the department's policy; and the disastrous results that would have followed if we had adopted Sims's repeated urgings to "strip our coasts of all seagoing protection." As a matter of fact, Germany knew much of the movement of allied craft, and if the advice of Sims had been taken that we "strip our coasts entirely of sea-going protection" the German submarines would, in all probability, have come across the Atlantic in 1917 instead of waiting until 1918. It was because the Germans knew we were ready for them that they delayed coming to our coasts until we had sent nearly all our best destroyers overseas. The Navy Department by its American action showed more wisdom than Sims displayed in his London advice. We furnished the maximum help in the submarine zone and also protected the American coasts, two duties which were imposed upon the Navy Department. In this advice, as in other, as Admiral Niblack said in testimony, Sims saw only one phase of the Navy's mission. The Navy Department envisioned it all.

ANALYSIS OF ADMIRAL SIMS'S LETTER.

Admiral Sims's letter of April 19, 1917, is in the main, an elaboration of his dispatch of April 14, containing only one additional suggestion, that of possible use of our submarines. But it does give a very clear idea of the policies being pursued by the British Navy at

the time, as is shown by the following extracts from the admiral's report. He says:

14. Considerable criticism has been, and still is, concentrated upon the Admiralty for not taking more effective steps and for failing to produce more substantial and visible results. One of the principal demands is for convoys of merchant shipping, and more definite and real protection within the war zone.

17. After trying various methods of controlling shipping, the Admiralty now believes the best policy to be one of dispersion. They use about six relatively large avenues or areas of approach to the United Kingdom and Channel, changing their limits or area periodically if necessity demands.

18. The great difficulty in any method of shipping control is communication with the shipping itself and full cooperation by the merchant personnel. The moment a ship is captured the code either becomes dangerous or useless. The merchant code is being continually changed and at all times it can not be counted upon for more than a fortnight. The immense difficulty of changing the code and keeping shipping over all the world in touch with changes is apparent.

20. The Admiralty has had frequent conferences with merchant masters and sought their advice. Their best unanimous demand is "Give us a gun and let us look out for ourselves." They are also insistent that it is impracticable for merchant vessels to proceed in formation, at least in any considerable numbers, due principally to difficulty in controlling their speed or to the inexperience of their subordinate officers. With this view I do not personally agree but believe that with a little experience merchant vessels could safely and sufficiently well steam in open formations.

21. The best protection against the submarine menace for all classes of ships, merchant as well as naval, is speed and zigzagging, not more than 15 minutes on a course. Upon this point no one disagrees, but on the contrary there is absolutely unanimity of opinion.

22. In the absence of adequate patrol craft, particularly destroyers, and until the enemy submarine morale is broken, there is but one method of meeting the submarine issue upon which there is also complete unanimity—increased number of merchant bottoms, preferably small. "More ships. More ships. More ships." is heard on every hand.

23. It is also significant that until very recently the Admiralty have been unable completely to convince some members of the cabinet that the submarine issue is the deciding factor in the war. The civilian kind, here as at home, is loath to believe in unseen dangers, particularly until the pinch is felt in real physical ways.

Admiral Sims also states, paragraph 24:

The prime minister only two days ago expressed to me the opinion that it ought to be possible to find physical means of absolutely sealing up all escape for submarines from their own ports. The fact that all such methods (nets, mines, obstructions, etc.) inherently involve the added necessity of continuous protection and maintenance by our own naval forces is seldom understood and appreciated. I finally convinced the prime minister of the fallacy of such propositions by describing the situation into which we would be led, namely, that in order to maintain our obstructions we would have to match the forces the enemy brought against them until finally the majority if not all of our forces would be forced into dangerous areas where they would be subject to continual torpedo and other attack, in fact in a position most favorable to the enemy.

What a historical picture, this, of an American admiral, who had been in London two weeks, patiently explaining to Lloyd-George, who had borne the burdens of the war three and a half years, that his ideas were all wrong. If he convinced the British prime minister that he was wrong, he failed utterly when later he undertook in a long cablegram to convince the President of the United States, who pressed the plan of a barrage across the North Sea until it destroyed 84 per cent of all the submarines captured. That he convinced the prime minister that his idea that submarines could be penned in their bases was wholly erroneous, is interesting in view of the success-

ful accomplishment of the North Sea mine barrage and the blocking of Ostend and Zeebrugge.

It also throws light upon Admiral Sims's persistent opposition to every plan we submitted along this line, and the delay of half a year in inducing the British Admiralty to approve the proposal for a barrage across the North Sea. Lloyd-George was wrong, the Navy Department was wrong, everybody was wrong except Sims and those in the Admiralty who opposed any new plan. After he had convinced the British Prime Minister that he didn't know what he was talking about, it must have been very irritating to Admiral Sims to have our own Navy Department (which was American and, of course, could not have any ideas worth considering) to persist in urging the adoption of an "impossible" plan like the mine barrage.

Admiral Sims ridicules the secrecy of our own Navy Department sending him abroad, but he found the same sort of secrecy in the British Admiralty very impressive, for he says:

The necessity for secrecy which the British Government has experienced, and which I repeatedly encounter in London, and even in the Admiralty itself, is impressive.

Admiral Sims's letter of April 19, 1917, shows very clearly:

1. That the British Admiralty had not adopted the convoy system.
2. That it was pursuing the very opposite policy—that of dispersion of shipping.

3. That the methods the British were pursuing (antisubmarine patrol, etc.) were not succeeding.

4. That the British people generally and even some members of the Cabinet did not realize the seriousness of the submarine warfare.

5. That the British merchant captains opposed the convoy system, and preferred that their ships be armed and allowed to sail singly.

6. That all the officers of rank and actual experience he consulted agreed that the best protection against torpedoes was speed and zigzagging.

7. That there was wide difference of opinion as to the effectiveness of using submarines to fight submarines.

This letter may be taken as a fair example, a little better than the average, of Admiral Sims's communications to the department.

MEASURES HIS DISPATCHES BY THE MILE.

Admiral Sims gave you some idea of the immense volume of dispatches he sent. He said:

I do not know how many dispatches there were, but they are in the hundreds of thousands. I asked my statistician some time ago how many there were, and he said if they were bound up in boards and set on a shelf, that shelf would have to be 140 feet long in order to contain them. Of course, the committee does not want them all.

Out of these miles of dispatches I am only selecting representative ones, and out of those representative ones I am selecting those that illustrate the point in question; and of all of those dispatches, of which there are probably 200,000, I am only selecting a certain number, and these can be included: and if, after my testimony is concluded, you decide that it would be advisable, you can put them in in full; but in the meantime there are only extracts from these dispatches.

The colossal preliminary statement and testimony which Admiral Sims presented to this committee, the reading of which consumed two weeks of your sessions, gave you some idea of his voluminosity. Yet, in his concluding statement he summed up all his testimony and charges in three pages; he tells you that "all the communica-

tions which followed in the next six or eight " months were "mere elaborations and reiterations" of his cable of April 14, and his letter of April 19, 1917. And what recommendations did these contain?

1. That the maximum number of antisubmarine craft and tugs be sent to Europe.
2. That two divisions of dreadnaughts be sent for "moral effect."
3. Advocacy of the convoy system, which had been proposed and was being discussed by the British Admiralty, but not put into effect until months later.
4. The suggestion that it might be useful to send some American submarines for employment against enemy U-boats, as the British were then experimenting along that line.

OTHER THINGS SIMS RECOMMENDED.

While Admiral Sims's first two communications do set forth the chief policies he advocated, they do not embody all his specific recommendations.

These are set forth in his letter of January 7, 1920, and his preliminary statement before this committee. They include the following:

1. That he was constantly urging an increase of forces.
 2. That he was continually calling for a larger staff.
 3. That he recommended the sending of four coal-burning dreadnaughts to the British Grand Fleet.
 4. That he considered that whatever recommendations he made should have been accepted and immediately acted upon.
 5. That he resented the department's insistence upon "full and detailed substantiation of every proposition advanced"; that is, upon being fully informed before important decisions were made.
 6. That all our antisubmarine craft be sent to Europe; that we "strip our coasts of all seagoing protection;" and "repeatedly explained"—listen, gentlemen, I am quoting his words—"that if we could actually entice the enemy into shifting his submarines to our coast it would be greatly to the advantage of the common cause, even granting that our shipping would suffer somewhat more severely."
 7. That he be permitted to enroll in the Naval Reserve as officers such persons as he saw fit; and to promote reserve officers in his discretion.
 8. That he be permitted to select his "subordinate flag commanders," that is, to choose his personal favorites for the most important European commands.
 9. That we boldly move to Paris or London (meaning London) the planning and directing end of our Navy Department "leaving behind in Washington only the organization for insuring support and coordination of home and material effort."
- He did not tell you voluntarily; though it was brought out in cross-examination, that he recommended that the British Admiralty (for that was what he meant, though he camouflaged it by naming Italy and France first) "direct all operations, the others merely keeping the one selected fully informed of their resources available, and submitting to complete control and direction in regard to the

utilization of these resources." Here are his words, in his letter to me July 16, 1917:

It is unquestionable that efficiency would be greatly improved if any one of the Allies—Italy, France, England, or the United States, were selected to direct all operations, the others merely keeping the one selected fully informed of their resources available, and submitting to complete control and direction in regard to the utilization of these resources.

The first course open to us which naturally occurs to mind is that we should look upon our service as part of the combined Allied service, of which the British Grand Fleet is the main body and all other Allied naval forces disposed throughout the world as necessary branches thereof.

This conception views our battleship fleet as a support or reserve of the Allied main body (the British Grand Fleet) and would lead to utilizing our other forces to fill in weak spots of, and to strengthen, Allied lines, both offensively and defensively wherever necessary.

Such a course might be viewed as disintegration of our fleet and it is only natural therefore, that hesitation and caution should be felt in its adoption.

I assure you, Mr. Chairman, that we viewed with hesitation and caution the proposition of turning over the control of the American Navy to any other navy in the world; and we never thought of doing it; and we would have been unworthy as Americans if we had followed the advice given by Admiral Sims.

SIMS'S OWN REPORTS DISPROVE UTTERLY HIS CHARGE THAT DESTROYERS WERE "RUSHED THROUGH BRIEF AND INADEQUATE PREPARATION."

Some of the charges made by Admiral Sims are disproved so completely by his own official reports, which statements in his letter and testimony directly contradict.

For instance, in his letter of January 7, paragraph 78, specification 4, he says:

Destroyers arriving in the war zone, had been cruising extensively off our seaboard and in the Caribbean, and, when war was declared, were rushed through a brief and inadequate preparation for distant service.

As a matter of fact, every report we received called attention to the notably excellent condition in which our destroyers arrived, and Admiral Sims himself, in cables, letters, and reports directed attention to this as a subject of comment and praise. A few extracts from his reports are quoted below:

[Telegram of May 11, 1917.]

6. Our ships made no demands of consequence upon the navy yard facilities after arriving, in spite of the length of their passage under adverse conditions. The commander of the division, when questioned by the vice admiral as to when his vessels would be ready for duty, reported that he should be ready that night, as soon as the ships were refueled * * *.

7. The vessels themselves caused a great deal of complimentary comment, and, contrary to expectations, were found to be well equipped for their prospective duty, with the single exception of "depth charges."

Dispatch May 24, 1917, states that the *Melville* arrived in excellent condition.

[Report of May 26, 1917.]

The Sixth Division arrived on the evening of the 24th of May in excellent condition, no repairs being required.

Dispatch of June 2, 6 p. m., states that the Admiralty desired him to report "officially that the United States destroyer forces

which are working in the Atlantic approaches are rendering most excellent and valuable services."

Report received in the Bureau of Steam Engineering June 18, 1917:

1. It is gratifying to be able to report that the operations of our forces in these waters is proving not only very satisfactory but also of marked value to the Allies in overcoming the submarine menace. The equipment and construction of our ships had proved adequate and efficient.

2. The *Melville* and the destroyers arrived fully prepared for the duty for which they were to be used, and the only additions which have been made to their armament or equipment has been the installation of 300 depth charges. * * *

July 15, 1917, Letter No. 6 announcing the arrival of the *Jupiter* and *Neptune*, convoyed by the *Perkins*, *Jarvis*, *Walke*, and *Sterrett*, states:

All four destroyers arrived here in excellent condition.

Letter No. 38, July 19, 1917, forwards a copy of Commander Pringle's report, in which he states:

All destroyers are generally in splendid condition and there is every indication that they will continue to give efficient service. Since operating with our Allies our destroyers have never failed to meet the schedule laid down for them, and when they have been called on in advance of it they have always responded.

3. * * * It has evidently been a source of considerable surprise and satisfaction to the British authorities to find that our ships have been able to look out for themselves.

4. *Engineering*.—The machinery of all destroyers is generally in very good to excellent condition, and is holding up admirably under the trying conditions it is subjected to.

Report of November 26, 1917, under the heading "Miscellaneous Information Regarding Destroyer Force," Admiral Sims states:

The force commander is particularly gratified to be able to report the manner in which the destroyer flotillas are meeting the war demands placed upon them. A great deal of indirect commendation is heard and received concerning both the efficiency of their operations and the manner in which they stand up to the duty. Within the past week the Admiralty has expressed concern as to whether they are not being driven too hard.

I submit, Mr. Chairman, by his own official statements he conclusively destroys his statement of January 7, when he said they were rushed to distant service inadequately prepared. They were well-prepared and did excellent work, and won commendation from all who saw them in Europe.

TARGET PRACTICE BEFORE THE WORLD WAR.

Was the Navy diligent in making ready before the war? Sims and Plunkett testified in the affirmative as to hitting the target and gunnery. In testimony given before the House Naval Affairs Committee, March 10, 1916, when certain naval officers were trying then, as now, to discredit this Administration, Admiral Sims told this committee that—

In 1912 when I delivered the opening address before the Naval War College extension in Washington I pointed out exactly what had happened, that the target practice, and we then had the first results of it, was an utter and absolute wreck.

This was the year before I became Secretary of the Navy. In 1914 boards of inspection were appointed, "when," Admiral (then Captain) Sims states: "The target practice came up about 40 per cent." Again in 1916, when there was so much discussion of this all-important

work, upon inquiry by a resolution of the United States Senate as to efficiency in target practice, Admiral Sims in a letter to the Secretary of the Navy of July 9, 1916, stated:

Since that time (1913) our shooting has greatly improved, particularly within the last two or three years. As an example of this it may be stated that the improvement in last year's shooting at elementary practice for that and the year before was not less than 40 per cent, thus showing that the curve of improvement was rapidly ascending.

You have heard Admiral Plunkett tell you of the improvement in gunnery and battle practice in the Navy immediately prior to our entrance in the war. In addition to his testimony before your committee, I wish to give your committee the statement made by the director of gunnery exercises (Admiral Plunkett) and engineering performances in 1916 and furnished by me on December 11, 1916, to the House Naval Affairs Committee. It will be found on pages 728-729, "Hearings Before Committee on Naval Affairs, Sixty-fourth Congress, Second Session," and my statement for request for additional appropriations, including Capt. Plunkett's report. It is as follows:

In connection with the increase in the appropriation for gunnery and engineering exercises from \$135,000 to \$205,000, I wish to speak of the steady improvement in the battle practice of the fleet during the last year. From all quarters come reports of enthusiastic and increased interest, which means better scores and better records.

At no time in the history of the Navy—

Says Admiral Plunkett—

has the entire personnel been so keen and alert to break former records, and the achievements of the year give promise that each succeeding performance of the fleet will equal and probably surpass the unprecedented accomplishments of the last 12 months. The following statement, prepared by the director of gunnery exercises and engineering performances, shows how really wonderful the progress of this period has been:

The results of the various forms of battle practices with guns and torpedoes, as reported herein, show a creditable improvement over those of a similar character conducted last year.

During the gunnery year 1916, 12 vessels of the battleship class, 27 vessels of the destroyer class, 24 vessels of the submarine class, and 21 vessels of the cruiser and gunboat classes, completed all forms of gun and torpedo practice prescribed for the year. All forms of gun practice were completed by 14 vessels of the battleship class and 21 vessels of the cruiser and gunboat classes. Twenty-eight destroyers and 25 submarines completed all forms of torpedo practice. Thirty-four destroyers fired day battle practice with torpedoes and 25 submarines. In all cases where vessels in commission failed to complete all forms of practice satisfactory reasons were given and involved repairs or material changes compelling the vessel to go to a navy yard, and thus lose the opportunity to fire, or to place in the active fleet being taken by newer vessels, placed on the reduced complement basis.

The general results are fully up to the expectations of the department, and again show that steady improvement in the natural consequence of a more concentrated effort on the part of those responsible for personnel and material.

The gun practice of the battleships was carried out at ranges far in excess of any heretofore prescribed, the closest comparison being that of the year 1914, when full charges were used as was done this year. The day individual practice was conducted at a mean range of over 15,000 yards with the main battery guns of 1916, as compared with the mean range of 10,000 yards with the same guns in 1914. The percentage of hits was not only maintained but showed a slight increase in spite of over 50 per cent increase in range.

This was over a year before we entered the war. Practically the same number of ships were fired in both years. The Department does not consider the rate of fire with the large-caliber guns to be entirely satisfactory, the tendency being to wait the fall of all the shots from each salvo. The orders for gunnery exercises this year intend that when a straddle or bracket has been established the rate of fire should include at least half the guns engaged in and actually firing. A comparison

with 1915 is not made as reduced charges were used and consequently materially shorter actual ranges prescribed.

A comparison of the results of the torpedo-defense practices of one year with that of another is difficult, owing to the continual change necessary in the orders for conducting the practice, in the desire to try out all possible methods of solving this difficult problem. The 5-inch gun is gradually displacing all other calibers for torpedo-defense purposes as the dreadnaught type displaces the predreadnaught in the active fleet. Greater efforts than ever must be made to render this form of firing more effective, and with the adoption of standard methods of control and its proper supervision the department expects a material improvement. The introduction of day firing with the torpedo-defense battery should develop many weaknesses heretofore shrouded in the cover of darkness, and with improved searchlights and greater effort on the part of personnel a considerable improvement should be had.

A marked improvement is noted in the battle torpedo practice of the battleships for the last year over that of previous years. This most important element of offensive strength is receiving the attention it deserves as indicated by the remarkable increase in the percentage of hits at increased ranges. With increased accuracy and reliability due to greater experience and higher intelligence of the personnel, results which have been considered more or less problematical are now, the department is pleased to note, matters of common accomplishment.

The torpedo practice of the destroyers showed a very material and satisfactory increase in the performances of all ships. Nearly three times as many torpedoes were fired in 1916 as in 1915, and on the battle practice where 146 torpedoes were fired this year none were lost, and the percentage of torpedoes performing properly showed a substantial increase due to greater skill of personnel, and is very gratifying to the department.

The destroyer forces are maintaining a satisfactory improvement with their guns. The 4-inch gun as now mounted in the destroyers has established its superiority over the 3-inch gun, and the department expects further material improvement and an increased percentage of hits, in spite of the well-known difficulties under which destroyers use their guns.

The submarines also show a very decided improvement, nearly twice as many torpedoes being fired this year as last, and the increase of 70 per cent of hits on the battle practice is deserving of more than passing notice. It is realized that with the improvement in the character of the material a corresponding increase in efficiency would be expected.

The gun practice of the cruiser and gunboat classes was carried out under orders similar to those of the other classes, and quite different from that obtaining heretofore, but being a marked improvement in that all classes of vessels now conduct gun practice under conditions simulating actual battle. The results are entirely satisfactory. The department having prescribed orders for gun practice for vessels of the train, this form of practice was carried out by all the auxiliaries having guns mounted and equipped with naval crews. As a result of bringing all classes of vessels into the gunnery work of the year, greater interest throughout the service is stimulated, and defects and weaknesses as they develop from time to time can be dealt with and corrected instead of waiting until actual conditions of war exist and serious defects may be beyond correction.

(Thereupon, at 12 o'clock m., the subcommittee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The subcommittee reconvened, pursuant to the taking of the recess, at 2 o'clock p. m., Senator Frederick Hale (chairman), presiding.

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

The CHAIRMAN. Mr. Secretary, will you proceed?

Secretary DANIELS. When the committee adjourned at noon, Mr. Chairman, I had read a statement showing the great improvement in target practice in the United States Navy before the World War, showing from Admiral Sims that it improved from 1912 to 1916 40-

per cent, which is the best evidence possible that the Navy was in better condition for a war than it had ever been; and I have read also from Admiral Plunkett, showing the marked improvement in every line of gunnery.

THE BATTLE OF JUTLAND AND THE CONDITION OF THE BRITISH FLEET.

The British Navy is the biggest in the world and more hundreds of millions of dollars were spent on it before 1914 than upon any other navy. Its avowed policy was to be twice as powerful as that of Germany in the hope and belief that such a preponderance would either prevent war or assure naval victory if war came. There was but one naval battle in which the British and German Navies were engaged in full force, comprising ships of all classes—the battle of Jutland. Reams have been written on that battle and more reams will be written when all the German reports are available, and naval experts will disagree and debate for a decade, telling us what might have happened if this or that had or had not occurred. It is not necessary to discuss the battle, except I may say it is known to all that the German Fleet did not come out again to try conclusions.

In his interesting story of the Battle of Jutland, Admiral Jellicoe, one of the best naval officers in the world, makes a number of statements which show that not even the British Navy, expecting every minute a decisive battle, and therefore compelled to keep its fleet in readiness, could be 100 per cent perfect. He shows that the British fleet in the Battle of Jutland did not have the preponderating strength the world supposed. He also frankly admits certain deficiencies and weaknesses which surprised the people of Great Britain and the world which had supposed the British Navy was far superior to Germany's in every unit of fighting strength, including destroyers, and yet Admiral Jellicoe makes these statements:

This country had in home waters at the same period only 76 destroyers that could be compared with the German vessels in view of modern requirements, and 33 of these had a speed of only 27 knots.

We were very short of destroyers for fleet work, and we were well aware of the thoroughness of the defenses of the German naval bases. We knew that they not only possessed the most powerful and ample artillery defenses, but we knew also that the Germans had a very efficient mining service, and they were justified in assuming that they had protected their naval bases by extensive mine fields. We, on the other hand, were entirely unprovided with this particular form of defense.

Another factor in this matter was the knowledge that our enemy was almost certain to possess a very considerable superiority over us in the number of destroyers likely to be present during a fleet action. (A German destroyer usually carries six torpedoes. Few British destroyers carried more than four torpedoes up to the year 1917, although they mounted a much heavier gun armament than their enemies.) Our fears were realized, particularly during the first two years of the war.

We had not built an adequate number of destroyers in the years before the war to meet the many needs that only this class of vessel could fulfill, particularly as the enemy developed his submarine warfare against merchant ships. (This with regard to the superiority in numbers of the German fleet at the end of May, 1916.)

Although, in spite of the great destroyer program initiated by Lord Fisher at the end of 1914, the shortage of destroyers was most seriously felt throughout the whole war. The conditions would probably have been even worse had the prewar program of light cruisers been sacrificed to maintain the output of destroyers to the standard desired by the Admiralty.

They (the Germans) possessed, in comparison with the uses for which they were required, almost a superfluity of destroyers, certainly a superfluity as compared with ourselves, and they could not have put them to a better use than in an attack on Scapa Flow during the early months of the 1914-15 winter.

Touching upon the ordnance and the shell used by the British in that engagement, Admiral Jellicoe says:

The Jutland battle convinced us that our armor-piercing shell was inferior in its penetrative power to that used by the Germans.

With one of the old type of armor-piercing shells of a particular caliber as used at Jutland the shells would, with oblique impact at battle range, break up whilst holding a certain thickness of plate, and the shell could not, therefore, reach the vitals of the enemy's ships.

Had our ships possessed the new type of armor-piercing shell at Jutland, many of the enemy's vessels, instead of being only damaged, would probably not have been able to reach port.

As against the additional protection of the German ships our vessels of contemporary design were provided in all cases with heavier turret guns, whilst the German ships carried heavier secondary armament.

With reference to armor and the relative protection of British and German battleships, Lord Jellicoe says:

The main belt and upper belt armor of the German ships was in nearly all cases thicker than in their British contemporaries, whilst the protection at the bow and stern was in all cases greater in the German ships.

The deck protection in the German ships was usually greater than in the British vessels and the water-tight divisions more complete.

The German ships carried a greater number of submerged torpedo tubes than the British vessels.

(The next five paragraphs refer to battle cruisers in Battle of Jutland.)

The earlier German battle cruisers were of greater displacement than their British contemporaries.

Five of our nine battle cruisers were without protection above the main deck, the whole of the German vessels being provided with protection to the upper decks.

The German ships carried a greater weight of armor than their British contemporaries.

The German vessels possessed thicker armor in all positions, including deck protection, as well as more complete water-tight subdivisions.

The German ships carried a greater number of submerged tubes than the British ships.

It was well known at the Admiralty that the German superiority lay in greatly increased protection, combined with heavier torpedo armament.

The German ships carried a much greater weight of armament than their British contemporaries.

All German dreadnaughts were provided with side armor to the upper deck, while nine of the earliest British dreadnaughts were provided with armor protection to the main deck only, thus rendering them far more open to artillery attack.

Admiral Jellicoe, with a frankness that shows he is far from making claims for perfection, points out that the Germans had certain other advantages; for example, he says:

It was, however, known to me that neither our searchlights nor their control arrangements were at this time of the best type. The fitting of director-firing gear for the guns of the secondary armament of our battleships (a very important factor for firing at night) had also only just been begun, although repeatedly applied for. The delay was due to manufacturing and labor difficulties.

The greater efficiency of German searchlights at the time of the Jutland action, and the greater number of torpedo tubes fitted in enemy ships, combined with his superiority in destroyers, would, I knew, give the Germans the opportunity of scoring heavily at the commencement of such action.

There is no doubt at all that the German organization for night action was of a remarkably high standard. In the first place, the use of star shell, at that time unfamiliar to us, was of the greatest use to them in locating our destroyers without revealing their own positions; and, secondly, their searchlights were not only very powerful (much more so than ours), but their methods of controlling them and bringing guns and searchlights rapidly onto any vessel sighted was excellent.

- The lessons which the British Navy learned by the Battle of Jutland were at once applied to their ships, the Admiralty wisely hastening to take advantage of any superiority noted in the German ships. How this was promptly done, Admiral Jellicoe tells us in the following extract from his work:

The ships which had received damage in the Jutland action had to be repaired without delay. * * * Whilst under repair, the opportunity was taken of effecting certain alterations which experience gained in the action had shown to be desirable. The principal points affecting material to which attention was directed were:

(a) The urgent need for arrangements to prevent the flash of cordite charges, ignited by the explosion of a shell in a turret or in position between the turret and the magazine, being communicated to the magazine itself. It was probable that the loss of one, if not two, of our battle cruisers was due to this cause, after the armor had been pierced.

(b) Better measures were required to prevent the charges of small guns from being ignited by bursting shell, and to localize any fires due to this cause, in the case of guns of the secondary battery in large ships, and the main armament in small ships.

(c) Increased deck armor protection in large ships had been shown to be desirable in order that shell or fragment of shell might not reach the magazine.

(d) The pressing need for a better armor-piercing projectile with an improvised tube was also revealed.

(e) Improved arrangements for flooding magazines and drenching exposed cartridges had to be made.

Some delay occurred in improving our range finders. The majority had been installed in the fleet before the great increases in the range had come about as the result of experience during the war.

Discussing fully the condition of his ships and the defects which weakened the British fleet Admiral Jellicoe writes, October, 1914:

The Grand Fleet was considerably weakened at this time apart from the loss of the *Audacious*.

(NOTE.—This reference is to one of the most modern of the British battleships sunk by a mine in October.)

The *Ajax* had developed condenser defects; the *Iron Duke* had similar troubles; the *Orion* had to be sent to Greenock for examination of the turbine supports, which appeared to be defective; the *Conqueror* was at Devonport refitting, and the *New Zealand* was in dock at Cromarty. The *Erin* and *Agincourt*, having been newly commissioned, could not yet be regarded as efficient, so that the dreadnaught fleet only consisted of 17 effective battleships and 5 battle cruisers; the German dreadnaught fleet at the time comprised 15 battleships and 4 battle cruisers, with the *Blucher* in addition. The margin of superiority was, therefore, unpleasantly small in view of the fact that the High Sea Fleet (German) possessed 88 destroyers and the Grand Fleet (British) only 42.

First part of November, 1914: The rear admiral commanding the tenth cruiser squadron reported that all his ships, which were very old, were showing increasing signs of needing thorough repair at a dockyard, and arrangements were put in hand for sending them, three at a time, to the Clyde. In addition, the *Antrim*, of the third cruiser squadron, reported condenser defects; the *Drake*, of the sixth cruiser squadron, was at Scapa making good defects, which were constantly developing, and the *King Alfred* and *Leviathan*, of the same squadron, were refitting at dockyard ports.

During the gale on November 12 the ships of the tenth cruiser squadron—the old *Edgar* class of cruisers—which were on patrol between the Shetland and the Faroe Islands had suffered much damage, many of them showing signs of leaking and straining; boat and ventilators were washed away; and water in large quantities found its way below. It became evident that these old ships were not sufficiently seaworthy to withstand the winter gales of northern latitudes without first undergoing a thorough repair, and arrangements were made for sending them, three at a time, to the Clyde for survey and refit.

On December 12, 1914, serious defects in the boilers of the *Liverpool* became apparent and the speed of the ship was limited to 17 knots. This defect, which first showed itself in this ship, gradually affected the boilers of the same type in all ships so fitted, as they experienced a certain degree of wear, and from this time onward there was

usually one, and occasionally two, light cruisers paid off for the purpose of carrying out the necessary repairs which occupied a period of two or three months. This reduction in the number of efficient light cruisers was serious at a time when our numbers compared badly with those possessed by the enemy.

Lord Jellicoe, with equal frankness, tells of certain disadvantages other under which the British Navy labored, saying as to what is now considered as all important:

The comparative inefficiency of the wireless installation in our submarines, and to a lesser extent in our destroyers, was one of the disadvantages which we had to face during the first two years of war.

Late in 1916 he wrote that "it did not appear that new proposals and inventions for dealing with the submarine campaign were being pushed forward with the necessary rapidity," and he added: "Generally it seemed doubtful whether the danger confronting us would be successfully combatted."

But I must not quote further, except to add two paragraphs which apply to the United States even greater than to Great Britain:

1. In spite of the continual rise in the estimates there was never sufficient money to meet all the Admiralty's needs.
2. Naval policy is pursued in peace conditions under inevitable disadvantages in a democratic country, because there are many claims on the exchequer.

Until 1916 the United States had never entered upon a really constructive and systematic program for its Navy, and before that date appropriations were made from year to year. In 1912, for example, Congress authorized two dreadnaughts, in 1913 only one, in 1914 three, in 1915 two, and in 1916 authorized the three-year program for the construction of 156 ships to cost over \$500,000,000. None of these ships, authorized in August, 1916, were ready when we entered the war, though the contracts were made for a number of them immediately after the naval bill had become a law, August 29, 1916.

The CHAIRMAN. Does that refer simply to the 1916 class, or to the others that were authorized in 1914, 1915, and 1916?

Secretary DANIELS. None of these ships were authorized in the 1916 program; but up to that time "there never was sufficient money to meet all the Navy's (Admiralty's) needs," because "in a democratic country there are many claims on the Treasury (exchequer)."

WHAT GERMANY LEARNED.

We have not yet had the same frank and refreshing statement from the high German naval officials that Lord Jellicoe has given. In due time all will be told, and we shall then learn from the German authority wherein they found their ships inferior to the British and how upon their return to base they made the improvements which their failure to win the Battle of Jutland showed them should be made. We shall no doubt see then that they learned lessons of importance from British superiority in certain particulars.

WHAT OUR NAVY LEARNED.

We know that when we entered the war our department requested our Allies to furnish us with all they had learned in their larger experience, and orders were given immediately to adopt all the improvements that would give greater efficiency to our ships. We

also adopted in operation and tactics all the new and better things war had demonstrated were good.

All this teaches, and I use these statements only to show that no navy is perfect either in the construction of ships, in its ordnance, in its operation, or in its personnel, and that every navy that is open-minded learns not only from its Allies but also from its foes.

This lesson also teaches that our General Board is acting wisely in studying all the lessons of the war and that these lessons are being applied by the department to make our Navy equal in every respect to any navy in the world.

Finally, the illuminating and frank statement by Admiral Jellicoe shows that the criticisms of any lack of perfection in our Navy—material, personnel, and operation—apply quite as truly to the navies of countries which have spent millions to our thousands, and which had felt for years the compulsion of readiness to fight a near neighbor any day.

THE CRITICAL AREA—AS AMERICAN DESTROYERS REACHED QUEENSTOWN, BRITISH DESTROYERS WERE WITHDRAWN.

It is far from my purpose to criticize the British Admiralty or their conduct of the war. It was a pleasure to me and to the Navy to work with them as "comrades of the mist," and I regret that the unjustifiable charge against American naval operation by Admiral Sims makes it necessary to make a statement as to the utilization of certain ships of the British Fleet. It is done in justification of the American Navy. His sharp criticism in that the Navy Department did not at once send all its destroyers and like craft into what he calls the "critical area" based on Queenstown, and he charges because of this American failure 500,000 lives were lost, \$15,000,000,000 destroyed, and the war was prolonged several months. I call the attention of the committee that this wild and unfounded statement has been declared "preposterous" by some, and without foundation by every admiral who held responsible positions during the war and by Capt. Pratt, Assistant Chief of Operations; but of that I treat more fully elsewhere in my statement.

Was the base at Queenstown the only "critical area," and is Admiral Sims justified in saying all our destroyers would have been sent immediately into that "critical area" and kept there? We sent six before Admiral Sims suggested sending any, and by July had 34 out of our possible 50 in that "critical area."

If it was necessary to concentrate all our destroyers immediately at that point to prevent the loss of 500,000 lives and \$15,000,000,000 of money, all fair-minded men will ask: Why did not the British Navy concentrate its destroyers at that "critical area" and thus help save all those lives and those billions of dollars? What did the British Admiralty do with reference to that "critical area" in those days when shipping was being sunk so fast? Admiral Sims has told you that they actually withdrew their destroyers from that "critical area" when our destroyers arrived, at a time when tonnage was being sunk at the peak of destruction in the region around Queenstown base. In answer to an inquiry as to the number of destroyers Great Britain had in the summer of 1917 (the period in which Sims

says sinkings were greatest), the Chief of the Office of Naval Intelligence furnishes this memorandum:

WASHINGTON, April 22, 1920.

Memorandum for the Secretary of the Navy:

Great Britain had 361 destroyers in commission on June 30, 1917, of which 68 were old destroyers which had been launched before 1902, and 293 were newer destroyers, that is, launched after 1902.

A. P. NIBLACK.

In answer to an inquiry as to how many British destroyers were based on this "critical area," the Chief of the Office of Naval Intelligence furnishes this memorandum:

WASHINGTON, April 22, 1920.

Memorandum for the Secretary of the Navy:

The following is a tabulated statement of the British destroyers under the command in chief at Queenstown, Ireland, based on Queenstown during the period named:

April 1, 1917, none; May 1, 1917, none; June 1, 1917, 1; July 1, 1917, 4; August 1, 1917, 2; September 1, 1917, none; October 1, 1917, none.

A. P. NIBLACK.

According to Sims the sinkings were greatest from April to the fall of 1917, so serious that he charges the Navy Department's failure to send all its ships there in April and the immediately succeeding months (we sent 34 out of our total of 50) cost 500,000 lives. And yet—and this fact is perfect refutation of his sweeping charges—the British did not base a single one of their destroyers on Queenstown either in April or May, 1917, only one in June, four in July, two in August, and not a single one either in September or October, 1917. We sent 34 into that "critical area" where millions of tons of shipping were sunk, and as our destroyers arrived British destroyers were withdrawn, while the destruction of tonnage was greatest.

If a few more destroyers could have saved 500,000 lives (an absurd and ridiculous statement), I do not doubt that the British Admiralty would have strained a point to have sent at least one to the critical area in April and May, when they had none, and more in June when they had only one. We had 34 in July and the British increased to four in that month. They sent two away in August, and they withdrew all they had in that "critical area." The British had 361 destroyers in June, 1917. I can not believe the Admiralty would not have taken some of the 361 to send into the "critical area" if they had believed that by so doing they could have shortened the war four months, saved 500,000 lives, and saved \$15,000,000,000. In comparison with doing so much in that area no other destroyer duty could have done so much.

If Admiral Sims's wild and reckless statement is correct, and his figures of our part in the war accurate, the British Navy's failure to send destroyers into that "critical area" makes it responsible for 95 to 97 per cent of the 500,000 lives lost and the American Navy responsible for only from 3 to 5 per cent. But both navies are free from this indictment, for if both had sent all the destroyers they had to that Queenstown area it would have required 24,589 more destroyers to have patrolled it sufficiently to save all those lives. In answer to a question asked in London by Chairman Padgett, "What can Congress do to help?" Admiral Sims, in the summer of 1918, answered: "Send us 25,000 destroyers." The failure to send 25,000 destroyers can not be laid at the door of the Navy Department when Great

Britain and the United States together after years of building had only 411 between them.

SIMS LET BRITISH ADMIRALTY DETERMINE AWARDS TO UNITED STATES NAVAL VESSELS—THEY GOT SCANT CREDIT FOR SINKING OR DAMAGING SUBMARINES.

Mr. Chairman, instead of making his own independent inquiry into reports of our commanders that submarines had been damaged or sunk, Admiral Sims, according to the statement issued by his own headquarters, submitted such reports to the British Admiralty and accepted the Admiralty's awards.

Regarding "Encounters with enemy submarines," the "Summary of activities of United States naval forces operating in European waters," compiled by and issued from Admiral Sims's headquarters in London, states:

It can be easily understood that it was very difficult during the war to verify the results of attacks on enemy submarines. A track of enemy submarines, while operating at sea, was kept by plottings of sightings and sinkings, by intercepted wireless messages, and by other information from secret service sources. However, unless prisoners or unmistakable wreckage was obtained following an attack it was practically impossible to definitely determine the results of the attack.

I call your attention particularly to this paragraph, now [continuing reading]:

Reports of all attacks by United States Navy vessels were submitted to the British Admiralty the same as in the case of British ships and awards of British Admiralty were accepted.

A total of over 256 attacks by United States vessels occurred. In 183 of these cases there was definite chart evidence of a submarine in the vicinity. In the other cases doubt existed.

It is often very difficult to determine the result of an attack, and the official classification is sometimes found to be in error; therefore, the following figures are certainly not exaggerated and may be somewhat underestimated. United States vessels have been officially accredited with 24 successful attacks on enemy submarines. The degree of success in these attacks varies between "slightly damaged" and "known sunk."

OF 256 ATTACKS REPORTED, 24 WERE CLASSED AS SUCCESSFUL.

That is, out of 256 attacks on submarines by the United States naval vessels under his command, in 183 of which cases there was "definite chart evidence of a submarine in the vicinity," they were given credit for only 24 "successful attacks," most of these being listed by the admiralty as resulting in the U-boat being "possibly slightly damaged."

This "summary" gives the following "list of ships participating in these attacks, the names of their commanding officers, and the classification of the attacks."

O'Brien, Lieut. Commander C. A. Blakely, June 16, 1917. "Possibly slightly damaged." (Admiralty classification.)

Trippe, Lieut. Commander Giffen, July 9, 1917. "Possibly slightly damaged." (Admiralty classification.)

Warrington, Lieut. Commander G. W. Kenyon, July 13, 1917. "Possibly slightly damaged." (Admiralty classification.)

Jenkins, Lieut. Commander H. D. Cook, July 17, 1917. "Possibly slightly damaged." (Admiralty classification.)

Wadsworth, Lieut. Commander J. K. Taussig, July 21, 1917. "Possibly slightly damaged." (Admiralty classification.)

Cummings, Commander George Neal, July 26, 1917. "Possibly slightly damaged."
Wilkes, Lieut. Commander J. C. Gremont, July 26, 1917. "Possibly slightly damaged." (Admiralty classification.)
Wardworth, Commander J. K. Taussig, Lieut. Commander Giffen, July 29, 1917. "Possibly slightly damaged." (Admiralty classification.)
Benham, Lieut. Commander J. R. Gay, July 30, 1917. "Probably seriously damaged." (Admiralty classification.)
Purker, Commander W. Brown, August 3, 1917. "Possibly seriously damaged." (Admiralty classification.)
Jacob Jones, Lieut. Commander D. W. Bagley, September 5, 1917. "Possibly slightly damaged." (Admiralty classification.)
McDougal, Commander W. T. Conn, September 9, 1917. "Possibly slightly damaged." (Admiralty classification.)
Davis, Commander W. V. Tomb, September 21, 1917. "Possibly slightly damaged." (Admiralty classification.)
Pathfinder, September 27, 1917. "Possibly slightly damaged." (Admiralty classification.)
Conyngham, Commander A. W. Johnson, October 19, 1917. "Possibly slightly damaged." (Admiralty classification.)
Fanning, Lieut. A. S. Carpenter; *Nicholson*, Commander F. D. Berrien; November 17, 1917. "Known sunk, U-58." (Admiralty classification.)
Nomz, Lieut. Commander L. R. Heahy; *Wakiva*, Lieut. Commander G. E. Davis; *Piqua* (ex-*Kanawha II*), Lieut. Commander H. D. Cooke; November 28, 1917. "Probably seriously damaged."
Allen, Commander H. D. Cooke, February 2, 1918. "Possibly slightly damaged." (Admiralty classification.)
Reid, Lieut. Commander C. C. Slayton, March 18, 1918; *Isabel*, Lieut. Commander H. E. Shoemaker. "Possibly slightly damaged."
Stewart, Lieut. H. S. Haislip, April 23, 1918. "Probably seriously damaged."
Porter, Lieut. Commander W. H. Lee, April 28, 1918. "Probably seriously damaged." (Admiralty classification.)
Patterson, Lieut. S. S. Lewis; *Beale*, Lieut. Commander C. T. Blackburn; *Burrows*, Lieut. Commander H. V. McKittrick; *Allen*, Commander H. D. Cooke; May 19, 1918. "Possibly slightly damaged." (Admiralty classification.)
Christabel, Lieut. Commander M. B. McCord, May 21, 1918. "Submarine interned at Santander, U-boat 56, as result of attack." (Admiralty classification.)
Lydonia, Lieut. Commander R. P. McCullough; *H. M. S. Basilisk*; May 8, 1918. "Known sunk, U-boat 70." (Admiralty classification.)
Sterrett, Lieut. Commander A. S. Farquhar, June 1, 1918. "Possibly slightly damaged."
United States submarine *A L 2*, Lieut. P. F. Foster, July 10, 1918. "Known sunk, U-boat 65." (Admiralty classification.)
Subchasers, *Corfu*, Ensign G. J. Luvy, U. S. N. R. F. 95; Ensign E. Hazard, U. S. N. R. F. 179; Ensign J. M. Beverly, U. S. N. R. F. 333; July 10, 1918. "Possibly sunk." (Admiralty classification.)
Sub. chasers *Plymouth*, 84 Ensign E. F. Williams, U. S. N. R. F.; 85 Ensign A. B. Baker, U. S. N. R. F.; 86 Ensign G. H. Lane, U. S. N. R. F.; July 10, 1918. "Possibly slightly damaged." (Admiralty classification.)
Tucker, Lieut. Commander W. H. Lassing, August 8, 1918. "Possibly sunk."
Paducah, Capt. W. T. Wheeler, C. G., September 9, 1918. "Possibly slightly damaged." (Admiralty classification.)

It will be noted that there are only three cases classed as "known sunk." Of these but one full credit for sinking a submarine is given, that to the *Fanning* (assisted by the *Nicholson*), which proved conclusively the sinking of the U-boat 58 by bringing in the German crew as prisoners. The *Lydonia* shares with the British ship *Basilisk* the credit of sinking the U-boat 70. The United States submarine *A L 2* was not credited with actually sinking the U-boat 65, which was wrecked supposedly by the explosion of one of her own torpedoes, but the American submarine, which by a daring crash dive prevented the German submarine from recovering or coming to the surface, was credited with witnessing the sinking of the U-boat 65.

In the British Admiralty's final "submarine losses return," issued in January, 1918, which covered losses of all German submarines during the war, two credits are given United States vessels, as follows:

U. 58—17-11-17, 5137 N., 0812 W. (U. S. S. *Fanning*).

U. B. 70—8-5-18, 3808 N., 0302 E. (H. M. S. *Basilisk* and U. S. S. *Lydonia*).

The U. B. 65, which one might judge from the Sims's headquarters list, was credited to the United States submarine *A L 2*, is listed thus:

U. B. 65—10-7-18, 5107 N., 0942 W. (Accident.)

Elsewhere in that report it was stated that the sinking of the U. B. 65, being confirmed from various sources, the previous classification, "U. B. 65, July 10, 1918; explosion witnessed by *A L 2*. Probably sunk," had been altered to "Known."

LIST REPORTED BY LONDON HEADQUARTERS.

The following dispatch from United States naval headquarters in London, January 29, 1920, was received in response to a request from the Bureau of Navigation to "Submit list of United States vessels credited with destroying or damaging enemy submarines":

JANUARY 29, 1920.

From: Simsadus, London.

To: Opnav.

4027 your 6403-1710, Admiralty classification of actions of American ships destroying or damaging, latitude and longitude given to nearest degree. All latitudes north longitudes west except when stated otherwise.

Known: U. S. S. *Fanning* and steamship *Suffolk*, November 17, 1917, latitude 52°, longitude 8°; U. S. S. (S. P.) *Lydonia* (with H. M. S. *Basilisk*), May 8, 1918, latitude 38°, longitude 3° east.

Probably seriously damaged: U. S. S. *O'Brien*, June 16, 1917, 12' south of Ballycotton Light; U. S. S. *Cummings*, June 26, latitude 47°, longitude 6°; U. S. S. *Wadsworth*, July 29, latitude 49°, longitude 11°; U. S. S. *Benham*, July 30, latitude 50°, longitude 7°; U. S. S. *Parker*, August 3, latitude 52°, longitude 15°; U. S. S. *Porter*, April 28, 1918, latitude 49°, longitude 6°; U. S. S. *Christabel* (S. P.), May 21, latitude 47°, longitude 3°; *Conyngham*, October 19, latitude 48°, longitude 9°.

Possibly slightly damaged: U. S. S. *Winslow*, June 11, 1917, latitude 51°, longitude 9°; U. S. S. *Cummings*, July 18, latitude 52°, longitude 12°; *Navajo*, July 5, latitude 50°, longitude 3°; U. S. S. *Tripp*, July 9, latitude 51°, longitude 12°; U. S. S. *Warrington*, July 13, latitude 51°, longitude 9°; U. S. S. *Jenkins*, July 17, latitude 51°, longitude 13°; U. S. S. *Wadsworth*, July 21, latitude 50°, longitude 16°; U. S. S. *Wilkes*, July 26, latitude 47°, longitude 13°; two destroyers (acting with airship C 2 and two British destroyers), August 9, 15' southeast of Lizard Head, England; *Jacob Jones*, September 5, latitude 52°, longitude 7°; U. S. *Allen*, February 2, latitude 54°, longitude 5°; Seaplane 1616, May 16, latitude 51°, longitude 5°; U. S. S. *Allen*, U. S. S. *Patterson*, etc., May 19, latitude 53°, longitude 5°; S. C. No. 84, and S. C. No. 86, July 10, latitude 50°, longitude 5°; three units submarine chasers; steamship *Waalhaven*, latitude 50°, longitude 6°; U. S. S. *Paducah*, with H. M. S. *Sweetbriar*, September 19, latitude 39°, longitude 5° east; seaplane from Lough Foyle Naval Air Station, October 19, latitude 56°, longitude 8°.

Total, 2, 8, and 21. (1130-497.)

6403-1700, from Bunav: Submit list United States vessels credited with destroying or damaging enemy submarines.

So that is the credit our forces received—two "known sunk," one by the *Fanning*, which could not be questioned, as the crew was captured; one by the *Lydonia* assisting the British ship *Basilisk*; 8 "probably seriously damaged"; 21 "probably slightly damaged."

SOME EXAMPLES OF ENCOUNTERS OF UNITED STATES NAVAL VESSELS
WITH SUBMARINES.

Gentlemen, don't for a moment conclude, from the few credits awarded, that our destroyers and other vessels in European waters did little effective work against submarines. The fact that 256 attacks were reported proved that they were "going after the subs" constantly, and their reports show not a few very lively encounters, in spite of Sims's statements that our Navy "was not in this war in a fighting sense," and that our vessels were merely "serving as motor lorries behind the Army."

The reports of submarine encounters would make a volume, and I can assure you that some day they will be printed, and the officers and men of our Navy will be given due credit for the work they did. If I had had any idea that Admiral Sims had not provided for this, he would have been sent a peremptory order to make his own investigation of each case, and forward to us his conclusions. The United States Navy is not accustomed to having others decide what credits shall be awarded to its own men and vessels, and I know of no instance in which any other navy has allowed this. In making this statement I have no criticism of the British Admiralty. It was not their business to keep check of attacks by naval vessels. It was our business. It was Admiral Sims's neglect which up to the present time has denied the honor and the reward which belongs to commanders of American ships.

Below are given reports of a few of the encounters of United States destroyers and patrol vessels with submarines, which will give you some idea of the work they did:

U. S. S. "O'BRIEN,"

QUEENSTOWN, IRELAND. June 19, 1917.

From: Commanding officer.

To: Commander in chief, coast of Ireland.

Subject: Report of contact with enemy submarines.

1. At 4.21 in the afternoon of June 16, 1917, in the approximate position 12 miles south of Ballycotton Light, convoying the steamship *Elysia*, a periscope of a submarine was sighted broad on the starboard bow, distant about 800 yards, the submarine being about two points on the starboard bow of the convoy. Speed was immediately increased to 20 knots and this ship was headed toward periscope, which about this time disappeared. The ship was steadied on the approximate position and after a very short period of time the periscope was again sighted dead ahead, distant opposite direction to the *O'Brien*.

The periscope showed for only a few minutes. A few seconds later the lookout in the foretop called out that he saw the bulk of the submarine in the water passing aft close on our starboard side. He stated later that he thought we were going to ram it. He could clearly see the submarine and watched it gradually disappear below the surface until it was abaft the after deckhouse. At this moment a depth mine was let go and it is believed that the depth charge came within the prescribed limit where serious damage results from the explosion. The spot was circled immediately after the explosion, but no evidence of the submarine could be found. After circling about the spot for a few minutes, the *O'Brien* resumed her position ahead of the steamship *Elysia* and continued to escort her.

C. A. BLAKELY.

ADMIRAL SIMS'S GENERAL REPORT CONCERNING SUBMARINE SITUATION
IN EUROPEAN WATERS.

JUNE 20, 1917.

12. Area Queenstown, Irish Sea.

It is reasonably certain now that the *O'Brien* destroyed the submarine mentioned. She was escorting a valuable ship when the two periscopes of a submarine were observed about 800 yards on her bow. She altered course immediately, headed for it, and increased to full speed. The periscopes were again seen about a minute later about 100 yards dead ahead, the submarine having apparently attempted to avoid the *O'Brien* and torpedo her escort astern of her. From the last position sighted, the submarine apparently started to dive, and must have barely escaped being rammed.

The lookout on the top observed her hull distinctly alongside the *O'Brien* and gradually disappearing as she proceeded downward, on almost exactly the opposite course to the *O'Brien*. A depth charge was dropped when the submarine was under the after deckhouse, and although the *O'Brien* was making 20 knots by this time, less than three minutes after the submarine had been sighted, the explosion of the depth charge gave the ship a very severe shaking. The *O'Brien* circled over the spot, but saw no evidence of damage. A British destroyer passing over the same spot nearly three hours later found and reported large patches of strong-smelling oil. The *Cushing*, on the following morning, passed the same area and also reported a large amount of oil. This incident occurred just off the Queenstown entrance and was unfortunately one of those cases the exact results of which can not be determined. (Credit given by Admiralty: "Possibly slightly damaged.")

Now, Admiral Sims says it is reasonably certain that that submarine was destroyed. The British Admiralty says, "Possibly slightly damaged." I prefer the statement made by Admiral Sims on June 20, 1917, at the time when all the evidence of the officers was before him, to the later report of the British Admiralty, "Possibly slightly damaged," and I think Americans are entitled to have an American Admiral pass upon the actions of American ships rather than to leave it to the British Admiralty, which takes it up afterwards, and makes it "slightly damaged," what Admiral Sims says it was "destroyed."

Then here are the reports upon the U. S. S. *McDougal*, *Conygham*, *Parker*, and *Porter*. I will not stop to read the reports. In the case of the *McDougal*, the report says that it was destroyed. The British Admiralty says "possibly slightly damaged."

In the case of the U. S. S. *Conyngham*, the report is that it was destroyed. The credit by the Admiralty is "possibly slightly damaged."

In the case of the U. S. S. *Parker*, an extract from the war diary of Commander W. Brown says "probably sunk." The credit given by the British Admiralty is "probably seriously damaged."

In the case of the U. S. S. *Porter*, the report was "probably sunk." The credit by the Admiralty was "probably seriously damaged."

In the case of the *Stewart*, the report was that the submarine was destroyed, and the credit given by the Admiralty was "probably seriously damaged."

The credit given by the Admiralty in the case of the *Warrington* was "probably slightly damaged."

In the case of the U. S. S. *Benham*, Admiral Sims says:

The force commander transmits with pleasure to the commanding officer of the U. S. S. *Benham* the original of a letter received by him from the Admiralty concern-

ing the engagement between the *Benham* and an enemy submarine on the 30th of July.

2. In publishing this letter to the officers and crew of the *Benham*, please express to them my admiration and gratification for this example of the excellent organization and spirit existing on board.

The credit given by the Admiralty is "probably seriously damaged."
These reports are as follows:

U. S. S. "McDOUGAL," September 8.

[Extract from Admiral Sims's general report, Sept. 15, 1917.]

U. S. *McDougal*: Successful protection of two meeting convoys against enemy submarine; her possible destruction.

McDougal (Commander A. P. Fairfield) (of *Denver*, six New York convoy) at 1.21 a. m. sighted submarine on surface, bearing 15° on starboard bow. Gave chase at full speed. Submarine submerged 500 yards ahead of this ship. Dropped two depth charges near spot where submarine submerged at an interval of about 5 seconds apart. Circled around spot; then noticed oil slick, but could see nothing further during darkness.

At the time of dropping depth charges, a northward bound convoy was sighted in a position directly ahead of submarine, distant one-half mile. One or more ships of convoy were undoubtedly saved by the fact that the submarine was forced to submerge hastily. Submarine believed to be damaged or sunk; no evidence obtainable. At 11 a. m. large patch of oil on the surface of the water about 1 mile in diameter. No wreckage was seen.

NOTE.—North-bound convoy was from France to Wales, and H. M. S. *Duke of Edinburgh* *McDougal*, in special report, adds: Was guarding left flank of convoy. Submarine when first sighted was about 1 mile, directly in path of moon's rays, on smooth sea. Doubt at first existed as to whether or not she were a patrol boat. To tell was difficult, as craft was end on to the *McDougal*. The chase, with crew at quarters, lasted 2½ minutes before it was proved a submarine. A second later she submerged. Left a swirl in the water which *McDougal* reached in a few seconds and ran through. Both charges functioned properly. The first was dropped as swirl passed under amidships section of ship; second, just as the stern passed clear of swirl. At time of submergence submarine appeared to be heading at a very slight angle to left of *McDougal* course. The helm was used to bring the ship over slightly to the left edge of the swirl, in order to make allowance for dropping charges, full port helm was used to circle and note results. Oil was seen on the surface, but low visibility made it impossible to determine amount. Ship was forced, after two or three circles, to rejoin convoy.

(Credit by Admiralty: "Possibly slightly damaged.")

U. S. S. *CONYNGHAM*, October 19, 1917.

During the afternoon *Conyngham* hailed H. M. S. *Orama* and suggested that due to submarine reported ahead convoy change course. This was not thought advisable by the commanding officer of H. M. S. *Orama* and convoy proceeded on original course.

At 5.30 p. m. *Parker*, in position 48° N. 09-20 W., escort—about 2 miles ahead of convoy, reported sighting discolored water (brownish).

At 5.50 p. m., while *Conyngham* was alongside starboard side of *Orama* passing her recognition signals, a torpedo crossing *Clan Lindsay's* bow, struck H. M. S. *Orama* in port side, about No. 3 hold. A distinct report was heard, followed immediately by cloud of smoke arising from *Orama* forward of her bridge. *Orama* listed to port and began to sink by the bow. *Conyngham* by radio ordered convoy to disperse. *Conyngham* sounded general quarters and went full speed ahead and crossed *Orama's* bow by going full left rudder, then proceeded to make circle between VA and VR columns. When circling a wake was sighted on starboard quarter. A periscope about 1 foot emerged visible for few seconds only was seen in this wake. A short time afterwards a periscope was sighted sharp on our starboard bow. This periscope submerged almost immediately, but wake was plainly visible. *Conyngham*, then a few yards from the periscope, headed for same and dropped depth charge over the wake. An explosion resulted. Large quantities of discolored water was seen to rise in the air and a number of crew and officers distinctly made out a quantity of wreckage, one piece of which might have been the wireless mast of the submarine, when *Conyngham* circled near the spot of the explosion.

(Credit by Admiralty: "Possibly slightly damaged.")

U. S. S. "PARKER"—Commander W. Brown.

[Extract from War diary August 3, 1917.]

On patrol area. At 2.12 took over escort. Steamship *Hobein* and steamship *Civilian*. Course of convoy 106° true, speed 10½ knots. At 8.25 a. m., turned over convoy to U. S. S. *Fanning* and *Perkins* and returned to patrol area. At 12.30 received approximate location of submarine in latitude 52.30 N., longitude 15.10 W. Went full speed, 20 knots, and set course for this position. At 2, having passed through position, began making 10-mile circles with the idea of locating submarine reported. At 2.15 sighted steamer bearing 300°, distance about 10 miles. At the same time received S. O. S. from *Newby Hall* in that position. Went full speed, 25 knots, and on approaching steamer noticed she had a list to port. Fired two shots at extreme range, 13,500 yards, just clear of port side of steamer. On arriving at steamer, found it to be steamship *Newby Hall* and that the submarine had gone down 6 miles NNW. from the *Newby Hall's* then position. Went to this position and steered circles for half an hour, sighting nothing; returned to escort steamer. At 4.10 turned *Newby Hall* over to U. S. S. *Burrows*, and returned to look for submarine. At 4.35 sighted steamer practically in position where submarine was reported. This turned out to be the steamship *Rio Verde*. Took the *Rio Verde* under escort, course 106° true, speed 8½ knots.

At 6.50 p. m., sighted submarine bearing north true. Changed course immediately to north true, and when about 8,000 yards from submarine it submerged. Continued course, and on reaching position noticed a very clearly defined oil slick tending north true. Got in the middle of this and followed it down. Could see the end of the oil slick clearly defined and that it appeared to be moving in the same direction and narrowing. On reaching the end of the slick saw submarine underneath the end of the bridge. Dropped two depth charges on the submarine and from all evidence she was very probably sunk. There was practically simultaneous explosion of the depth charges followed by another explosion. There was discovered on the surface of the water air bubbles, oil bubbles, and a heavy scum of oil and particles of what appeared to be cork. Remained in vicinity for one hour and a half. Sea was smooth, wind light airs, depth of water about 1,200 fathoms. At 8.40 set course 122° true, speed 20 knots. At 11.26 set course for Bull Rock, 107° true, speed 20 knots. Returning to Berehaven in accordance with schedule.

(Credit given by Admiralty: "Probably seriously damaged.")

U. S. S. "PORTER."

At 8.46 p. m., April, 1918, in latitude 49.07 N., longitude 5.53 W., while this vessel was in position as right flank ship on sounding line in company with *Duncan*, *Cummings*, *Conyngham*, *Sterrett*, and *Burrows*, the foretop lookout reported a periscope of a submarine about 1,000 yards on starboard bow heading in a southeasterly direction. Course of this vessel 329° true, wind 3, sea smooth.

We had, about 15 minutes before, passed close ahead of a convoy composed of seven large merchant vessels escorted by several British destroyers, one of which was towing a kite balloon. The submarine was heading for a favorable position to make an attack and was going at a speed estimated to be 9 to 11 knots. Convoy at this time was distant about 3 miles, bearing 90° true and steering in a southeasterly direction.

The officer of the deck turned toward the periscope at full speed and, with the assistance of the lookout, steered the ship toward the submarine. In the meanwhile the commanding officer arrived on the bridge and continued the maneuver commenced by the officer of the deck. The commanding officer steadied the ship on a course directly astern of the submarine, which was still showing its periscope, and we rapidly overhauled it. On arrival at a position about 30 yards from the bow, the periscope disappeared. Continued on course, and on arrival of stern at position about 20 yards ahead of point where periscope was last seen, launched two depth charges from hydraulic release and two from the Thornycroft throwers; immediately afterwards put rudder 20° right and continued pattern in accordance with diagram. Launched altogether 23 depth charges, all of which functioned properly with the exception of the seventh and two or three subsequent ones.

Returned to the spot, but as darkness had set in was unable to see any result. Ship remained in vicinity until 8.30 a. m., April 29, 1918. At daylight a large number of dead fish were seen with a great deal of small driftwood and a considerable quantity of oil. Owing to fresh northeasterly breeze it was difficult to note the nature of the oil. A small shallow box of 2-inch pine, about 1½ feet square, and painted slate color, was picked up.

The commanding officer desires to invite the attention of the force commander (usnfoiew) to the action of the following officers and men:

J. Meetish, seaman, United States Navy, for his exceptional alertness as lookout in sighting a periscope under adverse conditions of light and for efficiency in conning the ship toward the periscope.

Lieut. R. B. Twining, United States Navy, for his prompt action in heading for submarine. Lieut. O. C. Badger, United States Navy, for his coolness and good judgment in directing the launching of the depth charges.

H. Fritchett, chief gunner's mate, United States Navy, for the efficient manner in which he responded to the directions for dropping the depth charges.

B. O. Frank, chief machinist's mate, United States Navy, for the prompt manner in which the engine room answered the emergency call.

H. Henkle, water tender, United States Navy, for the prompt manner in which the fire room answered the emergency call.

W. H. LEE.

(Credit given by Admiralty: "Probably seriously damaged.")

U. S. S. "STEWART," April 24, 1918.

From: Commanding officer.

To: Commander, United States naval forces in France. (Via chief of escort, group "C")

Subject: Attack on submarine.

1. At 11.50 a. m. (summer time) on April 23, 1918, when off Penmarch escorting the southbound convoy, Brest-Quiberon, two hydravions were seen to be dropping bombs about 2 miles to seaward of our position. Stewart immediately proceeded toward them at full speed and a French destroyer was seen coming from the northward and heading for the same spot.

2. One hydravion came directly toward Stewart, dropped a bipu and the observer gave the direction of the submarine by pointing. A clear and distinct wake was then picked up, and at the end of this wake an object could be seen just breaking the surface. We ran down this wake, heading directly for the disturbance in the water. The wake led to seaward, but the broaching object turned off to the right and just before Stewart reached the spot was at right angles to the original wake. One of the hydravions dropped a smoke bomb very close to this spot.

3. Sea was smooth with a light swell and conditions perfect for tracking a submarine. Just before Stewart reached the spot, the broaching ceased, but, silhouetted in a swell, I saw a large, dark object in the water underneath the disturbed surface.

4. The French destroyer, approaching at right angles, crossed the submarine wake just ahead of Stewart, forcing me to sheer off to starboard slightly, but he did not drop any depth charges; possibly he was attempting to ram. Stewart passed within 50 feet of the dark object and disturbed water, dropping two charges in close succession. The water brought up by both these bombs was very dark and heavy oil spread on the surface from this spot. Three other bombs were dropped which brought up clear water; one on the approach and two while circling after passing submarine. One of these was slow in detonating.

5. These bombs were dropped so close to the submarine, one on each side and within 50 feet of it and the force of explosion was so great that it seems impossible that the submarine could have survived. Depth setting was 80 feet, depth of water about 40 fathoms. It was also observed that the columns of water which brought up oil were more spread out and not so high as the columns of clear water. For a time after the explosion the water in the vicinity was streaked with a thick reddish substance the nature of which could not be determined. The oil was unmistakable and spread over a large area. The submarine could hardly have been more than 50 feet under the surface when the charges exploded as he was very close to the surface when we were within 150 yards of him, making about 21 knots.

6. Stewart remained near the spot until 4 p. m., then proceeded at full speed to rejoin convoy in accordance with orders from chief escort. At this time several French patrols had arrived and were patrolling in the vicinity. Oil was still coming to the surface, but in no definite bubbles. An anchor buoy was dropped in latitude 47° 50' north, longitude 4° 32' west, and it is thought that by dragging, the submarine can be located and its destruction definitely proved.

7. This action is considered an excellent example of the efficiency and coordination that can be obtained when avions and destroyers are working together. The work of the avion in directing the Stewart was so perfect that not a second was lost in reaching the submarine's exact position.

H. S. HAISLIP.

[First indorsement.]

U. S. S. "WANDFRED," April 27, 1918.

From: Chief of escort, group C.

To: Commander United States naval forces in France.

Via: District commander United States naval forces in France.

1. Forwarded.

2. The quick realization of the situation and prompt action of the *Stewart* enabled her to meet the submarine before he had submerged sufficiently to lose trace of him. This prompt action undoubtedly was the cause of the good results obtained, and saved our convoy of 17 ships from most certain attack.

P. S. WILSON.

[Third indorsement.]

APRIL 28, 1918.

From: Commander United States naval forces in France.

To: Force commander.

Subject: U. S. S. *Stewart*: Action against German submarine.

Reference: My cable No. 2027 of April 28.

1. Forwarded. This was previously reported in reference.

2. There is no doubt that the action of the avions and of the *Stewart* prevented an attack on the convoy by this submarine. It is also considered probable that the submarine was destroyed by the *Stewart*, although there is no conclusive evidence of this.

H. B. WILSON.

(Credit given by Admiralty: "Probably seriously damaged.")

U. S. S. "WARRINGTON," July 17, 1917.

From: Commanding officer.

To: Commander in chief, coast of Ireland station.

Subject: Report of operations, July 13, 1917.

1. At 1.18 p. m., July 13, 1917, while in position latitude 51:20 north, longitude 8:52 west, on course 118° true, speed 15 knots, sighted submarine on surface on port beam about 4 miles distant; conning tower was plainly visible, and when on the crest of a wave the bow would show well out of water.

2. Turned and headed full speed for submarine, and when about 2½ miles distant she submerged. On arrival at estimated position of submarine found an elliptical-shaped oil slick about 150 yards, with a narrow oil slick leading off to southward. This small slick seemed to be in process of formation and seemed to indicate something underway beneath the surface. Also bubbles were visible.

Dropped a depth charge at end of slick. Charge exploded and the water was discolored over an area of about 50 yards square. Also oil seemed to appear over the surface.

Searched area within 7-mile radius for about two hours. Nothing more was seen. When submarine was first sighted sea was smooth and weather slightly hazy, radius of visibility about six miles. Within one-half hour the haze had disappeared and visibility conditions were extremely good.

3. At 9.03 while in position lat. 51.29 N; long. 8.15 N., course 58 true, speed 15 knots, sighted a very large oil slick about 1½ miles long and 100 yards wide. Investigated this slick and when about 50 yards from windward of slick (where oil was thickest and seemed to originate) the ship struck a submerged object. This was not felt on the bridge, but all the men in the after living compartments were awakened and rushed on deck. They reported that the blow was very pronounced and felt as though the after end of the ship were being lifted. Immediately turned and ran over the spot again and dropped a depth charge. This charge did not explode. Made another circle and dropped a charge over the origin of the oil. This time the charge exploded. On returning to the spot found that oil was spread over the surface, for about 200 yards square and there was a very strong odor of fuel oil. Searched the neighborhood for about one-half hour (until it was quite dark) but did not discover anything.

Weather conditions—sea smooth; light breeze from southwest, clear.

I. F. DORTCH.

(Credit given by Admiralty: "Possibly slightly damaged.")

U. S. S. "BENHAM," July 30, 1917.

En route to Queenstown, Ireland.

At 7.10 a. m. sighted wake of periscope of enemy submarine three points forward of port beam, distant 1,500 yards. Went to general quarters and turned toward submarine

at full speed. Opened fire from forecandle gun at 7.11. Passed over wake and let go depth charge, then turned with full right rudder and let go second depth charge. Submarine changed course to southeast. Turned with full right rudder, ran down wake and let go third depth charge. Turned with full left rudder, opened with port battery. Ran down wake. Ceased gunfire. Let go fourth depth charge directly over submarine at 7.32. Turned with full right rudder. No evidence of wake or periscope. Bubbles were seen rising, and large oil slick. At 7.45 resumed course and speed. Secured from general quarters at 7.55. Ammunition expended, 26 rounds 4-inch and four depth charges. Position of action, latitude 49° 32' north, longitude 6° 34' west.

SEPTEMBER 6, 1917.

From: Force commander.

To: Commanding officer, U. S. S. *Benham* via commanding officer, U. S. S. *Melville*.

Subject: Admiralty's commendation of action between U. S. S. *Benham* and enemy submarine on September 30, 1917.

Inclosures: (1) Original of Admiralty's letter of August 21, 1917, in part.

1. The force commander transmits with pleasure to the commanding officer of the U. S. S. *Benham*, the original of a letter received by him from the admiralty concerning the engagement between the *Benham* and an enemy submarine on July 30.

2. In publishing this letter to the officers and crew of the *Benham*, please express to them my admiration and gratification for this example of the excellent organization and spirit existing on board.

WM. S. SIMS.

AUGUST 21, 1917.

DEAR ADMIRAL SIMS: The Admiralty has received a report of an engagement between the U. S. S. *Benham* and an enemy submarine on July 30, 1917, and desire me to express to you their lordship's admiration of the decision and ability shown by the commanding officer and crew of the *Benham*.

I am, yours, very truly,

A. A. R. MURRY.

(Credit by Admiralty: "Probably seriously damaged.").

U. S. S. *Patterson*, *Beale*, *Burrows*, *Allen*.

(Report of commanding officer, U. S. S. *Allen*.)

At 4.08 p. m., May 19, 1918, while the U. S. S. *Allen* was in latitude 52° 46', longitude 5° 30' west on patrol duty, in the Irish Sea, the following radio was received from U. S. S. *Patterson*:

"Dirigible Z-51 reported periscope sighted beneath surface. She dropped one depth charge. U. S. S. *Patterson* dropped pattern on 10 depth charges latitude 52° 47' north, longitude 50° 04' west. No apparent results."

A dirigible being in sight it assured this was the one, and in accordance with doctrine, immediately headed for position at full speed.

At 4.21 p. m., received following radio from U. S. S. *Patterson*:

"Believe submarine in damaged condition. Only have two depth charges. Request your cooperation. Ten miles west of Bardsey."

Immediately sent radio "Make some. Am coming." Within a very few minutes made out U. S. S. *Patterson*'s smoke and altered course slightly and closed rapidly.

Upon arriving on scene found U. S. S. *Patterson*, H. M. S. *P-62*, and two dirigibles. Just as we arrived H. M. S. *P-62* dropped a number of depth charges on a large oil slick.

Signal was received from the *Patterson* that the oil slick seemed to be moving 210° magnetic. Found large oil slick over a mile in length gradually carrying toward 210 magnetic. Proceeded through slick and upon reaching the end of it dropped five depth charges at intervals of 10 seconds. Put rudder 20 degrees right after the second charge. No more depth charges were dropped after swinging right, as there seemed to be no indication or probability of the submarine turning; it appeared almost certain that the charges must have exploded in close vicinity of any submarine that might be beneath the surface. All depth charges were at 105 feet, depth of water 40 fathoms. The ship was immediately swung through 350 degrees and again came down the oil slick, dropping five more depth charges set at 150 feet at intervals of 10 seconds. Put rudder 20 degrees left after dropping the third charge. Again circled and came back slowly over the area covered the depth charges; saw considerable oil and large oil bubbles and smaller air bubbles continually rising to the surface. One of the dirigibles at this moment swooped to the surface of the water near point where the depth charges had just been exploded and signalled that bubbles were

rising. Backed clear, first dropping marker buoy on spot where bubbles seemed to be thickest. Went full speed and approaching marker buoy; allowing for strength of tide, dropped four depth charges at intervals of about seven seconds across the patch where bubbles appeared to be thickest.

On looking back as depth charges exploded, after second charge a white object about 12 inches round appeared on the surface protruding several inches. Ship was circled and brought to vicinity of this object and stopped. The object appeared to be a canvas muzzle bag and painted white and was fresh and clean, about 12 inches in diameter, 20 inches long, with two wrappings of marline and appeared to be exuding thick oil. Immediately alongside of this was a small piece of wood painted white. In attempting to pick up this white object with a boat hook it capsized and a circular piece of wood and considerable oil came out of it, but the canvas sunk. The two pieces of wood were picked up. From all indications the white canvas appeared to be a muzzle bag. Large number of oil bubbles were arising. The wherry was lowered and samples of the oil obtained. The wherry pulled around through considerable of the oil and the oil slick and reported bubbles arising more thickly in the spot some hundred yards farther on. The wherry was accordingly hoisted in and three depth charges were dropped in the center of this other spot. In the meantime the *Beale*, *Burrows*, H. M. S. *Griffin*, *Zephyr*, *Kestrel*, and an unknown yacht and trawler had arrived. U. S. S. *Allen* had but two depth charges remaining, and the *Burrows* was signaled to follow in the wake of the *Allen* and drop 10 charges after we had dropped three before mentioned. This was done.

In the meantime the *Beale* had also located a spot where considerable oil bubbles appeared to be rising and so bombed this spot. *P-62* and one of H. M. S. destroyers had in the meantime bombed other spots which were located by oil bubbles arising. Area covered by the oil slicks was by this time quite large. The *Allen* steamed about slowly through the other oil patch trying to locate any spot which would give greater indications of the presence of a submarine. It was now getting towards dusk. Received orders from H. M. S. *Patrol* to take charge, and accordingly issued orders to the various ships present to cover different sectors during the night, *Allen* in the meantime marking the spot by an anchored lighted calcium buoy.

It is considered that the submarine located by the dirigible *Z-51* and attacked by the *Patterson* was as a result of the *Patterson's* and the combined attack of the various British and United States vessels most probably entirely destroyed or seriously damaged.

It is impracticable to make a sketch of the operations due to the area covered and the number of vessels taking part.

It was a good example of cooperation of not only between surface craft, but between surface craft and air craft. (Credit given by Admiralty: "Possibly slightly damaged.")

U. S. S. *Wakiva*, *Noma*, and *Kanawha*.

United States naval forces operating in European waters, patrol squadron based on French coast.

U. S. S. "PANTHER," FLAGSHIP, BASE 7,
December 3, 1917.

From: Commander patrol force.

To: Force commander.

Subject: Submarine, destruction of, by vessels of patrol force escorting *Kohn* and *Medina*, latitude 47° 23' north, longitude 03° 39' west, November 28, 1917.

1. There are forwarded herewith reports from the commanding officers of the U. S. S. *Kanawha*, U. S. S. *Noma*, and U. S. S. *Wakiva* relative to an action with an enemy submarine on the evening of November 28, 1917.

2. A thorough inquiry has been made into the circumstances attending this action, which together with the reports of commanding officers attached has convinced me:

(a) That an enemy submarine was destroyed by the *Wakiva*.

(b) That there was a strong probability that two submarines were present, and that one of them escaped, and at 3.48 a. m. the following morning and torpedoed the S. S. *Texas* in latitude 47° 35' north and longitude 03° 16' west.

(c) That the same submarine or one of these submarines at 5.50 p. m. November 28 had torpedoed and sunk the steamer *Jean Conseil* in latitude 47° 27' north, longitude 03° 58' west.

3. The escort and convoy sailed from Quiberon the afternoon of November 28, 1917, the time of sailing, formation and zigzag in accordance with doctrine. The *Kanawha*, commanding officer of the escort lead ahead of the interval between *Kohn* and *Medina*; *Noma* on right flank, *Wakiva* left flank.

4. At 6.20 p. m. the lookout on the *Kanawha* reported a periscope on the port beam of the *Kanawha* very close aboard and heading towards the *Medina*. The *Kanawha* made the necessary signals, went full speed, turned with left rudder in the direction the submarine had been proceeding. The submarine submerged and search by all three vessels of escort failed to relocate him. The *Kanawha* made signal to reform convoy and proceed with convoy, leaving *Noma* and *Wakiva* to continue to search. At 6.40 *Noma* and *Wakiva* were directed to rejoin the convoy.

5. The courses of *Noma* and *Wakiva* diverged due to their having positions about 3,000 yards apart in the convoy formation and at 6.50 p. m. the *Noma* sighted a periscope on her starboard beam apparently standing to the northward and eastward (away from convoy).

6. The *Noma* made signal and swung with right rudder at the same time letting go depth charges, but it is believed without injuring the submarine. The *Wakiva* swung with right rudder until she was on leading away from convoy.

7. At 7.02 p. m. the *Wakiva* sighted a periscope on the port bow at a distance estimated to be within 100 yards. The submarine drew rapidly aft and was apparently standing towards the convoy. It then appeared to swing so as to bring a bow tube to bear on the *Wakiva* which turned with left rudder which resulted in the submarine crossing the *Wakiva's* wake. The *Wakiva* fired three shots from its port aftergun, and the third one detonated, apparently striking the periscope, which disappeared. The *Wakiva* also let go two depth charges, one British type D and one French, both of which functioned.

8. The *Wakiva* then swung with hard right rudder and passed near this spot. As she approached, what appeared to be the conning tower of the submarine emerged and the starboard forward gun fired twice the second shot detonating. The conning tower sank, and as the *Wakiva* passed over the spot, a large number of air bubbles were seen coming to the surface of the water, on which there was a large quantity of wreckage which the *Wakiva* did not obtain. As she passed over, two Sperry and one French depth charges were let go, all of which functioned.

9. The *Wakiva* again turned and passed near the spot and her commanding officer thought he saw the shapes of three men clinging to a piece of wreckage and hailed them, but received no response. On passing near the place a fourth time they had disappeared.

10. In the meantime the *Noma* had continued search and at 7.12 p. m. sighted a periscope on her starboard bow; turned toward it and, on passing over the place it had been seen, let go depth charges, but no evidence was obtained as to the effect on the submarine except some oil.

11. Following this action both vessels rejoined the convoy, which proceeded without further incident.

12. The commander patrol force bases his belief that there were two submarines on the fact that the submarine sighted by the *Noma* at 6.50 p. m. was apparently standing away from the convoy while the one sighted by the *Wakiva* 12 minutes later was somewhat to the south and standing toward the convoy; that the *Noma* reports sighting a periscope at 7.20 p. m., or about 18 minutes after it is believed a submarine was destroyed by the *Wakiva*, and on the fact that a submarine was operating about 25 miles to the eastward off Quiberon Bay. Furthermore, about 8.45 p. m. (after the action) the radio operator on the *Noma* heard a vessel sending in German code with low power and apparently very close. This vessel called three times and without waiting for a reply to his call sent the same message each time.

13. There is no question but that the prompt action of all vessels of the escort saved the convoy, and while there is no material evidence to that effect, the commander patrol force is strongly of the belief that a submarine was destroyed by the *Wakiva*.

14. Attention is also invited to the report of the commanding officer upon the excellent manner in which the master of the *Koln* acted in the emergency.

15. Moonlight, but sky overcast, with smooth sea during action.

REPORT FROM COMMANDER OF U. S. S. "WAKIVA."

NOVEMBER 28, 1917.

At 6.50 p. m., an alarm was given by the U. S. S. *Noma* followed immediately by a depth charge. The *Wakiva* turned to the right and headed toward the *Noma* at full speed, the crew being at quarters. At 7.02 p. m., while about $1\frac{1}{2}$ miles from the *Noma*, a periscope was sighted on the port bow, 100 yards distant. The submarine was going in the opposite direction to that of the ship, evidently intending to use a bow tube, if possible. The *Wakiva* was put hard left to avoid this maneuver and the submarine headed toward the *Wakiva's* wake. Fire was immediately opened with

No. 4 gun, and the third shell struck the periscope and was detonated, probably blowing off the end of the periscope, for it was no longer seen. Before this shot with No. 4 gun, it was seen that the periscope was heading to pass astern of the *Wakiva*.

Accordingly two depth charges were dropped over the quarter at 7.04 p. m., one being an English depth charge and the other a French depth charge. Both depth charges functioned, and it was estimated that they exploded at about 70 feet, causing a great commotion in the water, and evidently badly damaging the submarine, which was seen to break water at a point directly over where the charges were exploded. The *Wakiva* was immediately put hard right, and passed again over the same spot, above which some wreckage, considerable oil, and air was seen. On passing over this spot the second time two Sperry depth charges and one French depth charge was dropped at about 7.19 p. m. All these charges functioned and the oil, air, and wreckage continued to come to the surface.

At this time No. 1 gun opened fire on the wreckage and fired two shots, both of which were hits, one of which exploded.

The *Wakiva* was again put hard right, and passed the wreckage on the port hand. It was thought that there were three men clinging to the wreckage, but when the *Wakiva* turned for the fourth time and approached the wreckage, they had disappeared.

At 7.35 p. m. the *Wakiva* headed for its position with the convoy, which had proceeded escorted by the U. S. S. *Kanawha*, and rejoined the convoy at 8.45 p. m.

This engagement took place in latitude 47° 23' north, longitude 03° 39' west.

During the engagement an all message was sent to the commander United States naval forces at Brest, France, giving location of this submarine.

While the *Wakiva* was engaged with this submarine the *Noma*, about 1½ miles distance, was dropping depth charges on another submarine, and the conclusion reached would seem to be that there were two hostile submarines waiting south of the Ile De Groix intending to attack the convoy. The first of these was sighted by the U. S. S. *Kanawha* and driven away, probably submerging and waiting until the search had been given up. The submarine sighted by the U. S. S. *Noma* and pursued was probably either the one sighted by the *Kanawha* or the mate of that submarine. All conditions point to the supposition that there were two submarines in this vicinity, for while the engagement was going on between the *Wakiva* and the submarine the *Noma* was having a similar engagement about 1½ to 2 miles distance in a northerly direction toward the Ile De Groix.

While it was not possible to bring in any material evidence to aid in the proof of the sinking of this submarine by the U. S. S. *Wakiva*, it is believed that this submarine was sunk and that all on board were lost.

During the night in question there was a moon partially obscured by clouds, but the periscope was distinctly seen by nearly all officers and gun crews, and after the first depth charge the water was broken immediately over the place where the charge exploded by what was thought to be the conning tower of the submarine and which slowly disappeared. Over this spot there were seen great quantities of oil, some wreckage, and several geysers of air, while a strong odor of petroleum and oil was very evident. It was believed that three men were seen clinging to the wreckage, but before the vessel could turn and again approach the post the men had disappeared.

Throughout the entire engagement the crew worked as a perfect fighting unit. They showed admirable coolness and courage, and in no instance was any nervousness or inefficiency manifested.

The armament functioned perfectly in every respect. There were no missfires, hangfires, or faulty ammunition. All depth charges functioned perfectly and evidently exploded at their set depths.

(Credit given by Admiralty: "Probably seriously damaged.")

The CHAIRMAN. Mr. Secretary, have you been able to get any information from the German records that shows anything positively in regard to these matters?

Secretary DANIELS. There is a publication which I have, a review of in a magazine. I can not remember the name of the officer who wrote it. He has written a book about it, which is reviewed in this magazine which I have. I have telegraphed to obtain the book, which I hope to have. I have been unable to get it at Brentano's and other places here. In this book he discusses very fully Von Tirpitz's and Von Capelle's statements and opinions.

The CHAIRMAN. But he does not go specifically into it in his book? Secretary DANIELS. I have not seen it as yet, Mr. Chairman, and I can not say.

I have put these reports in the record, because most of them indicate that the submarines were destroyed, whereas they got from the British Admiralty only "possibly damaged," or something like that.

PRISONERS OR WRECKAGE NOT ALWAYS REQUIRED.

In explaining why so few credits were given for known sinkings, most of these credited as successful being listed merely as "Probably slightly damaged," the summary compiled by Admiral Sims's headquarters states that "unless prisoners or unmistakable wreckage was obtained following an attack, it was practically impossible to definitely determine the results of the attack."

That prisoners or wreckage were not absolutely required before a vessel was credited with sinking a submarine is shown by the following reports, taken from the British Admiralty records, of cases which were classed as known sunk:

Known: U 69; July 12; 60° 23' north, 1° 32' east. (North Sea N.) 271.

The first section grand fleet kite balloon destroyers were spread on patrol lines 15 miles apart. At 0537 a submarine was sighted by *Patriot* on the surface 28 miles east. *Patriot* shaped course for same at 25 knots. Submarine dived when 6 miles off at 0615. At 0705 submarine came to surface about 4 miles off. *Patriot* opened fire and submarine dived. *Patriot* proceeded to spot and dropped two depth charges (type B). At 11.25 a. m. a heavy explosion was heard and shock was felt. There was no ship in sight.

Twenty minutes later *Auzac* found what was evidently the scene of the explosion in 60° 25' north, 1° 32' east. The sea was covered for about 400 yards with thick, brown fuel oil in a turbulent condition, still rising. At 1620 oil was still rising and had spread over an area 4 to 5 miles long by 1 mile wide. Twenty-four hours later it stretched for a mile wide, up and down wind, as far as the eye could reach. (M. 09278).

Known: UB. 107; 50° 24' north, 0° 24' west. (North Sea.) July 27. 244.

At 2030, while on hydrophone patrol in neighborhood of convoys, H. M. trawler *Calvia* sighted submarine about 500 yards on starboard bow, both periscopes and outer rail of conning tower being just awash. Trawler's helm was put hard aport, but submarine dived immediately, leaving a large swirl on surface. A strong flood tide was running and *Calvia* proceeded about 100 yards to northward of swirl and dropped a depth charge. A combined attack with depth charges by trawlers *Calvia*, Commander Nasmith and *Walter Priory*, and H. M. T. B. D. *Vanessa* then followed. Submarine was heard on hydrophone quite loud close to *Calvia*, and *Vanessa* dropped depth charges all round the position, after which nothing more was heard.

At 2215 *Calvia* observed a patch of oil and bubbles in the vicinity, and *Vanessa* dropped a depth charge to north and east of it.

At 0630 on 28th what appeared to be a headless body was observed floating by, partially submerged. Engines were put full astern, but the body must have got mixed in the swirl as nothing more was seen. (M. 022637, 022393.)

Known. U. B. 90; October 16; 57° 55' north, 10° 27' east. (North Sea.) 250.

At 1613 H. M. submarine *L 12* on patrol, steering south, sighted what looked like the conning tower of a submarine bearing 30° on the starboard bow. The light was beginning to fail and course of submarine could not be made out, so speed was increased to full till 1622 to close. The conning tower was then observed on same bearing about 1½ miles distant, and submarine was seen to be steering straight for *L 12*, who therefore altered course to southeast and proceeded full speed to open.

When next observed at 1628 enemy was on port quarters, having apparently altered course 90° to starboard, so *L 12* turned to port under full helm and steadied on 30°.

At 1632 range was about 1,500 yards and enemy's speed about 12 knots. Light was now becoming very bad, but it appeared that *L 12* was on enemy's beam, so four 21-inch bow torpedoes were fired in pairs with 10 seconds interval between, one torpedo of each pair being angled to 3°, deflection 20°. One minute 25 seconds after the first

torpedoes were fired a loud explosion was heard, and 30 seconds later no submarine was visible through the periscope.

On arriving at the spot the surface of the water for a radius of 200 yards was covered with oil and there was a very strong smell of paraffin. Several small pieces of wreckage were observed and a black shape resembling a human body, but these could not be picked up and were eventually lost sight of in the darkness. (M. 024719.)

Known. U. 84; January 26; 51° 53' 30" north, 05° 44' west. (Irish Channel Approach.) 19.

At 0610 H. M. S. *P 62* was on patrol between the Smalls and Tuskar Lighthouses, steaming northwest at 12 knots and zigzagging. A dark object was sighted off the port-bow, distant 300 yards, and steering in an opposite direction. Course was at once altered to port, and object was seen to be a very large enemy submarine on the surface. Submarine endeavored to keep clear by altering course to starboard and then endeavoring to dive. *P 62* went full speed ahead and rammed the enemy at right angles just abaft the conning tower. She was traveling at 17 knots at the moment of impact, and the collision brought her up standing.

Half the conning tower of the submarine was visible, and, when struck, the stern appeared above the surface.

Large quantities of oil were seen on the surface when day broke, and a "D" type depth charge, set at 200 feet, was dropped over the position, but no wreckage appeared. (M. 01573.)

BRITISH ADMIRAL AND ITALIAN GENERAL STAFF SAID UNITED STATES SUB. CHASERS SANK SUBMARINES AT DURAZZO.

I wish to call special attention to what I am going to read now, because I think it is of the highest importance, and shows Admiral Sims's great mistake and great wrong of permitting the admiralty of another nation to withhold credit from American commanders who sank submarines.

Though the British force commander in the Adriatic cabled that our submarine chasers in the attack on Durazzo, the Austrian naval base, October 2, 1918, "apparently destroyed definitely one submarine which torpedoed H. M. S. *Wemouih* and damaged and probably destroyed another submarine"; and the Italian naval general staff expressed to Admiral Sims its "admiration of their brilliant and clever operations which resulted in sinking two enemy submarines," this seems to be omitted from the list of successful attacks compiled by Admiral Sims's headquarters, which does not mention any credit having been given them by the Admiralty.

The dispatch sent through the British Admiralty to Admiral Sims by the commander of the British Adriatic force was as follows:

I am most grateful for the valuable service rendered by 12 submarine chasers under Capt. Nelson, United States Navy, and Lieut. Commander Bastedo, United States Navy, which I took the liberty of employing in an operation against Durazzo on October 2. They screened heavy ships during the bombardments under enemy fire; also apparently destroyed definitely one submarine which torpedoed H. M. S. *Weymouth*, and damaged and probably destroyed another submarine. During the return voyage they assisted in screening H. M. S. *Weymouth*, and in escorting enemy hospital ship which was being brought in for examination. Their conduct throughout was beyond praise. They all returned safely without casualties. They thoroughly enjoyed themselves.

Admiral Sims also received the following dispatch from Rome:

Italian naval general staff expresses highest appreciation of useful and efficient work performed by United States chasers in protecting major naval vessels during action against Durazzo; also vivid admiration of their brilliant and clever operations which resulted in sinking two enemy submarines.

Now, Mr. Chairman, if the admiralties of other nations are to determine the credit due to American commanders for sinking enemy

submarines, instead of American admirals, I submit that we ought not to confer that power upon the British Admiralty when an engagement takes place in the Adriatic, but we ought to accept the decision of the Italian general staff rather than that of the British Admiralty.

"TWO SUBMARINES OUT OF THREE DESTROYED," CAPT. NELSON REPORTED.

Capt. Charles P. Nelson, commanding the 11 United States submarine chasers which took part in the attack on Durazzo, said in his report:

I wish especially to commend the efficient manner in which the chasers of unit B, under direct command of Lieut. Commander Paul H. Bastedo, United States Navy, accomplished their mission. I want to especially mention the fact that two submarines out of three were destroyed by this unit.

Now, there is a direct statement by Capt. Charles P. Nelson, one of our best naval officers, that unit B, under the command of Lieut. Commander Bastedo, destroyed two out of three.

When I was in London last year on every hand I was told that Commander Bastedo and Capt. Nelson had rendered a service that gave great glory to the Navy, and that Bastedo's unit of chasers had sunk two submarines. It was generally accepted by the people who told me about it. And yet they have no credit. [Continuing reading:]

I want to especially mention the fact that two submarines out of three were destroyed by this unit, one of them by two chasers of the unit and the second by one which had broken down and acting by himself. The manner in which these attacks were conducted was highly satisfactory, and had another unit been operating in company with unit B, I feel certain that the third submarine would also have been accounted for. A careful study of the manner in delivering the attacks in both cases shows quick judgment and equally accurate execution, which resulted in probably avoiding further damage to the main body.

The manner in which the sub chaser 129, acting singly and in a crippled condition, completed her successful attack I consider as worthy of special mention as showing excellent judgment and prompt action.

ATTACK OF SUB CHASERS 215 AND 128.

The following account is given of the attack of sub chasers 215 and 128 on enemy submarines:

Unit B, sub chaser 215, sub chaser 128, and sub chaser 129, were steaming in column in a general northeasterly direction to take station on assigned patrol line when at 10.28, sub chaser 129, the rear ship, was seen to sheer off to port. Sub chaser 215 turned to port, as it was decided that subchaser 129 had sighted a submarine and was attacking. At this moment sub chaser 215 sighted a moving feather about one and one-half points forward of port beam, distant about several hundred and fifty yards and heading to the northeastward.

At 10.30 the sub. chaser 215 opened fire with her 3-inch gun and port machine gun, changing course to port toward the submarine and hoisting signal to form for attack. The second 3-inch shot was fired on the starboard bow and was seen by the commanding officer and executive officer to drop 2 feet short of the then visible periscope, shattering it, as a column of air and water was seen to rise to a height of about 6 feet. The next two shots were aimed at this air and water column. This column resembled that given off from Italian submarine *Nautilus* when the latter was fouled and her periscope was broken off by the sub. chaser 128 at Gallipoli. Six 3-inch shells were fired.

Sub. chaser 215 kept turning to port, and sub. chaser 128, which had been following, maneuvered to take position on starboard beam, distant 100 yards. About the time

of the second shot it was seen that the submarine was turning sharply to starboard in a general southerly direction toward the British light cruisers, which at the time were at a distance of about 2 miles, and headed to the southward to enter their bombarding sector.

Sub. chaser 215 and sub. chaser 128 closed the submarine, and laid a pattern of depth charges in position approximately latitude 41.23 north, longitude 19.14 east, in about 40 fathoms of water. Sub. chaser 215 dropped six depth charges from her stern and fired Y-gun charges. All charges were set at 50 feet and functioned properly.

The first four charges let go from the sub. chaser 215 showed only the usual depth-charge disturbance. In the explosion of the starboard Y-gun charge, the executive officer of the sub. chaser 215, who was on top of the pilot house, saw an object which resembled a plate, also some débris, rise to the surface and then disappear, and he sang out something to the effect, "that got him." This object and débris were seen by several men on deck; also, a man in the engine room looked out of the port and seeing something similar sang out that a ship had been torpedoed close aboard. At the explosion of the fourth depth charge, dropped from the sub. chaser 128, the two machinist's mates, who were dropping the charges reported that they saw a piece of wreckage rise and then sink. Heavy dark oil in large globules was seen rising.

After bombing sub. chaser 215 and sub. chaser 128 turned to head for sub. chaser 129, which latter vessel had previously reported a submarine and was at this time lying to with her engines disabled. At the moment it was felt that a successful attack had been delivered and it was considered more important to hunt other submarines to the southward than to search carefully the area just bombed. Sub. chaser 215 and sub. chaser 128 immediately stood for sub. chaser 129 at full speed. I firmly believe that the charges dropped at point A by the sub. chaser 215, together with the fourth charge dropped from the stern of the sub. chaser 128 destroyed the submarine.

ATTACK OF SUB. CHASER 129.

The following account is given of the attack of sub. chaser 129 on enemy submarine:

About 10.25 United States submarine chaser No. 129, the rear ship of unit B, then steering a northeasterly course to take position on assigned patrol line, sighted a moving feather on her port quarter, distant about 1,600 yards. The feather was moving in a southerly direction and was seen by the executive officer and by members of the crew. A signal was sent immediately to the sub. chaser 215, reporting a submarine sighted, and course was altered slowly to the left so as to deliver an attack at right angles. The speed of the submarine was estimated to be about 6 knots. He was headed in a general southerly direction, apparently getting into position to attack the bombarding forces. About the same time a second periscope feather was sighted a little farther to the westward.

At 10.34 a stern bomb was dropped due to the whistle having been accidentally blown. After this explosion the submarine submerged for almost a minute and he then reappeared, showing both periscopes. At 10.36 sub. chaser No. 129 commenced laying a pattern of depth charges ahead of the submarine and at right angles to his course. All charges were set at 50 feet except No. 8, which was set at 150 feet. After bomb No. 2 was dropped the periscope was still plainly visible but disappearing. No. 3 bomb was dropped just before reaching his wake and it seemed that the course being steered by 129 would bring the fourth bomb directly over the submarine. After bomb No. 5 was dropped it was necessary to slow to 5 knots on account of engine trouble. In the water thrown up by bomb No. 7 objects resembling pieces of metal appeared. What seemed to be an explosion other than the depth bomb was noted about this time.

The chaser, after delivering her attack, steamed back toward the bombed area and found thick brown oil spreading and numerous bubbles rising. The vessel was stopped. At 10.40 a circle of white, bubbly water suddenly rose to the surface about 25 yards distance on the starboard beam. This boiling patch lasted for about 20 seconds and then subsided. After this, bubbles continued to rise. I firmly believe that the submarine was destroyed.

ARMED GUARDS HAD MANY ENCOUNTERS WITH SUBMARINES.

Though our armed guards on merchant vessels had more encounters with submarines than had any other branch of the service, the Sims headquarters list makes no mention of any credit whatever being

given them for sinking or damaging submarines. Even though Admiral Sims did assert repeatedly that the arming of merchantmen was practically valueless as a protection against submarines, he can hardly carry his prejudice so far as to deny to the thousands of our armed guards credit for their courage, efficiency, and success in repelling submarine attacks.

The records of the armed-guard section show that 384 merchant ships were armed by the United States Navy, and these vessels made 1,832 trans-Atlantic trips: 347 sightings of or attacks by enemy submarines were reported: 227 attacks by enemy submarines were classified as "actual;" 193 attacks were successfully repulsed; 44 of the encounters reported were surface encounters, some of them being long-continued gun-fire engagements, two of them being of no less than four hours' duration.

The reports indicated that in 34 of these attacks the submarine was damaged, and in several instances there was strong evidence that the submarine was sunk. A few extracts from the hundreds of armed-guard reports are given below:

STEAMSHIP "SILVER SHELL," MAY 30, 1917.

Engagement of the steamship *Silver Shell* on May 30, 1917, latitude 39° 22' north, longitude 5° 24' east, off the Balearic Islands. William J. Clark, of New York, chief turret captain, who was in command of the armed guard, reported:

May 30, at 5.35 p. m., a submarine was sighted off starboard beam, flying no flag or marks of identification. Manned and loaded both guns. Hoisted colors and waited about 10 minutes. Fired after gun with sights set at 4,000 yards, scale 49, and fired purposely short to see what the submarine would do, as she was closing in on the *Silver Shell*. At the same instant of our flash the submarine fired a shot, the shell dropping 100 yards short amidships. The ship was swung to port to bring the submarine astern.

Twenty-five rounds were fired at the submarine, the last two of which appeared to be hits. As the last shot landed the submarine's bow raised up and went down suddenly. The crew of the submarine who were on deck did not have time to get inside, so it is believed there is not much doubt about her being hit.

The submarine fired in all 32 rounds, the last four of which were shrapnel and exploded overhead. The second shot from the submarine dropped 100 yards off our starboard beam, the range perfect. The third shot off the port beam with the same range. As there was a heavy ground swell running, it is believed that caused the submarine to miss hitting the *Silver Shell*. The fourth shot passed over the bridge, and the following shots passed over to the right and left. The submarine all this time was gaining on the *Silver Shell*. The submarine appeared to be 250 to 300 feet long. There were two guns mounted on the deck, a 6-inch (apparently) gun forward of the conning tower and a smaller gun aft. The forward gun was the only one used. The first shot fired at the submarine only reached half way, as the submarine was about 7,000 yards off.

The engagement lasted from 6 p. m. until 7.27 p. m. There were no casualties. As soon as the submarine fired the first shot an S O S call was sent out giving the position and course, which was answered by F U T (Toulon) stating assistance was under way. A few seconds after a Spanish ship commenced sending with her wireless with apparent intent to block our message.

The master of the *Silver Shell*, John Charlton, was convinced that the submarine was destroyed, and in his report said:

The submarine sheered off and, still gaining, ran along parallel on the port quarter, in the smoke of the steamer most of the time. When he considered them close enough, Capt. Charlton gave orders to fire. The submarine returned this immediately, the shot dropping about 20 yards off the starboard beam. The speed of the *Silver Shell*

had been raised to 14 knots, but the submarine continued to gain. At about 7 p. m. one of the shots of the steamer struck the submarine flush, hitting the ammunition on the deck. There was a flash of flame, and within a minute she had disappeared. The merchantman kept on its course in the belief that it might be a trick; the captain now, however, in view of the fact that the crew were still on the deck when it submerged, is firmly convinced that it was destroyed. The submarine was about 250 feet long, painted a dark gray color, and very high out of the water. Wires, evidently for wireless, ran aft to the stern from the tip of one of the two periscopes. These were very short and mounted on the conning tower, which was 10 or 12 feet high. There were two guns, one forward and one aft of the conning tower. From the sound of the explosions of the guns and the column of water thrown up by the shells, the captain believes that they were either five or six inch.

Capt. John R. Edie, United States Navy (retired), who investigated the encounter, made the following report, dated Toulon, June 3, 1917, to the United States naval attaché, Paris:

1. Confirm following telegram sent last night on returning to Toulon:

"Sent statements from *Silver Shell* to-day. Chief Turret Captain W. J. Clark, in charge of guard, wants 150 rounds four-inch. Ship leaves Cette for Sumatra via Suez June 8. Clark also asks that supply officer, navy yard, New York, renew his expired allotment to his wife. Strong evidence submarine was sunk."

I questioned Clark very closely about the last two shots. He said that he purposely kept all his shots rather short and that none passed over the submarine. He was anxious for her to get a little closer. Just before the last shot, a shell from the submarine passed directly over the bridge of the *Silver Shell* and well beyond. At that moment he saw his twenty-fifth shot as a hit, "her bow seemed to raise up as though there had been an explosion in her, and then she plunged down with her stern up at an angle of 45°. He thought that he saw a cloud of white vapor as she went down, but that it may have been just spray.

He is sure that the time elapsed between her shell passing over the bridge and her disappearance was entirely too short for a gun's crew to have gotten back into the submarine. He said it was scarcely long enough to count 10, possibly between 5 and 10 seconds, but hard to estimate at such a time.

The captain, John Charlton, corroborated Clark's statements absolutely, and he said they were both watching the submarine with their glasses during the whole fight.

The captain said that Clark controlled the fire of his gun absolutely, and that the deliberate shooting and accuracy of the last shots were entirely due to the perfect control that Clark had over his gun's crew.

At the prefecture this morning there is no report of any submarine being sighted in that vicinity since the engagement with the *Silver Shell*.

During the fight the submarine made signals (radio) that the course was southeast to mislead the patrols. Those signals were received here. Capt. Charlton assured me that they never headed southeast and never anything but west by south to southwest until he went back on his course to north.

There is no doubt in my mind but that the submarine was sunk and that W. J. Clark deserves the credit for the good shooting and Capt. Charlton the credit for handling his ship in such a manner as to make the good shooting possible; he kept a straight course and did not zigzag at all.

STEAMSHIP "NYANZA," JANUARY 13, 1918.

Engagement of steamship *Nyanza* with submarine on January 13, 1918, 30 miles west-southwest of Penmarch. Chief Gunner's Mate Benjamin H. Groves, commanding armed guard, reported:

At 9.30 a. m., Sunday, January 13, 1918, a periscope, silver painted, was sighted off the port beam about 1,000 yards distant. At the same time the torpedo was observed approaching toward us. The helm was put hard a port, and the vessel's stern swung clear in time. The helm was then steadied, and the submarine brought astern (torpedo missed by about 10 feet).

We opened fire with the stern gun, the sights being set at 1,500 yards. The first shot fell about 100 yards short, and the sights were raised to 2,500 yards. The second shot fell about 30 yards short of the periscope.

The submarine fell rapidly astern, then came to the surface, started her oil engine, and gave chase. At about 7,000 yards the submarine opened fire with two guns, using

shrapnel. The guns were mounted forward and abaft the conning tower. In order to use them both at the same time she zigzagged, which caused her to drop astern. Then she would come after us again, approaching to within 5,000 yards. At first her shots fell short, but eventually he got our range and hit us five times. One shot passed through the after-gun platform, through the wood shelter house, through the iron deck—breaking a deck beam—exploding in the hold, and passing out through the side of the ship. One shot exploded in the armed guard's mess room, wrecking the place completely. Two shots exploded in a steam locomotive on deck, doing some damage. One shot hit the stern of the ship, but did not go through.

About 11.15 the submarine had our range good again. The captain of our ship zigzagged a little, which caused his shots to fall a little to the right or left of our ship. At the same time I had his range and fired four shells quick at 7,800 yards, causing him to come broadside to and keel over, then suddenly disappeared just as he had our own range good. This leads me to think he did not quit from choice, but from necessity.

The engagement lasted 2 hours and 30 minutes. I fired 92 rounds, and the submarine fired approximately 200. The guns' crew throughout the engagement behaved coolly, doing their duty and gaining experience which I think will be manifested in the next attack.

Three men of the guns' crew had their clothes torn more or less by the shrapnel. One engineer cadet was wounded, and taken to the hospital on arrival in port.

[First indorsement.]

UNITED STATES NAVAL FORCES IN FRANCE,
U. S. S. "PANTHER," FLAGSHIP,
Base Seven, January 18, 1918.

From: Commander United States naval forces in France.

To: Force commander.

1. Forwarded.
2. The *Nyanza* at the time of this attack, was proceeding independently to St. Nazaire, having become separated from New York convoy, *H. N. 35*.
3. The master of the *Nyanza*, the second officer, the lookout who sighted the torpedo wake, and the naval gun crew are recommended for commendation for their effective conduct on this occasion.

H. B. WILSON.

[Second indorsement.]

January 26, 1918.

From: Force commander.

To: Secretary of the Navy (Operations).

1. Forwarded, approving the first indorsement.
2. The *Nyanza*, was undoubtedly saved by the prompt work of the ship personnel and by the efficient work of the guns' crew.

SIMS.

S. S. "NAVAJO," July 5, 1917.

Engagement of the steamship *Navajo* with a submarine in the English Channel July 5, 1917. The official report of the court of inquiry made to the French Ministry of Marine from Havre concluded:

"The result of the inquiry is that the fight was very well conducted and that the men showed a very fine spirit, doing honor to the American Navy. The conclusion may be drawn that the submarine was hit and probably sunk."

Chief Boatswain's Mate H. L. Ham, commanding the armed guard, reported:

"On July 4, at 9.20 a. m., heavy gunfire was heard to starboard and shortly afterward the *Navajo* ran out of the mist and sighted a submarine firing on a British topsail schooner about 2 miles away. The *Navajo* changed her course, the fog shut down again and the 'sub' was lost sight of. This was about 55 miles northwest of Cape La Hague, France.

"About 2.55 p. m., the same day the fog lifted and two shots were heard from a point 1,500 yards distant. Upon observation a submarine was seen firing with both guns at the *Navajo*. The first shot dropped 50 yards short on the starboard beam; the second one went over the ship. The *Navajo* was swung, bringing the submarine about three points on the starboard quarter, and opened fire with her after gun.

"The submarine fired about 40 shots during the engagement, which lasted 40 minutes, one of which hit the *Navajo* underneath the port counter. This shell exploded before hitting the ship and displaced some of the plates, causing the *Navajo* to leak.

"The *Navajo* in return fired 27 shots, the last two of which were hits. The twenty-seventh shot struck the submarine just forward of the conning tower where the ammunition hoist was located, causing an explosion on board the submarine which was plainly heard on the *Navajo*. The men who were on deck at the guns and had not jumped overboard ran aft. The submarine then carted forward at almost 40 degrees and the propeller could be seen lashing the air. Nobody was seen coming up through the conning tower and jumping into the sea, nor were any survivors seen."

The commander of the armed guard concluded: "It is my opinion that the submarine was sunk."

STEAMSHIP "*BORINQUEN*," October 7, 1917.

Encounter of the steamship *Borinquen* with submarine on October 7, 1917, 11.45 p. m.; latitude 47° N., longitude 8° 05' W.

Chief Gunner's Mate T. J. Beerman, commanding armed guard, reported:

"Submarine was laying to when first sighted. We think she was receiving news from her headquarters. After gun could not bear on her then and while the trainer was training gun around to bear, loader fired pistol to wake up men in the shelter house, at the same time hoisting our colors. Pointer turned on lights and dropped sights from 500 yards to 100 yards. As soon as after gun could bear she opened fire. I did not see the first shot, but petty officer said it went just over top of submarine's conning tower. I saw the second shot hit, exploding and carrying away the conning tower. She was about three points abaft to port beam. The captain putting stern to submarine, the third shot was fired about astern. I saw it hit and explode. Before the helmsman could get control of ship the submarine lay off the starboard quarter in trough of sea. After second shot the submarine seemed to be stopped and lay in trough of sea at the mercy of the gun. Pointer raised sights to 300 yards and fired a fourth shot, this fourth shot falling 10 to 25 yards short. The last seen of her she was going down on swell, listed to port with her bow sticking in air and her stern down. She was going down in an upright position."

STEAMSHIP "*NORLINA*," June 4, 1917.

Engagement of steamship *Norlina* with submarine June 4, 1917; latitude 56° 32' N., longitude 10° 46' W.

Chief Boatswain's Mate O. J. Gullickson reported:

"At 6.30 p. m. man of forward gun platform shouted 'torpedo.' First mate, Mr. Robinson, lieutenant United States Naval Reserve Force, a Greek helmsman, and myself being on the bridge, the captain having just gone below. Wheel was put hard astarboard, toward the torpedo. The torpedo hit just abaft the beam glanced off aft around the stern, and sank. The first mate sounded the 'abandon ship' signal; all hands made for the lifeboats, the boats being lowered. Capt. J. Foster, lieutenant commander United States Naval Reserve Force; Mr. Robinson, first mate, lieutenant United States Naval Reserve Force; Mr. Lloyd, second mate; P. Savage, B. M. first class; and myself remained with the ship. Inspected the holds, engine room, and sounded the bilges. Found ship not to be leaking, and called all hands aboard, as torpedo apparently did not explode.

"As boats came alongside, a periscope was sighted off the starboard beam. Guns were manned; commenced firing from forward gun range 2,000 yards. In the meantime the captain had gotten the engineers below and we got under way, heading toward periscope. Continued firing from both guns, all shots coming very close to the periscope, submarine changing speed.

"Suddenly shot from forward gun; hit just in front of periscope, making it submerge, and a light blue smoke come up from astern of the submarine. Periscope appeared again, range now 600 yards, when a shot from the after gun hit it square on the water line, making small bits of steel fly, which may have been bursting of shell and causing a great commotion of bubbles, etc., in the water.

"In the meanwhile the captain, seeing the submarine getting closer all the time and expecting another torpedo any second, ordered all engineers on deck, causing the ship to be absolutely still in the water during most of the firing. Hoisted in all boats, laying to from 6.30 until 9.05 p. m., seeing no more of submarine, which was apparently either sunk or badly damaged."

The *Norlina's* master, Capt. J. Foster, made this entry in the ship's log:

"Monday, June 4, at 6.30 p. m., when in latitude 56° 38' north and longitude 12° 20' west, with Inishtrahull Island bearing south 66 east true, distant 180 miles, the ship was attacked by a submarine with her periscope only showing, which suddenly appeared off the port beam.

"The ship was hit about amidships by a torpedo, which apparently failed to explode. Not knowing the extent of damage done to the ship, the engines were stopped, the boats lowered, and all the crew, except the master, first and second officers, chief boatswain's mate, United States Navy, in charge of the armed guard, and one of his men, boatswain's mate, first class, United States Navy, abandoned the ship.

"As the vessel did not appear to settle the bilges were sounded, and as they proved dry the boats were called alongside, the crew gotten aboard, and guns manned just as the periscope of the submarine was seen approaching off the starboard beam.

"The naval crew began firing with both forward and after guns, and after 17 shots succeeded in apparently knocking away the periscope, as it disappeared and was not seen again.

"It seems certain that the submarine was either sunk or seriously disabled, for the ship remained in the vicinity nearly two hours getting the boats up. At 9.05 the ship was put on her course and proceeded. The range given the gun which knocked away the periscope was 600 yards."

STEAMSHIP "W. H. TILFORD," June 8, 1917.

The steamship *W. H. Tilford* in encounter with submarine on June 8, 1917. Commander armed guard reported:

"At 11.40 a. m., when this vessel was off Spezia Bay, Italy, a periscope moving parallel to the course of the vessel was sighted about 1,500 yards off the starboard beam; 20 rounds were fired rapidly. Some of the shells took effect, because the submarine came to the surface and made for the beach, where the escort, a small Italian torpedo boat, took charge of her."

STEAMSHIP "CHINCHA," January 18, 1918.

The steamship *Chincha* in encounter with a submarine on January 18, 1918. Chief Gunner's Mate E. E. Nordquist, commanding the armed guard, reported:

"On January 18 at 7.25 a. m., off the Spanish coast about 2½ miles off Sabinal Point an object like an enormous whale showed itself off our port quarter about 2,000 yards away. At 7.45 a. m. the wake of some big object was seen off our starboard quarter about 2,200 yards away. As it came up I had a good look at it and decided it was one of the latest type submarines I had heard of, without conning tower or periscope. It ran close to the surface, showing its bow and flush deck occasionally. I could see its bow waves and churn of its propeller exactly the same as I had seen submarines in maneuvers around the United States coast when awash, but minus conning tower and periscope.

"I commenced firing, range 2,200 yards. After third shot all shots fired were good. Fired 10 shots, when submarine disappeared. At 8.15 submarine again showed itself about 2,000 yards off our starboard quarter. Commenced firing fifth shot, which caused an explosion and a volume of black smoke was seen. Submarine now turned around and headed away from us. As submarine did not dive I continued the fire. Although nearly all shots seemed to hit, but five exploded. The fourth explosion caused another volume of black smoke. The submarine did not try to dive, but seemed to be trying to come up. As I thought she was trying to come up for shell fire at us I kept on firing.

"The submarine now headed for the beach about 1½ miles away; 29 shots had been fired at her the second time. One of the last shots had hit and exploded close, or at where her propellers were churning. As she was heading for the beach and quite a ways off, I ceased firing. The bow swells of the submarine could still be seen, but the churn of the propellers had ceased. Shortly all disappeared, about 4,000 yards away. Last range, 3,600. The depth where the submarine disappeared was about 10 or 15 fathoms. Where we were running it was 25 fathoms of water, so submarine could have dived toward sea if there was not enough depth toward land."

All of these are just samples and extracts of reports, and I think they show clearly that Admiral Sims committed a very great error and did a great injustice to the American commanders when he permitted the Admiralty of any other country to decide what credit should be given to American ships encountering submarines.

THE NAVAL CONSULTING BOARD ORGANIZED IN 1915 AS AN AGENCY OF
PREPAREDNESS.

You have heard many jeremiads about the lack of vision of the Navy Department before our entrance in the war. These criticisms in the main have come from critics who themselves never proposed any plan for readiness. So far as the civilian Secretary of the Navy is concerned, he not only in the fall of 1915 urged upon Congress the great three-year building program and a large increase in regulars and additions to the reserves, but in the early summer of 1915 sought to secure the application of the best brains in America upon meeting new naval problems. I procured an interchange of views and joint study by the ablest engineers, scientists, and experts in civilian life and the ablest experts in the naval service. On July 7, 1915, I sent the following letter to Mr. Thomas A. Edison, an inventor and engineer and thinker of world reputation, whose ability is exceeded only by his noble patriotism:

JULY 7, 1915.

Hon. THOMAS A. EDISON,
East Orange, N. J.

DEAR MR. EDISON: I have been intending for some time to write you expressing my admiration at the splendid and patriotic attitude you have taken, as reported in the public press, in refusing to devote your great inventive genius to warlike subjects except at the call of your own country. Such an attitude, in these all too commercial times, is one that should be an inspiration to our young men and a lesson in the pre-eminent right of one's own country to the best that its citizens have that will be of tremendous benefit to us all.

I have deferred writing you, however, because, at the same time, I wanted to take up with you another matter to which I have given a great deal of thought—a matter in which I think your ideas and mine coincide, if an interview with you recently published in the New York Times was correct. There is a very great service that you can render the Navy and the country at large and which I am encouraged to believe, from a paragraph in Mr. Marshall's interview, you will consent to undertake, as it seems to be in line with your own thoughts.

One of the imperative needs of the Navy, in my judgment, is machinery and facilities for utilizing the natural inventive genius of Americans to meet the new conditions of warfare as shown abroad, and it is my intention, if a practical way can be worked out, as I think it can be, to establish, at the earliest moment, a department of invention and development, to which all ideas and suggestions, either from the service or from civilian inventors, can be referred for determination as to whether they contain practical suggestions for us to take up and perfect.

We, of course, receive many suggestions, but our only way of handling them at present is to leave them to various bureaus already overcrowded with routine work, and it is not always possible to give the necessary attention to propositions that are not so definitely worked out as to make them immediately available for the service. Ideas which contain the germ of improvement can not always be given attention they deserve, as there is at present no adequately equipped department to which to send them for the careful study required. In addition, our naval officers, particularly those at sea, are in a position to note where improvements are needed and to devise ways in which those improvements can be made. They have, however, neither the time nor the special training, nor, in many cases, the natural inventive turn of mind needed to put these ideas into definite shape. Were there a place where they could be sent to be worked out and perfected, I am sure we would get many noteworthy improvements from this course alone. We have, of course, in the Navy Department energetic and wide-awake bureaus, headed by experts in their particular lines of work who devote all the time they possibly can to a study of this problem. They have made important contributions to the improvements in the implements of naval warfare and are doing all that is possible with their other large duties. There are, unfortunately, no officers now detailed who can take time from the mass of work which they are called upon to do in order to devote it fully to studying new suggestions and inventions.

The department is also unprovided with the best facilities for work of pure experimentation and investigation, with the exception of our testing station at Annapolis, which is, as yet, a small affair. Most of all, as I have said, there is no particular place or particular body of men, relieved of other work, charged solely with the duty of either devising new things themselves or perfecting the crude ideas that are submitted to the department by our naturally inventive people.

I have in mind a general plan of organizing such a department which is still very hazy as to details, but which, in a general way, meets, so far as the Navy is concerned, with your ideas of such a department for the Government in general. I want to use such facilities for experimental and investigation work as we have, under the direction of men particularly selected for ability shown in this direction, to whom would be referred all suggestions of new devices sent in to the department and who would work out such ideas to a practical point. Such a department will, of course, have to be eventually supported by Congress, with sufficient appropriations made for its proper development, although I feel that we can make a start with the means at hand.

To get this support, Congress must be made to feel that the idea is supported by the people, and I feel that our chances of getting the public interested and back of this project will be enormously increased if we can have, at the start, some man whose inventive genius is recognized by the whole world to assist us in consultation from time to time on matters of sufficient importance to bring to his attention. You are recognized by all of us as the one man above all others who can turn dreams into realities and who has at his command, in addition to his own wonderful mind, the finest facilities in the world for such work.

What I want to ask is if you would be willing, as a service to your country, to act as an adviser to this board, take such things as seem to you to be of value but which we are not at present equipped to investigate, and to use your own magnificent facilities in such investigation if you feel it worth while. For our part, we will endeavor not to bother you with trivial matters as we will probably have sufficient facilities to handle such small matters as they come up. This is a great deal to ask and I, unfortunately, have nothing but the thanks of the Navy and, I think, of the country at large, together with the feeling of service to your country that you will, to offer you by way of recompense; yet, so clearly have you shown your patriotism and your unselfish loyalty to your country's interests, that I feel justified in making this request.

We are confronted with a new and terrible engine of warfare in the submarine, to consider only one of the big things which I have in mind, and I feel sure that, with the practical knowledge of the officers of the Navy, with a department composed of the keenest and most inventive minds that we can gather together, and with your own wonderful brain to aid us, the United States will be able as in the past to meet this new danger with the new devices that will assure peace to our country by their effectiveness.

If you feel that you would be willing to do this, I would like a little later, when my plans are somewhat more matured, to consult with you as to the details of the organization proposed so that I can make it as effective as possible for the purpose intended.

With you it might be well to associate a few men prominent in special lines of inventive research, and I would like also to consult with you as to who these men should be. It is, of course, your aid that I rely upon most, and if you are not able for any reason to do this, I will frankly hesitate to undertake the matter at all. Should you feel like accepting the task, however, I know the relief which the country would feel in these trying times at the announcement that you are aiding us in this all important matter.

If you could let me know as early as you may, how you feel about this, I would appreciate it, as everything waits upon your answer, and I think we can not be too expeditious if we are going to take this matter up at all.

Sincerely, yours,

JOSEPHUS DANIELS,
Secretary of the Navy.

That letter, Mr. Chairman, was actually written in July, 1915, after much consideration, in 1915 a short time after the sinking of the *Lusitania*, and I submit it as showing that we were very alert at that time.

The CHAIRMAN. That is also in your report?

Secretary DANIELS. Yes.

Upon receipt of the above letter Mr. Edison sent an assistant, Mr. Hutchison, to Washington, who communicated Mr. Edison's views,

of the best method of securing the cooperation of the engineering and inventive talent of the country. Some days later I went to Orange, N. J., to confer more fully with Mr. Edison upon the best way of securing the men who were best qualified to render the highest and most useful service. We both felt that its usefulness was dependent upon its freedom from personal or political influences, and it was decided that instead of the Secretary of the Navy inviting certain men eminent in their profession to become members of the board it would be wisest and secure larger cooperation by asking 11 of the best scientific societies in America each to select two of its members as members of the naval consulting board, men who possessed a high order of patriotism, wide business experience, and were of such broad mind that the inventive genius of America could have an opportunity of submitting their ideas for judgment without fear or prejudice.

The following is a copy of a letter I addressed to the president of the American Institute and a like letter was sent to the president of 10 other societies:

THE PRESIDENT AMERICAN INSTITUTE, SOCIETY, ETC.

MY DEAR SIR: A few days ago, as you have doubtless seen in the papers, desiring to make available the latent inventive genius of our country to improve our Navy, I requested Mr. Thomas A. Edison to become chairman of an advisory committee of eminent men who would make up the committee. Mr. Edison, with the patriotism characteristic of American inventors, accepted the call to duty. I am writing to ask the membership of your institute, society, etc., to give practical and valuable aid and needed cooperation by selecting representatives of their body to serve as members of the advisory committee. It is believed that the best results can be obtained only by such selection of the membership as will be representative of the inventive genius and scientific knowledge found in the membership of your own and kindred societies.

Will you not, as president of the American Institute, society, etc., arrange to secure the selection of two of its members to serve on this advisory board? I feel that the work your institute, society, etc., has done has been such as to give it the right to be, in a way, officially represented, and the Navy Department desires in this way to testify to its own appreciation of the splendid work for our country that your institute, society, etc., has done. In addition, I feel that the judgment of your members as to who is best qualified among you to serve on this board will be far better than my own.

I am going to ask you, by a poll, by letter of your members, or in whatever way seems to you most certain of securing the men desired by the majority of your organization, to choose two of your members to serve on this board, and it will give me great pleasure when you have furnished me these names, to extend the gentlemen the formal invitation of the department.

We are anxious to begin as soon as possible, and, if your institute, society, etc., can furnish me the names at an early date, it will help the prompt organization of the advisory board very much. In adopting this course, I have the emphatic approval of Mr. Edison, and he agrees entirely with me that your institution, society, etc., should be represented in this way and that no better method of getting the kind of men we need could be devised.

The public press has so fully set forth the general plan that I feel it unnecessary to explain to you the purposes of this board, but am inclosing a copy of the original letter I wrote to Mr. Edison and the statement given to the press upon receipt of his message that he would serve.

Thanking you in advance for the great service which I feel sure your institute, society, etc., will be glad to render to our common country, I am

Sincerely, yours,

JOSEPHUS DANIELS,
Secretary of the Navy.

The result of this request was the formation of the naval consulting board and the following-named membership:

American Mathematical Society: Dr. R. S. Woodward, Dr. Arthur Gordon Webster.

American Society of Civil Engineers: Mr. A. M. Hunt, Mr. Alfred Craven.

American Aeronautical Society: Mr. M. B. Sellers, Mr. Hudson Maxim.

Inventors' Guild: Mr. Thomas Robins.

American Institute of Mining Engineers: Mr. William L. Saunders, Mr. Benjamin B. Thayer.

American Electro-Chemical Society: Mr. Lawrence Addicks, Dr. Joseph W. Richards.

American Society of Mechanical Engineers: Mr. W. L. R. Emmet, Mr. Spencer Miller.

American Society of Aeronautic Engineers: Mr. Elmer A. Sperry, Mr. Bion J. Arnold.

American Society of Automotive Engineers: Mr. Howard E. Coffin, Mr. Andrew L. Riker.

American Chemical Society: Dr. L. H. Baekeland, Dr. W. R. Whitney.

American Institute of Electrical Engineers: Mr. B. G. Lamme, Mr. Frank J. Sprague.

And Mr. Thomas Alva Edison, with his assistant, Dr. M. R. Hutchinson.

It was understood that Mr. Edison, elected as he was unanimously as president of the board, would not be requested to give his time to the administration, organization, management, and direction of the activities of the board, but would be free to carry on his research on naval problems in such a way as he elected, and therefore the administrative work and development plans devolved upon the elected chairman, Mr. W. L. Saunders, a well-known engineer and business executive of New York, whose service can not be too highly commended.

Mr. D. W. Brunton, chairman of the war committee of technical societies, was later elected and appointed a member of the board.

In an act of Congress making appropriations for the Navy—the greatest single naval act in American history—approved August 29, 1916, there was included a provision providing for the expenses of the Civilian Naval Consulting Board, thus legalizing the board and making it the chief unofficial research organization working with and for the Government.

Before the entrance of America into the World War the board was occupied with the study of varied problems, some presented by the department and some initiated by members and others, and plans for the formation of a naval research and experimental laboratory. Mr. Edison and some members of the committee thereon appeared before the House Naval Committee and presented well-considered plans and specifications for its construction, and Congress approved. War delayed its erection, but it will be realized shortly.

In accordance with one of the objects intended, viz, the efficiency of the Navy for war, the board took up the question of national preparedness, and in conjunction with the department, undertook under the expert direction of Mr. Howard E. Coffin, a campaign of industrial preparedness and obtained results unheard of in any other country. It won unstinted praise from the press of Great Britain and other countries and the warm admiration of all our own forward-looking American citizens.

Early in 1916 a number of problems were formulated by the different bureaus of the Navy Department and distributed to the appropriate committees for solution.

The naval fuel oil board requested the assistance of the consulting board and a combined meeting was held in New York, at which were gathered many of the best known authorities on the subject and information was gathered that has been of great value.

Early in 1917, when the prospect of an early entrance into the war became great, the activities of the board greatly increased and on March 3, 1917, before we entered the war, the special problems committee that had been formed at an early meeting of that year, called a special meeting in New York City. This meeting was attended by members of the board, 35 additional prominent scientists, officers from the department; the submarine flotilla, the torpedo station at Newport, and Admiral Sims, then president of the War College.

Subjects relating to preparation for war, such as the detection of the submarine, protection against torpedo attack, the destruction of the submarine when detected, and mine attack and defense. Confidential information was freely given by the naval officers present and full discussion was encouraged. Out of this meeting there grew the stations for experimental work at Nahant and later the concentration of scientific work at the naval station at New London.

In April, 1917, Mr. Edison dropped all of his personal work and devoted his entire time to naval research and experiment. In all he investigated 46 separate and distinct subjects, among them torpedo detection, escape therefrom, invisibility of ships, and evolutions in escaping submarine and torpedo attack; and gave himself fully and wholly to a duty which will always endear him to the American people.

In the spring of 1917, both the office instituted by my order for the consideration, correlation, and filing of suggestions and ideas in conjunction with the bureaus of the department and the naval consulting board, were so overwhelmed with correspondence, that I directed the establishment of an office in New York under the direct superintendence of Mr. Thomas Robins, the secretary of the board. This office soon grew to considerable proportions, employing some 12 experienced engineers as examiners, the majority of whom volunteered their services, who were assisted by a large force in answering, filing, and mailing the vast correspondence of this office. In order to expedite action and to accommodate the inventors who desired a personal interview, an office was established in Chicago with the member from that city and the committee of associate members who so ably assisted with the industrial preparedness campaign. A similar office was established in San Francisco.

For the instruction of the large number of citizens submitting suggestions the department and the board prepared bulletins and these were issued to all who desired them.

To assist the department and confine its work to purely naval subjects the ship protection committee of the Emergency Fleet Corporation was formed at the request and instigation of the chairman of the board, and one of the most experienced members of this committee was the chairman of the committee on marine engineering and ship propulsion of the naval consulting board. This relieved

the Navy of the consideration of devices applicable to merchant vessels.

Mr. B. B. Thayer, the vice chairman of the board, was of special value in obtaining officers for appointment in the naval reserve for electrical and engineering duty; also for duty on submarines. His committee nominated such a high class of applicants that the service was materially benefited thereby.

To enumerate the large number of subjects considered of a purely technical character, is unnecessary, but the board's contribution toward success was large. Its membership was imbued with a most patriotic spirit and a whole-souled desire to do everything on their part to win the war, and its service will rank as among the most important of all agencies.

The conception and formation of this board and its work of industrial preparedness led the way and had considerable influence in the constitution of the Council of National Defense and the valuable work done by its affiliated bodies. Upon the organization of the Council of National Defense, the Naval Consulting Board, with Mr. Edison as chairman, was requested to act as the naval board of inventions. It accepted, and in peace and in war is the national agency looked to for this special service. A statement of the suggestions, experiments, and achievements of the Naval Consulting Board, which began in 1915 and is to-day an active organization with important duties, requires a whole book to give an appreciation of its large usefulness. Such a book has been prepared and will soon come from the press, and will be one of the most interesting and valuable histories of war work, preparations for war, and vision of present day duties of increased naval efficiency.

REPORTS OF COMMITTEES OF CONGRESS AND STATEMENTS BY REPUBLICAN AND DEMOCRATIC LEADERS REGARDING THE NAVY'S PREPAREDNESS AND EFFICIENCY.

Leaders of both Senate and House, Republicans as well as Democrats, have paid the highest tributes to the efficiency of the Navy and the way in which it performed its work during the war.

The Naval Affairs Committee of the House, in December, 1917, appointed a subcommittee to "inquire into the activities of the Navy." That committee made a thorough investigation of the entire Naval Establishment, making a study of our various activities ashore and afloat. That committee, in its report made March 11, 1918, was unanimous, being signed by every member, Republicans as well as Democrats, set forth, in detail, how the Navy had met the many difficult problems of production and operations; how it had increased many times its personnel and the number of ships in service, and declared it "a remarkable record of achievement." That report concluded with the words: "Sirs, all is well with the Fleet."

The full report of that committee, presented March 11, 1918, nearly a year after our entrance into the war, is as follows:

The CHAIRMAN. Was this report published?

Secretary DANIELS. Yes.

The CHAIRMAN. So that we can get it from that?

Secretary DANIELS. Yes; it is in the report of the Secretary of the Navy, Appendix A, and I am certain that it was published by the committee.

The CHAIRMAN. It is in your report, at any rate?

Secretary DANIELS. It is in my report, I think, for 1918. I will not read it now. I trust you gentlemen will read it though. It is a document of historical importance.

(The report referred to is here printed in the record as follows:)

REPORT OF THE SUBCOMMITTEE FOR INVESTIGATION OF CONDUCT AND ADMINISTRATION
OF NAVAL AFFAIRS.

Hon. L. P. PADGETT,

Chairman of the House Committee on Naval Affairs.

The subcommittee appointed, just prior to the holiday recess, to inquire into the activities of the Navy, since our entrance into the war, submits to the full committee the following report:

We have had before us the Secretary of the Navy, Chief of Naval Operations, the chiefs of all the bureaus, the commandant of the Marine Corps, Chief of Naval Aviation, the Director of Target Practice, also other officials and witnesses. Many of our hearings were in executive session, full reports of which are now in the hands of the secretary of this committee and open to the inspection of its members. Much of the testimony submitted to us has been heard by the full committee in its consideration of the pending appropriation bill, and this fact assures, we think, the entire committee's ready concurrence in the following conclusions reached by us:

First. All appropriations have been expended or obligated with judgment, caution, and economy, when you consider that haste was necessary to bring results and abnormal conditions obtained in reference to all problems of production or operations.

Second. The Navy, with limited personnel and material, was suddenly called to face many difficult and untried problems in sea warfare, and has met the situation with rare skill, ingenuity, and dispatch, and a high degree of success.

Third. The efficiency of the Navy's prewar organization, the readiness and fitness of its men and ships for the difficult and arduous tasks imposed by war were early put to the acid test and thus far in no way have they been found wanting, and we feel that the past 12 months presents for the Navy a remarkable record of achievement, of steadily increasing power in both personnel and material, of rapidly expanding resources, and of well-matured plans for the future, whether the war be long or short duration.

Our committee undertook this investigation expecting to find that no matter how well in the main the Navy had made its expansion into a war force we would find some matters subject to adverse criticism. We brought with us the desire to cooperate with the Navy to the one end, success. An examination of the records will show how little occasion we have had to find fault. Some mistakes have, of course, been made, yet the Navy has shown its strength by the manner of its correction.

It is a matter of regret that the great demand upon the ship-construction capacity of the country, coupled with the urgent demand for a large increase in the destroyer force, has made necessary a temporary abandonment in part of the Navy shipbuilding program. The Navy greatly needs both scout and battle cruisers, without which our dreadnaught fleet loses a large part of its fighting potentiality. We approve the principle and earnestly favor a resumption of the building program, as soon as conditions permit, and can not too strongly emphasize the importance of providing both scout and battle cruisers.

That the expansion of the Navy has resulted in gain rather than loss of efficiency is primarily due to one factor, preparedness. This, we think, very fully appears from our reports on the bureaus, the office of operations, and the fleet, which follow:

BUREAU OF NAVIGATION.

The measure of the efficiency of the Navy is the efficiency of its personnel, and your committee feel that this important matter has been well handled by the Bureau of Navigation, of which Admiral Leigh C. Palmer is the chief. This bureau is charged with the duty of supplying both officers and enlisted men and of providing for their proper training and assignment to service. In March last we had only about 55,000 men, including reserves, in the naval service. This number has been rapidly

increased until it approximates now 300,000. All enlistments are practically for the full four-year period (the full time permitted).

Under the enlistment plan the country was divided into four districts, the purpose being to reach the parents of these districts and to explain the real advantages of the Navy. The plan proved so successful that every district turned in far more than its quota of enlistments, which necessitated the slowing down of recruiting to prevent crowding the men in training stations. At the commencement of the war our training stations could only accommodate about 6,000 apprentice seamen, but Admiral Palmer early assumed the responsibility of increasing the housing rooms at the various stations, and we now have at the regular training stations barracks for more than 50,000 men. Additional barracks and schools have been provided in every naval district for the training of officers and men, and many schools and colleges have likewise been called on and are now assisting in the training of specialists along different lines. These training stations and schools cover a large number of trades in addition to the regular naval work, including thorough courses for divers, electricians, radio men, carpenters, machinists, blacksmiths, coppersmiths, bakers, Hospital Corps men, camouflage men, musicians, gunners, signalmen, steel and concrete construction men, quartermasters, helmsmen, lookouts, armed guards crews, men for submarine work, motor boat and torpedo men, etc. Training was also started in the battleship force, and every vessel at home and abroad has become an active training school for officers and men in addition to carrying out the other important duties of the fleet. Trained destroyers and patrol-boat men from the war zone are being brought back from time to time as nucleus crews to man new vessels that are now being constantly put in commission. Since April last more than 1,000 vessels have been put in commission by this bureau, including battleships, submarines, destroyers, transports, hospital ships, patrol vessels, mine layers, mine sweepers, submarine chasers, cruisers, colliers, supply vessels, converted yachts, gunboats, etc. The bureau deserves much credit for its promptness in filling all orders for trained personnel, and every vessel afloat, we learn, is now filled to the maximum complement desired by the officer in command.

The whole problem of training and supplying officers and men, Admiral Palmer assures us, has been worked out in detail for a year in advance, after first taking into consideration the number of vessels which will be completed and commissioned and the duties to which they will be assigned. This schedule shows where the supply of officers and men of the required rank and ratings will come from, where they will be trained, and where assigned. It allows for unforeseen casualties and new operations and, we are told, will automatically deliver the required number of trained officers and men for any activities authorized or contemplated now or in future, covering a period of several years. The Navy reserve force has been efficiently organized and many additional details of personnel have been met by the bureau, including the naval radio censorship, communication service, naval intelligence, and supply of reserve clerks for the bureaus.

Charts and navigation books and instruments of all kinds have been furnished the fleets in home and foreign waters, and we feel that the bureau wisely maintains the closest cooperation with the commander in chief of the Atlantic Fleet, and the commander of the forces operating abroad on the subject of supply and detail of personnel. Our committee has been impressed with the ability and systematic methods adopted by this bureau for the handling of these important matters intrusted to it.

THE MEDICAL DEPARTMENT.

The first battle of the war, that against disease, was fought and won by the Medical Department of the Navy, under Rear Admiral William Braisted.

After diplomatic relations with Germany were broken in February, 1917, recruits, we find, streamed into the service in increasing numbers, and in April there was grave danger that the overwhelming influx of volunteers would overtax all training stations and receiving-ship facilities and bring disaster to the Navy at the very beginning of the war by the introduction and spread of epidemic diseases which, unfortunately, were widely prevalent throughout the country at that time.

The Navy in this early critical period was fortunate in having as its Surgeon General a farseeing man, of the clearest judgment, who had the confidence of the medical profession at large and who inspired confidence and loyalty in his own corps. Admiral Braisted, possessed of unusual ability as an organizer and administrator, and an intimate knowledge of the needs of the service, was eminently fitted to direct the activities of the Medical Department. Patient and optimistic, and with a quiet force of character which accomplished results, he began at once, without delaying even for appropriations, to prepare for eventualities which he clearly foresaw. Except an occasional outbreak of those diseases which commonly occur among recruits, the

health of the Navy has been quite as good as in times of peace. In spite of all the difficulties in the way of rapid expansion and the sudden necessity for the training of new medical personnel and hospital corpsmen, the health of the force afloat has been even better than in peace times.

The Medical Department facilities have undergone tremendous development everywhere. The excellent and finely equipped base hospitals, which were built before the war, largely through foresight on the part of the Surgeon General, have been greatly expanded with a speed which could not have been attained if the organization of the Medical Department as a whole had not been carefully thought out long before the war came and plans perfected for the immediate enlargement of base hospitals and the construction of emergency hospitals of the finest type wherever necessary. The total bed capacity of naval hospitals was thus increased in a period of a few months from 3,800 to more than 15,000 beds. The mothers of the country can rest assured that in these hospitals their sons will receive excellent care and nursing and the most skilled treatment that modern medical and surgical knowledge permits. The naval hospitals at Great Lakes, Ill., and Norfolk, Va., are already two of the largest hospitals in the United States, and with the authorized additions to the Norfolk hospital it will be one of the greatest institutions of its type in the world. The Navy Nurse Corps, comprising women of the highest type in the nursing profession, has been increased to more than 700.

On board ship and at naval stations the health of the men is protected by all the safeguards known to preventive medicine. The Hospital Corps, upon which falls exclusively the nursing of the sick and wounded outside of hospitals, has been increased from 1,500 to nearly 9,000.

Hospital Corps training schools have been established in connection with the training stations at San Francisco, Great Lakes, Newport (R. I.), and Hampton Roads. In these schools young men of good character and aptitude are intensively trained for their duties at sea.

Foreseeing that the hospital ship now under construction, and which the Surgeon General had long asked for, would not be completed in time to meet the war needs of the service, two large liners were secured and converted into hospital ships to supplement the work of the hospital ship *Solara*. To assist the Army in bringing back the sick and wounded from abroad, Admiral Braisted arranged that the transports operated by the Navy should have ample Medical Department facilities and necessary equipment, and, so far as naval facilities exist, has assumed responsibility for the medical and surgical care of all Army sick and wounded who may be transported home on naval vessels from Europe.

For the care of our naval forces in England, France, and European waters, three base hospitals are already in operation abroad.

In expanding the Medical Department to meet the present and future needs of the Navy, we were glad to find that the needs of the increasing numbers of industrial workers and other civil employees in the large manufacturing plants in navy yards had not been overlooked. The peace-time humanitarian work is also being continued in connection with Haiti, Santo Domingo, Virgin Islands, Samoa, and Guam, involving a population of over 2,000,000 people.

It may well be said that the reason for this successful record is to be found in the bureau's preparedness, due to foresight and cooperation.

BUREAU OF SUPPLIES AND ACCOUNTS.

The Bureau of Supplies and Accounts is the Navy's great business office, and incidentally it is one of the biggest enterprises in the United States. Under its chief, Rear Admiral Samuel McGowan, it has established and well deserves a nation-wide reputation for business efficiency.

It has the responsibility of feeding, clothing, and paying the entire personnel of the Navy, and supplying all vessels of the Navy with stores and equipment for efficient operation. When war came, it found the bureau with a peace-time organization of 128 officers and civilians. That personnel, however, had been so constantly indoctrinated with the Paymaster General's policy of doing everything with a view of preparing for any eventuality, that it needed only augmentation to handle smoothly the vast increase in its daily business details. The personnel increased to more than 700, but the system remained unchanged, and the result was that 300,000 men and 1,100 ships were just as promptly and well provided for as 55,000 men and 300 ships had been before the war.

One of the most important problems the bureau had to solve was the placing of contracts and securing delivery of large stocks of winter clothing for a Navy that by winter had increased many times its original size.

This could not be accomplished by merely placing the contracts and then waiting delivery. The requirements for the Army and our Allies had made such a demand on the mills and on the manufacturers that all contracts had to be placed with the greatest care and under varying conditions to meet the Navy's immediate needs. The Paymaster General sent a number of commissioned officers to the mills and factories to talk to the employees and encourage them to increase production to the limit. These efforts were so successful that all men afloat and at the training camps and stations were, before cold weather came, provided with adequate outfits of winter clothing, including overcoats, heavy blankets, etc. The deck force of the destroyers, battleships, and other vessels were furnished with special articles of winter clothing, wind, and rain proof suits, heavy woolen socks, boots, etc., and thus well prepared to endure wind and weather.

The daily stocks of raw materials were rapidly increased and storehouses were erected at certain east coast yards to meet the enlarged demands for fitting out the greatly augmented fleet. By wise foresight, the bureau met immediate needs promptly, and in addition, provided a reserve supply of the more important articles of raw materials, such as tin, copper, steel, etc. The bureau, we find, has preserved its well-established "open-door" policy with respect to purchases of every kind for the Navy Establishment. Some idea of the magnitude of the increase in the Navy's purchases since the war may be gained from the fact that the total expenditure for an entire year in the comparatively recent past did not exceed nineteen millions, whereas expenditures are now being made at the rate of thirty millions a day.

The fact that the Navy has been able to secure prompt deliveries almost without exception under its contracts is due in a large measure to its elimination from the bidding list of all failing to comply with the following requirement of article 3722 of the Revised Statutes:

"No person shall be received as a contractor who is not a manufacturer of or regular dealer in the articles which he offers to supply."

When war came, the Navy by following this policy had a bidding list of contractors of known reliability, and as an automatic result, prompt in deliveries.

The Paymaster General, in all but a few confidential purchases, has insisted rightly that publicity protects the Navy and encourages competition, and this policy has been followed strictly in making purchases, and as a result, quality, quick deliveries, and lowest market prices have been obtained.

The finest spirit of cooperation exists in this department and one of loyalty to its chief and to its senior aid, Rear Admiral C. J. Peoples, the youngest officer of his rank in the Navy and one of the most efficient.

BUREAUS OF CONSTRUCTION AND REPAIR AND STEAM ENGINEERING.

We were impressed with the efficient and expeditious methods employed by the Bureaus of Construction and Repair, Rear Admiral David W. Taylor, and of Steam Engineering, Rear Admiral Robert S. Griff n, in handling the many difficult problems suddenly imposed by the war. Much of the information furnished us in this connection can not, for obvious reasons, be now disclosed, but in due time the country will understand how the skill and inventive genius of these bureaus have contributed to the efficiency of our own and allied navies.

We found that extensive preparations had been made by these bureaus before the outbreak of war; that large stores of material necessary for the repair and replacement of the ships in service had been accumulated and extensive contracts made for stores not ordinarily carried in peace times; that repair ships were thoroughly equipped and were ready to sail in condition to make any repairs that might be necessary in the destroyer force. As a result our destroyer force in the war zone has been maintained in a high state of efficiency, and had all repairs made without interfering with their service. Much of the credit for this is due not only to the seamanship and skill of their officers and crews, but to the thorough manner in which American crews understand the materials in their charge and the skill with which they utilize the same.

Navy yards were fully supplied with materials needed in connection with the big task of converting merchant vessels taken over, and arrangements had been made to supplement the navy yards by private yards in the vicinity, working under contracts arranged before the outbreak of war.

Many alterations were begun fully a month before hostilities were declared and extended to the point of actually making contracts in anticipation of the passage by Congress of appropriations for the purpose.

When it came to building additional destroyers, especially those of the large program, it was found that the shipbuilding facilities of the country were fully absorbed with the vessels then under construction and that it would be necessary to create

new facilities. The work involved the expansion of existing shipyards, the creation of entirely new yards, machine and boiler shops, great increases in forging facilities, and facilities for building auxiliary machinery. The plans adopted required more than doubling the capacity available last summer for building destroyers, and that capacity was materially greater than before the war. It is gratifying to report that during 1918 destroyers will be built in from a third to a half of the time taken under prewar conditions.

In spite of the speed in construction, these vessels are not being slighted in workmanship or appliances. They are equal in every respect and superior in some to our latest destroyers, and will be provided with all fittings for the comfort and convenience of the crew, and for military purposes.

The committee was given full information in regard to the damage done to the German ships which were turned over to the Navy and the methods followed in repairing them, and was impressed with the fact that while unusual and novel methods were resorted to to put these ships in service as quickly as possible, there has been up to date no case of failure or of weakness developing in any repairs undertaken by the Navy Department. With the completion of the *Leviathan* (*Vaterland*) the last one was repaired and put in service, making upward of a hundred German ships now flying the American flag.

A side light on German methods was furnished by a statement that there was found on one of the German ships a detailed memorandum of all damages that had been done, with a notation opposite each item as to whether the damage could or could not be repaired. In almost every case, the notation was "Can not be repaired," and the manner in which the work was accomplished is still no doubt a profound mystery to the skippers and engineers of the German ships who are now interned.

The committee found that no necessity had arisen for any change in the system of either of these bureaus, which readily expanded to meet the emergency. They have not only had at their command the assistance of American inventors and experts, but have been given full information of the devices developed and progress made by other navies and have worked in close conjunction with our allies.

BUREAU OF ORDNANCE.

The importance of the adequacy in power and quantity of the Navy's ordnance can not be overemphasized.

The Bureau of Ordnance, under Rear Admiral Ralph Earle, has fully satisfied the demands made upon it by the vessels operating in European waters. A letter from Vice Admiral Sims compliments the work and spirit of the Ordnance Department. Other officers in the war zone, writing in similar vein, have given like testimony.

As a preliminary to its hearings, the committee visited the offices of the Bureau of Ordnance and personally examined into the organization and operation of the bureau's administrative details. The committee was impressed with its business organization and capacity to handle the war work that comes under its immediate cognizance, the procurement of guns, mounts, shell, powder, fire-control appliances, and the numerous accessories required in the arming of our naval forces.

The signing up of a contract marks the beginning of action; the follow up and thorough inspection systems and the policy of full cooperation with the manufacturer are employed to insure prompt delivery.

The organization of the bureau had been developed so as to make it an organization for war, and in consequence it is working smoothly and efficiently, although the expenditures have increased from about \$30,000,000 to more than \$560,000,000. It has been augmented by taking into it retired officers, officers of the Naval Militia, officers of the Coast Guard Service, former graduates from Annapolis, and able men from civilian life as needed.

The bureau has developed much new material, including depth charges, submarine bomb, nonricochet shells, bomb-dropping devices, howitzers, guns for throwing depth charges, smoke-screen apparatus, heavier ordnance on all craft, and many other important designs which we feel it unwise to discuss.

Where there were shortages in the market of various materials, the bureau took steps immediately to develop new sources of supply. It placed contracts rapidly, and the committee is confident that the Navy's needs for ordnance during this war are fully covered by existing contracts and with the capacity now under its control.

Over 1,100 vessels have been furnished and equipped with guns, ammunition, spare parts, and all their auxiliaries since the fitting out of the *Campana*, the first ship to be so fitted out, on March 14, 1917.

Reserves of ammunition have been acquired, and money placed at the disposal of the Bureau of Ordnance we find has been spent wisely and has been obligated practically as soon as it became available.

The Navy's industrial ordnance plants have been and are being expanded as rapidly as practicable without interfering with their production. Without direct control of the gun factory, torpedo station, naval proving ground, powder factory, and ammunition depots the work accomplished would have been impossible.

It may be pertinent to here state that the bureau has furnished, in appreciable quantities, the Governments of England, France, and Italy with guns from the largest to the smallest caliber, together with proper supplies of ammunition therefor and is continuing the supply of such munitions to our allies. In addition to vessels of the regular navy of our allies, it has armed a considerable number of their merchantmen.

Depth charges, which the committee thinks may be properly termed "the best weapon against the submarine," have been produced in quantity and are in use by our destroyers and submarine chasers. An adequate reserve of ammunition for all classes of guns has been accumulated and is held in storage ready for the use of the fleet.

The committee was supplied with full information of how many attacks of submarines upon armed merchantmen had been warded off, the ships' gun crews using the battery with bravery and skill, and was given the details of certain engagements of special interest.

The arming of merchantmen and the use of other devices, including sailing in convoys, while doing much to keep down our percentage of losses, are not all that can be desired as a check to the submarine menace. The committee was furnished with the names, tonnage, and armament of all vessels under the American flag engaged in trans-Atlantic trade, together with dates and incidents of all encounters with submarines. The record of attacks on our armed merchantmen shows a comparatively small percentage were successful, and that the chances of escape when a submarine is sighted before she has time to fire a torpedo are very high, due to the efficiency of the Navy personnel. The unseen torpedo is responsible for 80 per cent of the sinkings.

BUREAU OF YARDS AND DOCKS.

At the commencement of the war naval docks and yards were wholly inadequate to meet the requirements of the Navy at war strength, but Congress in the last appropriation bill had provided liberally for improvements.

Rear Admiral Frederic R. Harris, chief of the bureau, gave the committee a full report on the activities set in motion to develop the yards and to erect the many structures required for training camps for the increased personnel.

In December last, 496 contracts, involving an expenditure of more than \$96,000,000, had been let for these improvements, 62 of these contracts, carrying about \$26,000,000—mostly for training camps—were made on the cost plus basis, but we found in every case that the bureau had safeguarded the interest of the Government by careful inspection and supervision. This method of contracting, while not the most economical perhaps, was necessary to secure the early completion of the buildings to house and provide hospitals and other accommodations for the recruits. There has been no question of the good faith and integrity with which operations were carried out.

In the construction of the camps the bureau erected 452 buildings under 50 acres of roofing, requiring millions of feet of lumber. An interesting statement of these operations will be found in the hearing of Admiral Harris.

This bureau met in the course of its construction work the usual difficulties with labor, transportation, and priorities, but these situations were well handled and good results with remarkable dispatch were obtained.

Admiral Harris resigned his post as chief of the bureau to go to the Shipping Board in the fall of last year, and pending the appointment and qualification of his successor, the affairs of the bureau were conducted in a most satisfactory manner by Capt. A. L. Parsons, his former senior aide, as acting chief.

AIRCRAFT.

We have examined the naval aircraft situation and find many matters of great interest, but much of our information is not now open for public discussion.

This was the one development of material which no amount of foresight would have enabled the Navy to prepare adequately. The growth of airplanes and hydroplanes has been so rapid that nothing short of actual war conditions would insure a large number of up-to-the-second machines with aviators trained to handle them.

In the earlier stages of its undertaking the naval air service met many discouragements, but the perfection of the Liberty motor and the use of large sums of money in conjunction with the Army to finance manufacturers have, under the direction of the

air service, produced results that, nor promise to meet the requirements of this important branch of the Navy.

The aircraft program is in charge of Capt. Noble E. Irwin, and we commend to the entire committee the careful reading of his hearing, and especially a recent interesting and informing report made by him, now on file with the secretary of the committee.

TARGET PRACTICE.

The statement of Capt. Charles P. Plunkett, Chief of the Division of Target Practice, is of intense interest, and we invite the committee's special attention to it.

We can not publish all that has been accomplished in the way of naval gunfire, battle ranges, percentages of hits, and the results of a comparison of our Navy gunnery with that of other countries. But to our committee, though not technically trained in this matter, the work of this division has been highly satisfactory.

It betrays no secret to say that the gunnery of the Atlantic Fleet prior to the declaration of war was more than satisfactory, but it became necessary to take a large number of ordnance officers and expert gunners from the secondary batteries and turrets of the fleet, in order to provide armed guards for merchant ships and to furnish ordnance officers for the many new vessels coming into commission, so that many men handling the secondary batteries (many used for torpedo defense) were removed and the heavier batteries thus temporarily lost many of their most highly trained gunners. It was necessary to train new personnel to fill these vacancies, and also to provide for the vessels in reserve and the new vessels coming into service. While, primarily, these were questions for the Bureau of Navigation, yet they caused, as Capt. Plunkett explained, the deepest anxiety to the gunnery officers. Nothing but the carefully developed system in the Navy, coupled with devotion of the officers of the fleet and the enthusiasm and intelligence of the enlisted personnel, saved the situation. How well the men sent to the merchant ships have been able to do their work has already answered the defenses they have made to submarine attacks. How well the new men have responded to their training can not be answered until "the day" when the guns of the fleet speak, but we venture to prophesy that the results will be in keeping with the proved traditions of the American Navy.

THE MARINE CORPS.

The Marine Corps, though inherently a part of the Naval Establishment, has its own separate and distinct organization with separate military and administrative staff departments, the latter of which includes a separate supply bureau, the quartermaster's department. It has also its own paymaster's department.

The committee was much impressed with the keen, personal, active interest shown by Gen. George B. Barnett, commander of this corps, together with the officers under him, in everything pertaining to the welfare, comfort, and advancement of the enlisted personnel. This individual interest on the part of the officers is a very large contributing factor, we believe, to the well-known high efficiency and splendid spirit and morale of this corps.

About a year and a half ago Congress began to increase the strength of the Marine Corps, which consisted then of 344 officers and 9,921 enlisted men. By legislation approved August 29, 1916, authority was granted to increase it ultimately to 693 officers and 17,400 enlisted men. Later, after war was declared, a further temporary increase was authorized on May 22, 1917, for the duration of the war, permitting enlistments to a strength of 30,000 enlisted men (exclusive of reservists) and allowing 1,197 officers. About a year after this first legislative authority was granted, the actual strength of the Marine Corps, including reservists and National Naval Volunteers, was 32,288 enlisted men and 1,120 officers. Thus it will be seen that the Marine Corps more than trebled its former strength in officers and enlisted men within this comparatively short period. To-day the Marine Corps numbers 1,230 officers and 36,334 enlisted men.

The actual enlistment was accomplished through the usual methods of recruiting from amongst volunteers from civil life at a time when the Army, Navy, and National Guard organizations were all working in the same field with the same object of filling up their authorized quotas. As new men came into the corps, clothing, equipment, and military stores had to be provided and immediate and adequate methods taken for their health, their instruction, and training. The satisfactory accomplishment of this task required teamwork on the part of officers in command and the military and administrative staff departments. The prewar methods of the Marine Corps in recruiting, training, and administering to the needs of the corps were adapted at once to the situation incident to this increase.

We find that, besides taking care of new appointments in the commissioned grades and the enlistments and the training of this additional force, the Marine Corps has attended without a hitch to its ordinary and regular duties of guarding the navy yards and naval stations, both in and outside of the United States. It has furnished expeditionary forces for duty in France and elsewhere outside the United States and supplied marine detachments for all battleships, cruisers, and other naval vessels placed in commission during existing hostilities.

At the same time it has kept a force of officers and men in Haiti and Santo Domingo to insure continued good order against certain insurrectionary elements amongst their inhabitants. We mention one instance to show the efficiency of the Marine Corps' method of training raw personnel. The rifle is the weapon of the marine. When the Marine Corps was, roughly, 10,000 enlisted men before the war, 6,118 of that force were rated as so efficient in the use of this weapon that they were under the law entitled to an increased pay. To-day the Marine Corps of 36,334 enlisted men has 22,577 men similarly rated. This shows that it has actually increased its prewar percentage of proficient marksmen.

It has been the established policy of the Marine Corps in prewar times to fill its commissioned personnel, as far as possible, by promotions from the ranks, and no appointments are made in commissioned grades direct from civil life. We most heartily approve this policy as rewarding the tried and true amongst the enlisted force.

All of the emergencies the corps has been called upon to meet have been met by the officers and enlisted men in the most expeditious and efficient manner, without either friction or confusion. These results not only vindicate the system of organization but also reflect credit upon those officers who are responsible for the maintenance, direction, and efficiency of the corps.

There are to-day on the firing lines in France no better trained, no braver, no more effective fighting force than our own marines now serving there, and we hope their number may soon be largely increased. Both officers and men are anxious to go. Thoroughly equipped and splendidly trained, as they are, in the arduous methods of modern warfare, we feel that theirs will be a service of results which the Nation will always remember with ever-increasing pride.

OFFICE OF NAVAL OPERATIONS.

Thus far in our report we have considered the operations of what may be termed the administrative side of the department, including the great bureaus. There remains to be considered the more strictly military administration of the Navy.

In 1915 Congress, on the recommendation of the Naval Committee, created the Office of Naval Operations, not defining the duties of the chief, but placing upon him responsibility for the maintenance of the fleet and for the preparation of plans for its use in the war. The Secretary of the Navy appointed Capt. William S. Benson, Chief of Operations and assigned five officers to assist him. Capt. Volney O. Chase was senior aid for personnel and Capt. Josiah McKean for material. The Secretary promulgated a new set of naval regulations, fixing the authority of the Office of Operations and its relations to the bureaus of the department. Congress by subsequent legislation provided for the assignment of a larger number of officers to duty in the Office of Naval Operations, and further, that orders issued by the Chief of Operations in the name of the Secretary should have the same authority as if issued by the Secretary himself. This office has thus become the factor for the coordination of effort between the bureaus, and in military matters of the Navy it has become the dominant authority.

If the Atlantic Fleet was ready for action on April 7, there is no question that its preparedness in both material and personnel was in great measure due to the directing force of the Office of Operations, and further, that plans for the mobilization of the fleet were ready for immediate use. The support given by the department to Vice Admiral Sims goes by way of the Office of Naval Operations. The support of the Atlantic Fleet goes by way of Naval Operations, and in all military matters pertaining to the Navy it is this office which, under the Secretary, gives the final direction.

The pronounced success of this office beyond question is due to the strong personality of its chief, Admiral Benson, the ranking officer of the Navy.

Except the general statement that Vice Admiral Sims has had everything called for as promptly as it could be delivered, our committee has nothing to report about the condition of our overseas fleet. Its splendid work under the able direction of Admiral Sims will be told in detail at some later time.

We have learned by personal observation as well as by inquiry something of the Atlantic Fleet, and we feel we can say that the condition of ships and personnel, all things considered, is more than satisfactory. That this condition exists is due to Admiral Mayo, its commander in chief, and every officer and man under him.

When war came, On April 7, Admiral Mayo is quoted to have said, "I did not give a single solitary order of any kind or description to pass the fleet from a peace to a war. Then came the disintegration of that excellent, but too small, personnel to meet the necessities of expansion."

The task of reconstructing and training it has been difficult, but we learn that officers and men have devoted themselves to this task with patience, endurance, pluck, and skill of the highest order. So well have they succeeded that we feel justified to report, "Sirs, all is well with the fleet."

Committee.

MARCH 11, 1918.

HOUSE COMMITTEE PERSONALLY INVESTIGATED UNITED STATES NAVAL ACTIVITIES IN EUROPE.

In the summer of 1918 the House Naval Affairs Committee, in order to know at first hand more particularly the Navy's contribution overseas and be able to legislate wisely for its fullest efficiency and expansion, visited the naval bases abroad and came in touch with responsible naval officers assigned to duty in European waters. Upon their return, in submitting their report, dated November 12, 1918, the chairman of the committee announced the conclusion of the committee's personal investigation and personal knowledge, obtained after visits and after conferences with Admiral Sims in London, Admiral Wilson in France, and all other naval officers in responsible positions abroad. This is the report they made after visiting all the naval bases in Europe—that is, this subcommittee of the House Naval Affairs Committee, as I say—when they returned in the summer of 1918. Their findings were summed up in these words:

The record made by the United States Navy in this war has not only justified the pride of the American people but has challenged the admiration of the world. Called upon to perform tremendous tasks, some of them seeming almost impossible, in not one instance has it failed.

The full report is as follows—

The CHAIRMAN. That is also in your annual report?

Secretary DANIELS. Yes. I will not read it. It is a very detailed account, telling of going to the various air stations and bases in Italy, Ireland, and France—everywhere the Navy was. That is signed by the chairman of the Naval Affairs Committee, Mr. Padgett.

The report submitted is as follows:

VISIT OF HOUSE NAVAL COMMITTEE TO EUROPEAN NAVAL BASES.

COMMITTEE ON NAVAL AFFAIRS,
HOUSE OF REPRESENTATIVES,
Washington, D. C., November 12, 1918.

Hon. JOSEPHUS DANIELS,
Secretary of the Navy, Washington, D. C.

DEAR MR. SECRETARY: I deem it appropriate to submit to you a succinct statement of the visit overseas of a subcommittee of the Committee on Naval Affairs of the House of Representatives. The subcommittee consisted of the following members: Lemuel P. Padgett, chairman; Daniel J. Riordan, Walter L. Hensley, John R. Connelly, William B. Oliver, William W. Venable, James C. Wilson, Thomas S. Butler, William J. Browning, John R. Farr, Sydney E. Mudd, John A. Peters, and Frederick C. Hicks.

The committee left Washington on the afternoon of July 13 and boarded the U. S. battleship *Arkansas* July 14, leaving that afternoon, and arrived in the Scapa Flow, in the Orkney Islands, north of Scotland, on the morning of July 25. Capt. William H. G. Bullard, now Admiral Bullard, was in command and the members of the committee were well pleased with the fine conditions and splendid discipline aboard the ship. We found the ship clean and healthy, the men well fed and happy and full of zeal and energy. We had opportunity during the voyage to have a good insight into the life and discipline and association of the officers and men aboard the ship, and we were much gratified at the cordial relations and good discipline maintained.

When we anchored, Capt. Guy Gaunt, of the Royal Navy, came aboard and informed us that he was detailed by the first lord of the Admiralty to receive us and to assure us that we were to be the guests of the Government so long as we were within their domains. Capt. Gaunt remained with the committee until our departure for France, and we wish to acknowledge the generous and distinguished courtesies extended to us on behalf of the British Government during our visit in Scotland, England, and Ireland, and we wish to express our appreciation of the many kindnesses and courtesies as well as the great efficiency of Capt. Gaunt.

We also wish to express our appreciation of the distinguished consideration and courtesies of Sir Fric Geddes, First Lord of the British Admiralty.

At all places we visited in Scotland, England, and Ireland, every opportunity was afforded us to secure the fullest information.

While in London we were received very graciously by their Majesties King George and Queen Mary and Princess Mary; and in Ireland we were received by Gen. Lord French, Governor General of Ireland.

The committee visited Scotland, England, Ireland, France, and Italy. The committee first inspected the mine plant at Inverness, on the North Sea, under command of Admiral Strauss. At Invergordon, about 20 miles distant from Inverness, there was also a large mine plant under the command of Admiral Strauss. Here we had opportunity to get a comprehensive view of the great work that was being accomplished by the United States Navy in planting the mine barrage from the Orkney Islands to the south coast of Norway, a distance of 235 miles, and requiring something like 80,000 mines to close that passage of the North Sea against German submarine activities. We found a splendid spirit of enthusiasm with the officers and men in this work, and were much pleased with the fine progress they were making. It was an undertaking requiring great skill, care, and knowledge; and the way in which it was accomplished reflected credit upon the officers and men of the Navy.

The committee next visited Strathpeffer, where the Navy was establishing and equipping a splendid hospital service under the direction of Drs. Bogart and Smith, to be prepared properly to care for the sick and wounded of the Navy in case of naval engagements in the North Sea or in the waters on the west coast of Scotland, the place being accessible from both places. Next we visited the hospital at Leith, known as Seafield Hospital, near Edinburgh. These two hospitals we found were being fitted up for a capacity of 1,000 to 1,200 beds in case of necessity, with adequate complements of physicians, surgeons, and trained nurses. The committee was gratified to find here as elsewhere a splendid spirit of activity and devotion.

Under reciprocal arrangements between the two Governments these hospitals were caring for the sick and wounded of the navies of Great Britain and the United States.

While at Edinburgh, the committee availed itself of the opportunity of visiting and having a review of the British Grand Fleet, which was then at anchor in the Firth of Forth. It was indeed a grand and magnificent fleet, worthy of its history and its reputation. At that time, the United States Navy had five battleships cooperating with and forming a part of the Grand Fleet under the command of Rear Admiral Hugh Rodman; and it is a pleasure to bear testimony that the American ships in every respect bore themselves proudly in comparison with the English ships.

One of the large enterprises being constructed in Scotland was the oil pipe-line across Scotland from west to east for the conveying of the oil for the use of naval ships and saving many hundreds of miles of steaming to go around Scotland through the sea areas infested with German submarines and thereby avoiding great dangers of the loss of valuable ships and cargoes of oils. This was a great undertaking and was being successfully constructed during our visit.

The committee was delighted to find a splendid spirit of cordial and hearty cooperation between the two navies and, as expressed by Admiral Rodman, it was not two services of two countries, but was one service of two countries, so complete was the cooperation and good feeling between the two navies.

At the same time the committee inspected, at the invitation of the British officers, the British Navy ambulance-train service. Railroad trains were specially fitted

and equipped for the transportation overland from the ship to the hospitals of the sick and wounded, and arranged for the ease and comfort of the sick and wounded, giving evidence of the solicitude and care for the well-being of the officers and men in the naval service.

July 28 the committee arrived in London and that night attended exercises at one of the principal theaters of the town for the special benefit of the enlisted men of the armies and navies of the United States and the allied countries. These exercises were held every Sunday evening and were free, and were participated in by the leading actors and actresses of the various countries and were intended for the entertainment of the enlisted men. It was indeed a splendid sight to see 4,000 or 5,000 young men in uniform enjoying the fine entertainment thus provided for them.

In London it was specially a privilege and a pleasure for the committee to receive the many kind attentions and courtesies of Vice Admiral William S. Sims and the other officers of the United States Navy associated with him in the work in London.

The members of the committee had several conferences with Vice Admiral Sims and the other naval officers relative to conditions, the needs of the service, and the general situation, and the committee was gratified and pleased with the efficiency and the comprehensive and at the same time minute and particular way in which Vice Admiral Sims and the corps of officers associated with him were handling the naval situation.

July 30 the committee visited the English naval base at Dover under the command of Vice Admiral Keyes and were received by the admiral with becoming courtesy and given every opportunity to visit and inspect the large activities at this important English naval base, and the committee was well pleased with the conditions and the activities. Dover was one of the important English naval stations, especially for the smaller craft and was the control base from which operations against the North Sea German submarine activities were conducted. It will be recalled with pleasure that Vice Admiral Keyes rendered very daring and distinguished service in the attacks upon the German bases at Ostend and Zeebrugge, and during our visit the admiral gave us exhibitions of some of the new accomplishments and achievements of the Navy in its war activities, which were of interest and instructive.

July 31 the committee visited the English aviation base, the assembling and testing plant at Hendon, near London, and were afforded every opportunity to witness the aviation activities which are being conducted at this base; also visited another aviation base near Hendon, and at both places made inquiry as to the Liberty motor, and received very satisfactory comments upon its efficiency.

August 1 members of the committee visited Eagle Hut Y. M. C. A. and were delighted with the splendid care and provision made for the comfort and well-being of the enlisted men, and the provision that was being made for their eating and lodging at a very low cost, furnishing clean beds at a cost of 25 cents per night, and a breakfast for 16 cents, or a meal for 25 cents. The members of the committee appreciated the courtesy and kindness of Ambassador Page, and had the pleasure of lunching with him August 1, and in the evening of the same day were the guests at dinner of the House of Commons in the Parliament House, at which the Speaker of the House of Commons presided and many of the distinguished men of the English Government were present.

August 2 members of the committee visited the rehabilitation hospital at Roehampton, near London, and were more than delighted with the magnificent work, even marvelous work, being done by the English Government for the rehabilitation of its wounded men, not only furnishing artificial limbs, which were wonderful in their help to the men, but teaching them all kinds of trades, vocations, and occupations adapted to their particular conditions and fitting them for useful service after the war. The results accomplished in the way of furnishing artificial limbs and also in qualifying the men for useful and self-supporting service in their crippled condition were most gratifying, and the members of the committee would be happy to have the Government of the United States spare no pains to use its best endeavors to care for its wounded and disabled soldiers and sailors to fit and qualify them for the useful and active duties through life. The members of the committee had conferences with Sir Eric Geddes, first lord of the Admiralty, and also with Mr. Lloyd-George, the premier, in which opportunity was afforded for a discussion of the war conditions as related not alone to the Navy but to the general conditions of the war and to some of the important conditions after the war. The committee also visited the English naval station at Harwich, under the command of Col. C. R. Samson, and were shown every courtesy and opportunity for inspecting and witnessing the aviation activities at this station, and Col. Samson also bore hearty commendations of the Liberty motor and made useful suggestions relative to flying machines. The members of the committee visited Queenstown, Ireland, where the United States had established and was operat-

ing a large destroyer base and near by an aviation base, at that time under command of Admiral Bayly, of the English Navy. The members of the committee were courteously received and had the opportunity of visiting and inspecting all of the United States activities with reference to destroyers and other small craft, the aviation activities, and also the large hospital activities established near Queenstown.

The members of the committee were pleased with the efficiency and the activity of the officers and the men of the United States Navy at Queenstown and the hospital and the aviation base near there. These activities in the aggregate were very large and comprehensive and were very important, caring for and protecting very important shipping areas. At night the committee attended an entertainment given by the enlisted men of the United States Navy and attended by a thousand or fifteen hundred enlisted men. The high character of this entertainment was a distinguished credit and bore evidence of the high character of the enlisted personnel of the Navy, and the officers and men of the Navy in the activities at Queenstown and the surrounding places merit commendation.

The committee arrived at Paris August 9 and were received very courteously and extended many kindnesses by Ambassador Sharp and the officers of the United States Navy on duty there. The committee was also very courteously received by Mr. Leygues, minister of marine; Admiral de Bon, chief of operations; Premier Clemenceau; Mr. Pichon, minister for foreign affairs; and President Poincaré.

The members of the committee visited the battle fields of Verdun, Chateau Thierry, and Belleau Wood, and saw the horrible destruction and devastation which had been wrought. We also visited the camp of the marines at Marboche, 15 miles north of Nancy, and St. Genevieve. The headquarters of the Twenty-third United States Infantry, Col. Malone commanding, St. Genevieve, is about a mile and a half from Pont-a-Mousson, which has become famous of late.

I wish to state a fact made known to me by the officers in command, which has not been heretofore generally published, but which is a wonderful testimonial to the heroic courage and dauntless bravery of the marines. In the Battle of Belleau Wood there were about 8,000 marines engaged, and there were 5,720 casualties. Many of these were not serious, but it tells a tale of the horrors which the marines had to face in capturing the place.

The members of the committee did themselves the honor of visiting Gen. Pershing at Chaumont and paying their respects, and had the opportunity of conferring with him relative to war conditions and were pleased to receive his unreserved praise and commendation of the American officers and soldiers. We saw where many villages had been completely destroyed and many others almost totally wrecked.

The committee left for Rome August 16, arriving at noon August 18, and were received with very great courtesy by the Italian Government, having been made guests of the Government from the time we reached the Italian frontier.

The committee visited and paid its respects to Vice Admiral del Bono, minister of marine; Prime Minister Orlando, minister of foreign affairs; and Baron Sonino, all of whom very courteously received and extended to the members of the committee distinguished courtesies.

August 20 the committee visited Venice under the command of Vice Admiral Paolo Marzolo, and were given opportunity to visit and inspect the naval base and to see the naval activities being conducted by the Italians at this point. This base was for small naval craft, and the committee had opportunity to see some of the small craft which the Italians developed, and especially the little boat used by the daring naval officer who attacked and sank one of the Austrian battleships and disabled a second one.

Tuesday night, August 20, King Victor Emanuel entertained the committee at dinner near Padua, near the front, and the next morning the committee witnessed a review by the King and Gen. Diaz and other Italian officers of 20,000 shock troops, and the committee were well pleased with the splendid review and the fine military appearance of the troops. The committee also visited the front at Asiago and near Monte Grappa and had opportunity to visit the trenches at this point, through the courtesy of Gen. Montuori, the general in command of the Italian sector, and Gen. Lord Cavan, in command of the British sector.

We had the pleasure of meeting, and wish to acknowledge the courtesy of, Gen. Treat, in command of the United States Army in Italy, and also to express our appreciation of the courtesies extended to us by the United States naval officers in Italy and to bear testimony to their capable and efficient management and conduct of affairs.

While we did not have opportunity in Italy to see large naval activities and operations, yet the members of the committee feel that in many respects the visit of the committee to Italy was one of the most helpful and beneficial of its many activities.

Returning to Paris, the committee visited and inspected the United States naval activities at Bordeaux, Moutchic, Paulliac, Rochefort, La Rochelle, La Pallice, Fro-

mentine, Paimboeuf, St. Nazaire, Montoir, Le Croisic, L'Orient, Ile Tudy, and Brest. All of these stations located on the west coast of France were visited and inspected by the members of the committee.

In a report of the character intended for this one it is impossible even to attempt to describe in detail the activities of the Army and the Navy. The amount of money expended at these various stations mounts into the hundreds of millions of dollars and the activities involve the employment of thousands upon thousands of men. They represent activities on land and water, under the water, and in the air. They involve transportation of troops, munitions, equipment, food, and clothing from the United States into France of the value of untold millions. The activities of the Navy were to escort and convoy ships transporting troops and all manner of effort and activities in the air, patrolling the seas against German submarines, and safeguarding the arrival and the departure of ships, the construction of bases for the operation and the care of the enormous aviation activities, and also at the various places providing first aid and hospital accommodations for the sick and disabled and the establishment of sanitary conditions, housing facilities, and numerous other activities essential to the proper care of the men, the repair of ships, and the numerous other efforts essential to the successful prosecution of the war.

We can not attempt to go into detail in explanation or elucidation of these varied and stupendous activities. Suffice it to say that we attempted to see and as best we could to inspect and to survey these colossal operations and all we can do is to join in what was said to us in England, France, and Italy, one unbroken expression of wonder and amazement at the magnitude and the rapidity of the achievements and accomplishments of the United States in its war efforts.

The whole work and effort was so great and colossal that while there may have been mistakes and matters subject to criticism in small details they were lost in the magnitude and the success accomplished.

The aviation work of the Navy was under the command of Capt. Cone, and it is simple justice to him to express the conviction of the members of the committee that he was handling the matters in a most admirable and commendable way and deserves commendation for his capable and efficient management of so large an enterprise; and the officers and men associated with and working under him each in his station and the discharge of the duties assigned him we found were active, energetic, and capable and are worthy of commendation, not alone for their zeal but for their successful work. They are too numerous to attempt to mention.

Capt. Jackson was detailed by Vice Admiral Sims to accompany the committee in France and Paymaster Higgins was detailed to accompany the committee in all of its travels, and to both of these officers an expression of appreciation for their courtesies is a pleasure to give.

Rear Admiral Henry B. Wilson, with headquarters at Brest, in charge of naval operations in France, was most considerate and courteous to the members of the committee. We found him to have the matters well in hand and to be a most capable and efficient officer and deserving of commendation for his splendid management.

Vice Admiral William S. Sims, in command of all of the naval activities overseas, we found most capable and efficient, having the confidence and the cordial good wishes of the United States naval officers and of the officers of the British and French navies.

As indicated above, in the stupendous operations of the Navy there may have been, and doubtless were, minor matters of detail which may have been subject to improvement or criticism, but taken as a whole, by and large, the Navy has accomplished a great work and is entitled to approval and commendation.

The chairman and a number of the members of the committee returned upon the transport *George Washington*, under the command of Capt. Pollock, United States Navy, who had successfully made a number of trips across the Atlantic, transporting troops and freight to France.

We were glad to note the same splendid condition of cleanliness of ship, care of men, and discipline aboard the transport under the management and operation of the Navy as we had found upon the regular ships of the Navy.

We wish to express our commendation of the good service and management of Capt. Pollock and the officers of the Navy associated with him upon the ship.

Respectfully submitted.

L. P. PADGETT, *Chairman*.

In an address in the House of Representatives after his return, Chairman Padgett said:

Mr. Speaker, the record made by the United States Navy in this war has not only justified the pride of the American people but has challenged the admiration of the

world. Called upon to perform tremendous tasks, some of them seeming almost impossible, in not one instance has it failed. Whenever any call has come and we asked "When will you be ready?" as did the British admiral when the first destroyers arrived in European waters, the answer has been, "We are ready now." Ready to face any emergency, ready to cope with any problem with that supreme courage and unflinching efficiency that is the tradition of the service.

The readiness of the Navy for action when the war call came was no surprise to us who were familiar with its workings, the plans that had been made, and the measures that had been taken to prepare for any eventuality. We knew that the organization was sound from keel to topmast, that the men at the helm were worthy of every trust. We knew they had been bending their energies to prepare every branch of the Navy for active service.

* * * * *

Recently, in company with 12 other members of the Committee on Naval Affairs, I made a visit overseas, going into Scotland, England, Ireland, France, and Italy, where we had opportunity to visit and make inspection of some of the activities of the English Navy and of many of the activities of the United States Navy abroad.

I do not deem it appropriate or advisable because of war conditions to speak in detail of these activities in the war zone in more specific terms than I have set out herein. However, I do deem it appropriate to say that we found the operations of the United States Navy overseas in a most satisfactory condition. We were especially pleased to learn from our own officers, as well as the officers of the English, French, and Italian Navies, that the cooperation between the several navies was most complete, cordial, and harmonious; indeed, they all spoke of it as the one naval service of the three countries and not as three separate naval services. We were also well pleased with the intelligent and efficient management and with the zeal, energy, and devotion of our officers.

No statement can be made at this time in detail of the magnitude of the naval operations overseas. This much, however, I feel justified in saying: That the magnitude of naval operations overseas, on the water and in the air, reflects credit upon the American people and commands the respect and the admiration of our allies. When the war is over and the full history of the magnitude of our naval operations abroad may be given in detail, it will be a source of pride and honor to the American people; and the fidelity, intelligence, patriotism, and devotion of our naval officers and enlisted men, embracing as a part of the Navy the Marine Corps officers and men, will form a bright part in the world's history and will receive throughout future ages the commendation and plaudits of all who admire courage and intelligence and love patriotism and fidelity.

The marines on land and the Navy men on sea and in the air in the various lines of work and duty to which they have been detailed deserve, and I believe heartily receive, the unanimous commendation of the American people. Well done, faithful officers and men.

GREAT PUBLIC ALARM WHEN GERMAN SUBMARINES APPEARED OFF OUR COAST.

In the early summer of 1918 German submarines appeared off the coasts of the United States and sank 52 vessels. This destruction created consternation among many people. Demands were made upon the Navy Department through the press and otherwise to do two things: (1) Recall destroyers from European waters to protect our own coast which was endangered; and (2) discontinue sending American troops abroad until assured they would not be attacked by German submarines on this side of the Atlantic.

Memory of past fears grows dim after the danger is over. In 1918, when the German submarines appeared off our coast there was real consternation which made itself felt in criticism of the Navy's refusal to recall its destroyers, and of the Army and Navy for continuing to send its troop-laden transports to Europe. The Navy Department was not then, or at any time, influenced by any consideration except its duty to throw the whole weight of its power against the enemy. It was, therefore, unmoved by the criticism, the appeals and the

threats. In Congress itself there was a widespread feeling that the military departments of the Government were pursuing the unwise course, and endangering the lives of American soldiers. The administration gave anxious thought and consideration to its duty.

SENATORS LODGE AND SWANSON INVESTIGATED THE SITUATION.

The Secretary of the Navy then, as always from the beginning of the war, was in close touch with the leading members of the Naval Affairs Committee, and every move and action and policy of the Navy was open to their inspection and knowledge and their counsel and advice eagerly welcomed. When the criticism was at its height, Senator Swanson, chairman of the Senate Naval Affairs Committee, and Senator Lodge, the ranking member of that committee, were invited to the Navy Department for conference. They accepted the invitation. Everything was open to them. On June 6 Senator Lodge, the ranking Republican member of the Naval Affairs Committee, in an address in the Senate, told his fellow Senators that the Navy Department had anticipated the attack, that "they have tried to make every preparation to meet it," and Senator Lodge observed, "I think they have." Senator Lodge added that he had visited the Navy Department and he gave it as his opinion that "after having examined all the arrangements with the utmost care of which I was capable and with the most intense interest and give my word for what it is worth, that in my judgment, the Navy and the Navy Department, the Secretary and Assistant Secretary, and all the officers, the Chief of Staff—referring to Admiral Benson—and every head of bureau has done everything that human foresight could suggest."

PUBLIC CRITICISMS PRESENTED IN THE SENATE.

The address of Senator Lodge was made in answer to a statement by Senator Brandegee based upon an editorial in the Philadelphia Public Ledger, regarding the appearance of submarines off our coast which the Senator caused to be read in the Senate on June 6, 1918. Senator Brandegee prefaced the reading of the editorial with the statement: "Inasmuch as I believe that the questions raised in the article are in the minds of many people in the country to-day, I hope, if not incompatible with the public interest, the Navy Department may issue such information as may be properly given out in relation to the matter." The following is the editorial, which appeared in the Public Ledger June 5, 1918, alluded to by Senator Brandegee:

WHAT WARNINGS, WHAT DEFENSE?

Where was the powerful American submarine scout and destroyer fleet during the last 10 days of May and the first 3 days of June, while the U-boats were giving chase to American merchantmen, shelling, bombing, and torpedoing them? How could the skipper of the *Bristol*, when warned by the captain of the *Cole* that German under-sea raiders were working along the coast, declare as late as Sunday last that to his knowledge the Government had flashed no wireless warning? Were the authorities at Washington incredulous of the stories of pursuits, captures, and sinkings constantly being brought in by captains and crews? And was our vigilant Navy at all cognizant of the presence of the supersubmarines?

Eight days have elapsed since the Public Ledger printed the story of the three-master *Edna*, found off the mouth of Chesapeake Bay with a gaping hole blown below her water line, and two other large schooners in like conditions near by. Immediately afterwards stories were published about a German submarine sighted off the Delaware Capes, giving chase to a steamship that escaped her. A full fortnight ago the captain of the British tanker *Cheyenne* told of his escape from a U-boat attack 180 miles at sea, when he took refuge at the naval base at Lewes, on the Delaware shore. The *Cheyenne's* captain exclaimed at the incredulity of the naval authorities to whom he and his officers told the story. The *Edna* was attacked on May 25; its commander, later made prisoner on the U-boat which sunk his schooner, beheld the capture of the *Winnieconne* and the *Isabel Wiley*. There were the experiences, also, of the crew of the *Hattie L. Dunn*, sunk on May 25, and of the crews of two other schooners and a tanker that had been picked up adrift by an American steamship.

Wireless distress calls were sent out from the ships sunk by U-boats at least 10 days previous to the official Government warnings that closed the Atlantic ports. Why were not these warnings issued earlier. Where were the flotillas of destroyers and chasers, to the building of which the Nation has devoted hundreds of millions of dollars? If they were active, the commanders of American merchant shipping subject to attack seem not to have known about it. The U-boats got their prey. Passenger steamships and freighters appear to have put to sea without restraint and without knowledge given of the presence of the raiders. The failure to take quick and sharp naval measures is mysterious, puzzling, to the lay mind. Is there a proper explanation? Or is this one more case added to the piled-up enormities of bureaucratic stupidity during this war?

The disappearance of the *Cyclops* should have sufficed to get our coast patrol in action.

SENATOR LODGE COMMENDED ACTION OF NAVY DEPARTMENT.

Closing a debate in the Senate, following the reading of the above editorial criticism of the conduct of the war, written without knowledge of how the Navy Department had done and that it was doing everything possible to destroy submarines overseas, and to protect our own coast, Senator Lodge said in part:

The Navy and the Navy Department have taken every precaution that human foresight could suggest, so far as I am able to judge, and I have examined their precautions with such intelligence and care as I could give to the matter.

* * * * *

Mr. President, the Navy and the Navy Department have necessarily anticipated a submarine attack from the very beginning of the war. They have had it constantly on their minds. They have tried to make every preparation to meet it. I think they have. It would be most injurious for me to stand here and follow down the map of the coast and tell the Senate and the public exactly what those preparations are—tell them where the submarine chasers are, where the destroyers are, where the signal stations are, what arrangements they have made for meeting the danger when it came, as they were sure it would come. No human mind can possibly tell when out of the great waste of waters of the Atlantic Ocean a submarine, which travels by night and submerges by day, will appear. As soon as the Navy had any authentic news to indicate the presence of submarines on this coast they acted. They will do everything that can be done. They have the means to do it. That is all that I feel at liberty to say in a general way.

Mr. President, for four years the greatest Navy in the world has been devoting its strength to the destruction of German submarines. They were operating in what are known as the narrow seas, where the commerce of the world, we may say, comes together in a closely restricted area; and even there, with the knowledge for years of the presence of the German submarines, it is not going too far to say that many of these submarines escaped them. They are diminishing now, without assistance. A larger control is being established over the narrow seas, and the work against the submarines at the point of the greatest danger—what we may call the naval front of this war—is succeeding more than any of us dared to hope. It is done by the multiplication of vessels and the multiplication of methods, and there is the great center of the fight.

One or two submarines have appeared suddenly on our coast, as was to be anticipated. In my judgment, we are doing all that can be done. I have taken the pains to go to the department, where everything has been laid before the members of the Naval Affairs Committee who cared to investigate the subject, and I am entirely satisfied that they are doing everything that is possible. But the chase of the submarine is something like searching for the needle in the haystack. You can not tell in which particular wisp of hay it will come to the surface; but that the defense will be effective I have no sort of question.

* * * * *

We have a patrol along the coast, which is composed chiefly of what is known as the Life-Saving Service, or the Coast Guard, as it is now known. We also have an organized system for procuring information from fishermen and others on the coast, extending from Maine to the Gulf. Those sources of information were organized and in operation through the Navy Department at least two years before we entered the war, so I believe that so far as our own coasts are concerned the chances of a base there are almost negligible.

* * * * *

I did not rise to go into the details to describe to you the different naval districts of the country and what has been done in each one of them, but simply to tell you what my opinion is after having examined all the arrangements with the utmost care of which I was capable and with the most intense interest and give my word for what it is worth, that in my judgment the Navy and the Navy Department, the Secretary and Assistant Secretary, and all the officers, the Chief of Staff, and every head of bureau has done everything that human foresight could suggest.

* * * * *

I want the Senate also to remember that when newspaper editorials ask what the Navy is doing, I should like to have them consider why it is that we have sent all the troops we have sent—and we have sent a great many thousands—why it is that they have gone to Europe without the loss of a transport, thank God, as I do. How is it that that has happened? It has happened because of the American Navy, which furnishes the convoys, and no other cause.

I wish I could go on and tell you what the American Navy has been doing in the narrow seas. I can not. The Navy has remained largely silent about its work and its preparation, and it is one of the best things about it, but it has been doing the greatest possible work everywhere. It has not failed in conveying the troops. It has not failed in its work in the Baltic and the Channel and the coast of France and the Mediterranean, and it will not fail here. It will do everything that courage and intelligence and bravery can possibly do.

As stated in the first paragraph, Mr. Chairman, the American Navy in April, 1917, and in every day of every month while war lasted, as Senator Lodge truly said, did "everything that courage and intelligence and bravery can possibly do," and the record, which no amount of carping criticism and misrepresentation can change, will stand to-day, to-morrow, forever.

(At this point, at 3.20 o'clock p. m., the subcommittee adjourned until to-morrow, Saturday, May 15, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

SATURDAY, MAY 15, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235 Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, Pittman, and Trammell.

The CHAIRMAN. The committee will come to order. Secretary Daniels, will you proceed?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. Perfectly uninformed and wanton statements have been made that the Navy Department lacked war plans and preparations. You have heard the statements and official records submitted to you by Admiral Badger, chairman of the General Board, and other members of that board, and other able officers how unfounded were any such statements. The truth is that from its creation the General Board has been employed with study of naval warfare and preparing for any conditions of war that might arise. That is their business. And they have not neglected it. The chairman and other members of the General Board have told you how absurd is this notion that any man can make perfect plans, put them in a drawer, and years after when war is declared say: "Look in my drawer B, take out plan A," and then go to sleep while his plans are carried out. A general or admiral who should undertake to wage war by any such methods described in military fiction would invite defeat. Plans are always in the making, changing with changed conditions, and their success depends upon wise direction while war is waging and boldness and initiative by the men actually in the fight on land or sea.

Shortly after the Central Powers began the World War I had several conferences with Admiral Dewey, head of the General Board. I was in close touch with the study that the board was making and remaking in view of the European war. I knew that the board was not only making war plans, but that it was also outlining the "preparations necessary to be made by the bureaus and officers of the department to insure a state of preparedness for war." This study and report were forwarded to me on the 13th of March, 1915.

I approved them, and took the steps to put them in operation. Here is the report of the General Board of March 13, 1915:

GENERAL BOARD, DEPARTMENT OF THE NAVY,
Washington, March 13, 1915.

Confidential.

To: Secretary of the Navy.

Subject: Preparation necessary to be made by the bureaus and offices of the Navy Department to insure a state of preparedness for war.

Inclosures: As enumerated in paragraph 2.

The strategic study of war in the Atlantic Ocean, in which the United States is a belligerent, shows that the full naval force of the United States, together with the necessary merchant auxiliaries, must be named, fitted out, and mobilized within two weeks after the Government decides that war is imminent and a mobilization of the naval force is necessary.

Let me say, by way of parenthesis, that Admiral Mayo has testified to you it was not two weeks before one telegram had mobilized our forces.

In order to accomplish this it is necessary that all preparations possible be systematically made during time of peace and this state of preparedness be constantly maintained.

2. The administrative section of the plan for war in the Atlantic gives generally the work to be inaugurated now and diligently prosecuted by the bureaus of the Navy Department to insure a state of preparedness, and there are forwarded herewith copies of that part of the plan that concerns the activities of the following bureaus and offices, naming all the bureaus of the department: Office of Solicitor, Office of Naval Intelligence, Bureau of Ordnance, Bureau of Construction and Repair, Bureau of Steam Engineering, Bureau of Yards and Docks, Bureau of Medicine and Surgery, Bureau of Supplies and Accounts, Bureau of Navigation, headquarters of Marine Corps.

3. The General Board recommends that each office and bureau be furnished with the part of the plan that pertains to its own duties and directed to comply with the requirements of the plan as fast as may be practicable, and especially to be directed to report to the department as soon as practicable not later than one month from the approval of this letter, and thereafter at the end of each calendar quarter, the progress made in the work of preparation and to comment upon any defects in the plan which make its execution impracticable or that seem cumbersome.

4. It is recommended that copies of these reports be forwarded by the department to the General Board for the purpose of keeping the war plans up to date.

GEORGE DEWEY.

Approved:

JOSEPHUS DANIELS, *Secretary of the Navy.*

The man who won the great Battle of Manila was the man I depended upon chiefly, and the country depended upon him just as securely and surely in 1915 as it did at Manila.

To carry out the preparation recommended by the General Board, I sent a confidential letter to the head of every bureau and office similar to the following, which was sent to the Chief of the Bureau of Ordnance. That letter tells them to carry out the General Board's directions. [Reading:]

NAVY DEPARTMENT,
Washington, May 28, 1915.

Confidential.

To: Bureau of Ordnance.

Subject: Preparation necessary to be made by the bureaus and offices of the department to insure a state of preparedness for war.

Inclosure: Copy of General Board letter, dated March 13, 1915, with inclosure.

1. There is forwarded herewith a copy of General Board letter No. 425 (confidential). The recommendations made in paragraphs 3 and 4 were approved May 28, 1915.

2. The part of the plan that pertains to your bureau is transmitted herewith, and you are directed to comply with the requirements of paragraphs 3 and 4 of the General Board's letter.

3. The reports required should be sent to the department (operations).

JOSEPHUS DANIELS.

Every head of bureau and office to the extent of appropriations made by Congress obeyed these directions, and the Navy, therefore, exercised all the foresight and preparedness that was possible before we entered the war. Any statement to the contrary has been shown to be unfounded by the statements of Admirals Badger, Benson, Mayo, Fletcher, Rodman, Wilson, Niblack, Straus, McKean, and Capt. Pratt, officers in the most responsible positions during the war.

PREPAREDNESS BEFORE THE WORLD WAR—CONTRACT IN PREPARATION AND EXPANSION OF THE NAVY UNDER ROOSEVELT, TAFT, AND WILSON FROM 1901 TO SEPTEMBER 1, 1916.

Several witnesses appearing before your committee, having no first-hand knowledge or little connection with the Navy's important part in the World War, have gone back to the administration of the Navy as far as March 13, 1913, in the vain hope of showing that the Navy in the days before the war failed in preparation because the Secretary of the Navy and the Congress of the United States did not follow their advice in 1913 and 1914. This makes it incumbent upon me, in addition to answering the charges made against the Navy in the World War, to show that between March, 1913, and September, 1916, the three and a half years in which this country was not engaged in war, and before the epoch-making bill of 1916, the Navy was increased in personnel, efficiency, and material more than in any similar peace period or any other period in our history.

Senator TRAMMELL. Are you putting an interpolation there?

Secretary DANIELS. Yes.

Senator TRAMMELL. It was not increased more during that period than it was after we entered the war?

Secretary DANIELS. No; I should have said more than in any similar peace period or any other period in our history except after we entered the World War.

When I became Secretary of the Navy I found that under the administration of President Taft, 1908-1912, the Navy fell back, it being stated by the General Board of the Navy, in response to a request from Representative Butler, of the Naval Affairs Committee, how it was that the German Navy obtained its superiority over ours, with that displacement as a basis, "Considering displacement of ships built, the United States advanced from third to second place in 1907, and dropped to third in 1911," and further, that, "Considering ships built and building, the United States advanced from third to second place in 1909, held this place for a short time only, and dropped to third place again in the same year, 1909."

The basis of ships built and building is a more accurate index to naval strength than the basis of ships built only, for, as the case at point illustrates, a nation can be superior to another, and by building little while the other nation builds much, lose its superiority in a very short time. And on the basis of ships built and building, we

held second place "for only a short time and dropped to third place again in the same year, 1909," four years before the beginning of the Wilson administration.

During President Roosevelt's four years, 1904-8, when the world began to build dreadnaughts, the United States authorized 6 capital ships, the German program authorized 13, including battle cruisers; leaving us a deficiency of 7. In President Taft's first two years we authorized four capital ships, the German program authorized seven, leaving us a deficiency of three. Taking the six years together we authorized 10 capital ships to Germany's 20. This does not show under the administrations of Presidents Roosevelt and Taft any determination to build a Navy superior to Germany's.

In those six years the general board of the Navy had in mind the construction of a navy superior to Germany's, and it recommended the construction of 20 battleships, the same number that Germany authorized. We authorized 10. The general board was certainly not the author of the program adopted. Who was?

The answer is found in part in the annual messages of President Roosevelt to Congress in 1905 and 1906. In his message of December 3, 1906, he recommended this:

I do not ask that we continue to increase our Navy. I ask merely that it be maintained at its present strength * * *. This can be done by a well-settled program of providing for the building each year of at least one first-class battleship equal in size and speed to any that any nation is at the same time building; the armament presumably to consist of as large a number as possible of very heavy guns of one caliber, together with smaller guns to repel torpedo attack; while there should be heavy armor, turbine engines, and in short, every modern device. Of course, from time to time, cruisers, torpedo-boat destroyers, and torpedo boats will have to be built also.

Bear this in mind:

All this, be it remembered, would not increase our Navy, but would merely keep it at its present strength.

In his annual message of December 5, 1905, President Roosevelt had this to say:

It does not seem to me necessary, however, that the Navy should—at least in the immediate future—be increased beyond the present number of units. What is now clearly necessary is to substitute efficient for insufficient units as the latter become worn out or as it becomes apparent that they are useless. Probably the result would be obtained by adding a single battleship to our Navy each year, the superseded or outworn vessel being laid up or broken up as they are thus replaced.

It was in keeping with these recommendations that the United States at the outset of a new era in battleship construction adopted the stand-pat policy by which we were foredoomed to lose our position as second naval power.

It was in accord with President Roosevelt's suggestion that Congress in 1906 and again in 1907 authorized only one battleship, while in 1906 the General Board recommended three, and in 1907 two. It was in accordance with the policy enunciated by Secretary Meyer, under Taft, when in his first report Secretary Meyer said: "Germany is now second among the principal naval powers in warship tonnage built and building. The United States is third;" then, after that statement, recommended, "in order to keep the appropriation for the Navy Department within the economical limit set for

the Government," only two battleships and one repair ship. Hence, no headway was made in the Taft administration toward retrieving the relative strength we had lost under Roosevelt.

In contrasting the small increase under Roosevelt and quoting from his messages, I do not intend to imply that the policy of small construction was inspired wholly or chiefly by him. It was a condition, not a theory that confronted him. In truth, he was doubtless personally in favor of larger naval expansion than the country favored or than Congress would authorize. But he officially made the recommendations quoted above and did not ask for such increase as would have given the United States a navy more powerful than Germany. In view of the big program secured by Wilson in 1916 nobody should conclude that Wilson could have secured a larger program than was secured in 1913 and 1914, or that Roosevelt and Taft, even if they had proposed it, could have secured a large building program in their day. Whatever lack of preparedness this country felt was not due to any one President, to any one party, or to any one Congress. In this country public opinion is the only king, and public opinion did not then demand large appropriations for a big navy, and President Wilson and Congress were in advance of public opinion in 1913 when three dreadnaughts were authorized as against the one dreadnaught authorized in 1912, the last year of Mr. Taft's administration. I remember very well in the summer of 1912 when the naval bill was under consideration in the House. There was a big fight on whether Congress would authorize one or two dreadnaughts. I was a private citizen then, having only the interest of a private citizen in our Navy, but I wrote a letter to every Member of the House of Representatives from North Carolina, my own State, and to some other friends in the House, urging them to support the larger building program. I state this merely to show the difficulty of securing large appropriations and my deep interest in a larger navy before I became Secretary of the Navy.

At that time Congress and the country were not ready to build a big Navy, and this was true of representatives of both political parties. Mr. Cleveland and Mr. Roosevelt favored a larger Navy than the majority of Congressmen of their party. You have been told that lack of large preparation before the war was a grievous fault in the present Secretary of the Navy. If that is true, it is a fault that lies more at the door of preceding Secretaries of the Navy, Presidents before President Wilson, and Congresses before the one of 1913, which made larger provision than any preceding Congress in peace times, and the Congress of 1916, which made larger provision for increasing the Navy than any Congress in the history of the Republic or any Parliament in the history of the world in time of peace. I am presenting here by way of contrast what was done before 1913 and what was done from 1913 to 1916 to point out the comparatively large increase after I became Secretary of the Navy. I grant you, in view of the war needs, that it was too small in all these years before my recommendations of 1915. But the record speaks for itself, and is complete refutation of the criticisms you have heard of securing personnel and ships and munitions before the United States entered the war.

In the last two years of the Taft administration Germany authorized five capital ships and we authorized two. On coming to the pro-

gram of the Wilson administration we find that for the first time in years we authorized a larger program than Germany. In our first two naval bills we provided for five capital ships, against the three contemplated by the Germans in their program at the outbreak of the war. The Wilson administration took steps to secure for the United States that position this country had lost during the Roosevelt and Taft administrations by reason of the policy which prevailed in those years.

As regards battle cruisers, the General Board of the Navy in its first two reports submitted under the Wilson administration did not recommend their construction. It recommended them in 1916 and steps were taken to provide them, and authorization was provided in the bill of 1916 for battle cruisers, the first ever authorized in the United States. It is true that the General Board did recommend two battle cruisers in their recommendations of 1912, but the Secretary of the Navy, Mr. Meyer, did not provide for them in his estimates. Every battle cruiser in the British Navy at the outbreak of the war was authorized before the Wilson administration began, and Great Britain did not authorize or construct a single battle cruiser between March 4, 1913, and the outbreak of the war, while the Wilson administration was in power. In these first three years the Navy became better organized, better officered, better manned, and better supplied with ammunition, and more efficiently and economically administered than ever before in its history. Every branch of the service was improved and the organization of the Navy Department and the Atlantic and other fleets developed to the highest state of efficiency.

In his testimony before the House Naval Affairs Committee, given in 1916, Admiral (then Capt.) J. S. McKean, assistant for material, Office of the Chief of Naval Operations, said:

We have made more real progress in the last two years than in any previous five-year period in my experience in the Navy. I don't think that I have ever known a time when everybody in the service, from top to bottom, was working as hard with their heads and their hands to prepare the fleet for active service.

Admiral Benson, the Chief of Naval Operations, asserted that:

Cooperation between the various bureaus and offices of the department with the Office of the Chief of Naval Operations has been, most cordial and complete, and the practical result has been all that could be desired. A thoughtful consideration of the work that has been accomplished will show that all is being done now that could reasonably be expected from a so-called general staff. In my opinion the organization that exists in the department and that is now in successful operation is accomplishing in a purely American and businesslike manner all that possibly could be expected from the creation of a general staff, and is doing this in a much more satisfactory way.

Admiral George Dewey had this to say:

Our own General Board is, I think, the best general staff in the world.

And Admiral Dewey was right.

Rear Admiral Knight, president of the War College, where high officers of the Navy are instructed in strategy and tactics, testified that:

Secretary Daniels has done more for the War College than any of his predecessors.

It was recognized that the shortage of enlisted men, like the shortage of officers, was attributable to conditions inherited when I came into office. It was presented with a shortage of men, too great to be overcome entirely in any three years of peace, and a prejudice to service in the ranks that had to be corrected before any gains could be made. The Roosevelt and Taft administrations could make no claim to having enough enlisted men to man all vessels of war. The authorized strength of the Navy was far below the number that would have been required, and in the 16 years preceding the Wilson administration none of the administrations in power had made any provision for a reserve with which to fill the gap. The reason the authorized strength was not made sufficient to man properly the vessels was because it had not been possible in years preceding my administration to fill the ranks to the limited strength authorized by Congress. At no time since the Spanish-American War had there been in the Navy enough men to man all vessels for war; and not until the Wilson administration were there enough men to man properly the ships on a peace basis. For years we had built ships without authorizing the men to man them. ✓

When President Roosevelt began his second term the authorized strength of the Navy was 34,500 men. It was inadequate and 3,000 additional men were recommended during his first year. In all, during his second term, 7,500 men were authorized, a number just sufficient to man the new ships authorized during the same period, which required, under the old schedule, since found inadequate, 7,155 men. But it failed to provide a reserve or to cut down the previously existing shortage, which was given as a legacy to the Taft administration.

The ships authorized in the Taft administration require, under the old schedule, 9,886 men, and George von L. Meyer, Secretary during all four years, recommended an increase of only 4,000 men and 1,000 apprentices, which was 4,888 short of the number required to man the ships authorized during his incumbency. Meyer, moreover, failed to provide a single man toward overcoming the accrued shortage of preceding years. Congress, however, authorized an increase of 6,000 men and 1,000 apprentices (4,000 of these having been voted by Congress in the two years preceding the Wilson administration), which was still short over 2,000 the number needed for new ships, and made no provision toward reducing the previous shortages. The Taft administration failed also to establish a reserve. The increase in men actually enlisted was about 3,200.

The Wilson administration became heir to the accumulated shortages of the naval administrations under Roosevelt augmented by the shortages under the Taft administration, and it has been held responsible for the shortcomings by some of the very persons to whom they are due. It must be remembered that, though the authorized strength of the Navy was many thousands short of the number actually required, the Navy was turned over to the Wilson administration about 5,000 men short of the number allowed. There were actually fewer men in the Navy when President Taft and Secretary Meyer left office than there were eight months before, although Congress had in the meantime authorized an increase of 4,000 men, and they had the best season of the year in which to recruit. Under

Secretary Meyer there were 10,360 cases of desertion, and of the experienced men with good records, honorably discharged upon their completion of enlistment, only 52 per cent reenlisted.

This condition of affairs we were obliged to face when we entered office. We were as prompt in remedying it as we were in our effort to remedy the shortage of officers. Vocational and elementary training was established in 1913 in the Navy, and the innovation gradually filled the ranks. It was not possible at once to overcome the prejudice toward the service which the conditions above enumerated must certainly have caused, but enlistment, instead of declining, increased, and in three years 6,331 men were added to the Navy, which is nearly double the increase made in four years under President Taft.

The Navy was short of officers in 1916 because 6, 8, and 10 years previously there were not sufficient midshipmen appointed to the Naval Academy. The United States Navy had depended chiefly upon graduates from the Naval Academy for its officers, the number commissioned from other sources prior to 1914 being so insignificant as to be disregarded, and the first midshipmen to enter the academy under the Wilson administration were not due to graduate until June, 1917. Only time, with the aid of increased midshipmen, could be expected to remedy the condition. Under the Wilson administration the number of midshipmen have been increased, and engineers, aviators, and instructors were provided to give some necessary immediate relief, but as it takes four years to graduate an ensign, any lack of officers in 1916 could not fairly be charged to the Wilson administration.

The Wilson administration could not remedy the shortage of officers immediately, but at once set about to correct the conditions so that at the very earliest possible time the fault would be overcome. Within two months after entering office, and long before any suggestions from outside sources, I recommended, and Congress authorized, an extension of law, allowed by previous administrations to lapse, providing for two midshipmen to each Member of Congress. This permitted about 300 additional midshipmen to enter the academy in the two years following. In 1916 a provision was made that the number of midshipmen shall be in the ratio of three instead of two to each Member of Congress, making 531 additional appointments available at once, or a total of over 800 additional midshipmen, which were provided for in the first three years of our administration. In the previous administrations there had been failure to make increase in the number of midshipmen, and the law which provided for two midshipmen was actually allowed to lapse—that is why there were not sufficient officers in the Navy in 1916.

Turning now to other details of constructive achievement in the Navy, what do we find?

For the first time a continuing policy was adopted for the accumulation of reserve ammunition and other necessary adjuncts for a Navy strong enough and ready to maintain the rights of the Republic.

The Sixty-fourth Congress also appropriated \$3,900,000 for aeronautics and the aviation station, continuing in what was then

regarded as the wise policy of the Sixty-third Congress, which made the first specific appropriation (\$1,000,000) for aeronautics. The appropriation by the Sixty-third Congress permitted the development of naval aeronautics, so that an aviation ship was in the fleet in 1916, and the Aviation Corps had been increased to 18 machines and 150 officers and men, as compared with 4 machines and 4 officers when I became the Secretary of the Navy in March, 1913. The larger appropriations by the Sixty-fourth Congress insured the beginning of the expansion and foundations upon which we could build larger development in war.

The construction of new craft had been prosecuted more rapidly under Wilson than in former years. For example, it took seven years to build the *Virginia*, which was launched in 1906. It took nearly five years to construct the *South Carolina*, which was launched in 1909. At a period when it was more difficult to secure material and labor than ever before in the history of the country the *Pennsylvania*, completed in 1916, was finished in three years and three months, and the *Arizona* in about the same time. Delays in construction of two ships authorized by the Sixty-third Congress were necessitated by elaborate tests essential for securing underwater protection against torpedoes and by the inability to secure bids from private contractors within the sum appropriated. All new ships began then to be equipped with electrical propulsion, a forward step in which the United States leads the navies of the world.

When I became Secretary of the Navy and we undertook the regeneration of the Navy, it was found that there was no mining division and that there were few mines. Contracts were made at once to purchase mines abroad—none could be had in this country—but the European war made it impossible for the contractors to fill the orders. Fortunately the Navy Department had in its contract obtained the right to manufacture mines in this country, and built its own plant. A mining division was organized complete, and for the first time in the history of the American Navy its position in regard to mines and mining became satisfactory and foreshadowed the Navy's construction of the barrage across the North Sea in 1917-18. Moreover, the mines built in this country were built at a cost of between \$175 and \$200 less than the price contracted for their purchase abroad, and a large saving was thus effected. For every 100 mines the Navy had when I became Secretary of the Navy there were 400 mines in 1916—that is, four times as many—and this number was even multiplied.

A like shortage in torpedoes was remedied, and for every 100 torpedoes we had on hand in 1913 there were, in 1916, 158 more ordered or in process of construction, the Navy Department constructing torpedoes at its own plant at a saving of \$1,000 on each torpedo. It had also increased the capacity of torpedo works 433 per cent. Not only were more torpedoes provided for less money but the Navy Department won its suit to prevent a private company from selling its torpedoes to foreign nations, thereby disclosing Navy secrets. In rendering its decision, Judge Cox made this wise declaration, which indorses the policy of the Navy Department under the Wilson administration:

This case illustrates the importance of the United States having a manufactory of its own for the manufacture of torpedoes and other implements of war which

are improved and changed from time to time by the addition of ingenious mechanism, which should clearly be kept secret unless our enemies are to profit equally with ourselves in every improvement which the ingenuity of our Army and Navy Officers may suggest.

As the Navy increased its production of powder the private manufacturer decreased the prices from 80 cents to 53 cents a pound, by direction of Congress after an investigation into its cost. The figures in 1916 showed that the Navy manufactured powder for 34 cents a pound, including all overhead charges, and the reports in 1916 showed we had increased the capacity of the powder factory from 3,000,000 to 6,000,000 pounds per annum, insuring an adequate supply at a minimum cost.

For years the manufacturers of armor plate had been charging the American people excessive prices for armor plate. All three companies manufacturing armor plate offered bids of identically the same figure. Such bids were not accepted and more than \$1,100,000 were saved on three ships by insisting upon competition, but this large saving still left the price far above a reasonable sum. The Sixty-fourth Congress appropriated \$11,000,000 to build an armor plant where armor plate could be manufactured at a less price than was being paid. In addition to cheapening the cost of production, an additional advantage of a Government armor plate plant would be to encourage and give opportunity to its experts to steadily improve the quality of the armor to be used on naval craft. No process is perfect, and the study and experiment will produce superior armor. Secrets of production discovered by Government experts will belong exclusively to the American Navy.

The same Congress also appropriated \$705,611 toward a projectile factory, to cost double that sum, insuring an adequate supply of superior ammunition, not obtainable in 1916, at cost price. By obtaining competition \$1,077,210 was saved on a single contract for projectiles. A Government factory guarantees competition with private manufacturers and the best quality of projectiles.

It was necessary that private shipbuilding yards should increase their facilities to construct the large program that had been authorized. It was the practice before I became Secretary of the Navy to build no ships in any except two navy yards, and their facilities were limited. The Wilson administration had equipped, a provision having been made by the Sixty-fourth Congress to equip, every navy yard to construct naval craft, making it possible to secure more rapid construction of new ships for the Navy in both private and public yards. The fact that the Government can build in its own plants will, in normal times, insure competition in building, and secure prices more reasonable than would be possible if it depended almost entirely upon private shipbuilding yards, as was done in previous years.

At a latter time in the hearing, Mr. Chairman, I will give a statement by yards of the tremendous increase of facilities to build ships. For example, at that time we could not build a submarine in any yard of the Navy, and we were absolutely at the mercy of the two contractors who built submarines. One of the biggest things we have done is to establish at the Portsmouth navy yard facilities for building submarines, where we are building them better and cheaper.

The ordnance experts of the Navy Department designed and completed and placed on latest dreadnaughts the best antiaircraft gun in the world.

In 1916 it had also produced a large caliber gun that would shoot straighter, shoot farther, and hit harder than any gun now in use in any foreign navy. The plan was to place 16-inch guns on the new dreadnaughts.

The unworkable organizations of both the Navy Department and the Atlantic Fleet (in which was centered the chief strength of the American Navy) were supplanted by better ones. Without violating the American ideal of subordinating the military to the civil power, the fleet and the department were organized to effect the most successful operation afloat and ashore.

The grades of admiral and vice admiral were created assuring commensurate rank for responsibility of high command and placing American officers on equality with those of foreign navies holding similar positions.

It was found that the number of chaplains in 1913 was the same as the number authorized in 1841. The Navy had increased from 12,000 men to 51,500, but it had never been thought necessary to increase the number of chaplains in all that 73 years. Upon my recommendation a law was passed allowing 1 chaplain for every 1,250 men in the Navy, providing the spiritual leadership so necessary for an organization comprised largely of boys in their "teens" and young men in their early twenties. A plan was made for a chaplain on every large ship.

Doors heretofore closed were opened to blue jackets. Under new legislation 25 enlisted men, later increased to 100 men, can now be appointed annually to the Naval Academy and qualified to rise from apprentice seamen to admirals. Up to July, 1916, 15 enlisted men have been appointed as assistant paymaster, and 64 to the position of pay clerk, which grade, numbering over 200, will henceforth be exclusively filled by appointment from the ranks. Thirteen enlisted men were promoted to ensign from the ranks during Wilson's three years as compared with three in the previous four years.

Enlisted men were also made eligible to the Aviation Corps and new schools were opened for vocational education. Existing schools were enlarged, this giving opportunity for the best training to ambitious enlisted men who come into the Navy, with a chance to those of superior ability to earn promotion.

While the utmost care was exercised in accepting men for the Navy, causing the rejection of 5 out of every 6 applicants for physical, mental, or moral reasons, the fact that the Navy Department was able to fill and keep the quota of enlistments full, that reenlistments increased from 52 per cent to 85 per cent, that desertions fell off from 216 to less than 90 per month, that the number of prisoners was reduced from 1,800 to 700 under improved penal systems, evidences the increased popularity and efficiency of the service. By providing instruction on every ship and by other means, the naval administration in three years had added over 6,331 men to the enlisted strength of the Navy.

In 1916 the Navy was making all its own mines at a saving of \$145 on each. In smaller economies of various kinds \$2,000,000 had been saved up to the middle of 1916, of which in 1915, \$1,000,000 was reappropriated by Congress for aeronautics and \$800,000 for submarines. The old "misfit" battleships *Mississippi* and *Idaho* were sold

after about six and one-half years of service for \$12,535,275.96, the original cost price of both together, and with \$2,000,000 additional appropriated by Congress, a modern dreadnaught, the *Mississippi*, was added to the Navy.

Perhaps the contrast between the preparation that went steadily on to increase the strength of the Navy in the first three years of Wilson's administration and the preceding years under his predecessors can best be seen in the following table of percentages embracing both material and personnel. These percentages under the Wilson administration embraced the period between March 5, 1913, and September 1, 1916, a period of about three and a half years. I am taking that date, September 1, because it occurred on the 1st day of the month after the passage of the epoch-making bill of August 29, 1916. That was a period of about three and one-half years, while the percentages of the McKinley, Roosevelt, and Taft administrations embrace a full four-year period. I take the period to September 1, 1916, because elsewhere I shall touch upon the even larger expansion made possible by the epoch-making naval bill of August 29, 1916. Here are the table and percentages:

Reserve of munitions, showing the percentages of total orders placed during each administration.

Projectiles:	Per cent.	Mines:	Per cent.
McKinley and Roosevelt.....	5.1	McKinley and Roosevelt.....	
Roosevelt	8.6	Roosevelt, Taft.....	9.7
Taft	22.4	Wilson	90.3
Wilson	63.9	Smokeless powder:	
Torpedoes:		McKinley and Roosevelt.....	17.1
McKinley and Roosevelt.....	.9	Roosevelt.....	20.0
Roosevelt.....	9.4	Taft.....	23.4
Taft.....	18.2	Wilson	39.5
Wilson	71.5		

The CHAIRMAN. Can you, in connection with the table above, give the numbers in each case; the number of the projectiles and of the torpedoes and of the mines, and the amount of smokeless powder, in each case?

Secretary DANIELS. I think so.

Increase in officers, showing by comparison the number of midshipmen appointed at the Naval Academy under the Roosevelt, Taft, and Wilson administrations.

Roosevelt, 4 years.....	978
Taft, 4 years.....	945
Wilson, 3 years.....	1,473

Increase in enlisted men, showing the enlisted personnel of the Navy, as authorized by law.

Roosevelt, authorized 1905.....	37,000
Roosevelt, authorized 1908.....	44,500
Taft, authorized 1909.....	44,500
Taft, authorized 1912.....	51,500
Wilson, authorized 1916.....	79,064

Increase under each administration.

Roosevelt.....	7,500
Taft	7,000
Wilson.....	27,564

All of this, bear in mind, was before September, 1916.

The act of 1916 permits the President, at his discretion, in an emergency, to increase the Navy to 97,000, which would be an increase of 45,500 over the Taft administration.

Enlisted men promoted, showing the number of warrant officers of the Navy appointed ensigns under the Roosevelt, Taft, and Wilson administrations.

Roosevelt, 4 years.....	10
Taft, 4 years.....	3
Wilson, 3½ years.....	17

Those statements are very important and very illuminating, but I do not think it important to read them all. I will insert them in the record.

(The statements referred to are here printed in full in the record as follows:)

Assistant paymasters appointed from among enlisted men, under the Roosevelt, Taft, and Wilson administrations.

Roosevelt, 4 years.....	1
Taft, 4 years.....	3
Wilson, 3½ years.....	15

Prior to the act of March 3, 1915, pay clerks were selected by individual paymaster from any source within or without the Navy. Under the new law, all pay clerks are appointed by the Navy Department from the enlisted personnel.

Increase in aeronautics, showing the expenditures for aeronautic purposes under the Roosevelt, Taft, and Wilson administrations.

Taft, fiscal year 1912.....	\$24,532.79
Taft (8 months) and Wilson (4 months), fiscal year 1913.....	56,032.90
Wilson:	
Fiscal year 1914.....	194,492.46
Fiscal year 1915.....	219,429.20
Fiscal year 1916.....	884,679.28
Fiscal year 1917.....	13,900,000.00

Total expenditures under the Taft and Wilson administrations.

Taft.....	\$61,888.06
Wilson.....	5,217,278.57

Navy appropriations, 1898-1916.

McKinley (4 years):	
1898 (Spanish War year).....	\$144,566,940
1899.....	57,297,569
1900.....	66,949,286
1901.....	83,020,090
McKinley-Roosevelt (4 years):	
1902.....	85,347,345
1903.....	84,993,697
1904.....	103,852,170
1905.....	118,459,897
Roosevelt (4 years):	
1906.....	105,815,342
1907.....	100,893,431
1908.....	130,013,153
1909.....	140,042,555
Taft (4 years):	
1910.....	133,216,693
1911.....	127,818,681
1912.....	129,739,055
1913.....	142,744,167
Total.....	533,519,596

* \$3,500,000 for aviation and \$400,000 for aeronautic station, Pensacola, Fla.

Wilson (3 years) :

1914	\$148, 254, 332
1915	151, 033, 908
1916	313, 300, 095

Total	612, 587, 335
-------	---------------

Total cost of vessels, 1901-1916.

McKinley and Roosevelt	\$107, 006, 642
Roosevelt	83, 192, 938
Taft	127, 747, 113
Willson	655, 289, 806

Secretary DANIELS. Some of the witnesses before this committee have taken up the question of all matters in connection with the Navy since I became Secretary. I am inserting at this place a statement that appeared in my annual report for 1915, showing in brief form the recommendations by the General Board, recommendations by the Secretary of the Navy, and action by Congress for building program from 1903 to and inclusive of 1914, the year in which the World War began.

Recommended by the General Board.	Recommended by the Secretary of the Navy.	Authorized by Congress.
1903.	<i>Secretary Moody.</i>	<i>Act of 1904.</i>
2 battleships, 1 armored cruiser, 3 protected cruisers, 4 scout cruisers, 2 fuel ships, 3 destroyers.	2 hospital ships, 1 battleship, ¹ 1 armored cruiser, ¹ 3 protected cruisers, ¹ 2 to 4 scout cruisers, ¹ 2 submarines, 2 fuelships. ¹	1 battleship, 2 armored cruisers, 3 scout cruisers, 4 submarines, 2 fuel ships.
1904.	<i>Secretary Morton.</i>	<i>Act of 1905.</i>
3 battleships, 6 destroyers, 5 scout cruisers, 6 torpedo boats, 2 fuel ships, 1 gunboat, 2 river gunboats, 2 Philippine gunboats, \$350,000 for submarines.	3 battleships, ² 6 destroyers (if practicable). ²	2 battleships.
1905.	<i>Secretary Bonaparte.</i>	<i>Act of 1906.</i>
3 battleships, 1 gunboat, 2 river gunboats, 3 scout cruisers, 4 destroyers, 4 submarines, 4 torpedo boats, 2 small gunboats.	2 battleships, 1 gunboat, 2 river gunboats, 2 scout cruisers, 4 destroyers, 2 submarines.	1 battleship, 3 destroyers, 8 submarines.
1906.	<i>Secretary Bonaparte.</i>	<i>Act of 1907.</i>
2 battleships, 1 gunboat, 2 river gunboats, 4 destroyers, 2 fuel ships, 4 ships' torpedo boats, 2 scout cruisers, 2 small gunboats, 1 ammunition ship.	1 battleship, and, with hesitation, ² 2 gunboats, 3 river gunboats, 4 destroyers, 2 fuel ships, 4 ships' torpedo boats.	1 battleship, 2 destroyers.
1907.	<i>Secretary Metcalf.</i>	<i>Act of 1908.</i>
4 battleships, 4 scout cruisers, 10 destroyers, 4 submarines, 2 fuel ships, 1 ammunition ship, 1 repair ship, 2 mine-laying ships, conversion of 2 cruisers now on list.	4 battleships, 4 scout cruisers, 10 destroyers, 4 submarines, 4 fuel ships, 1 ammunition ship, 1 repair ship, 2 mine-laying ships, conversion of 2 cruisers now on list.	2 battleships, 10 destroyers, submarines, 2 fuel ships. purchase of 3 new fuel ships.
1908.	<i>Secretary Metcalf.</i>	<i>Act of 1908.</i>
4 battleships, 4 scout cruisers, 10 destroyers, 4 submarines, 3 fuel ships, ammunition ship, 1 repair ship, 2 mine-laying ships, conversion of 2 cruisers now on list.	4 battleships, 4 scout cruisers, 10 destroyers, 4 submarines, 3 fuel ships, 1 ammunition ship, 1 repair ship, 2 mine-laying ships, conversion of 2 cruisers now on list.	2 battleships, 5 destroyers, 4 submarines, 1 fuel ship.
		1 destroyer whose vitals are located below the water line.

¹ Recommended in his hearings before the House Naval Committee. Not in his annual report.² Recommended in his hearings before the House Naval Committee. No specific recommendation in his annual report.

Recommended by the General Board.	Recommended by the Secretary of the Navy.	Authorized by Congress.
1909. 4 battleships, 1 repair ship, 10 destroyers, 4 scout cruisers, 1 ammunition ship, 1 fuel ship (oil tank).	<i>Secretary Meyer.</i> 2 battleships, 1 repair ship.....	<i>Act of 1910.</i> 2 battleships, 2 fuel ships, 4 submarines, 6 destroyers.
1910. 4 battleships, 1 gunboat, 2 river gunboats, 4 fuel ships, 2 tugs, 3 submarine tenders, 16 destroyers, 1 repair ship, 4 scout cruisers, 2 destroyer tenders, 1 mine layer, 2 transports, 1 hospital ship.	<i>Secretary Meyer.</i> 2 battleships, 1 gunboat. 1 river gunboat, 2 submarines, 1 fuel ship, 2 tugs, 1 submarine tender.	<i>Act of 1911.</i> 2 battleships, 1 gunboat, 1 river gunboat, 4 submarines, 2 fuel ships, 2 tugs, 1 submarine tender, 8 destroyers.
1911. 4 battleships, 4 fuel ships, 16 destroyers, 2 destroyer tenders, 5 submarines, 2 submarine tenders, 1 repair ship, 4 scout cruisers, 1 ammunition ship, 1 mine layer, 2 transports.	<i>Secretary Meyer.</i> 2 battleships, 2 fuel ships.....	<i>Act of 1912.</i> 1 battleship, 2 fuel ships, 6 destroyers, 1 destroyer tender, 8 submarines, 1 submarine tender.
1912. 4 battleships, 2 battle cruisers, 2 gunboats, 16 destroyers, 6 submarines, 1 ammunition ship, 2 transports, 1 submarine tender, 1 destroyer tender, 1 supply ship, 1 submarine testing dock.	<i>Secretary Meyer.</i> 3 battleships, 2 battle cruisers, 2 gunboats, 16 destroyers, 6 submarines, 1 fuel ship (conditionally), 1 ammunition ship, 2 transports, 2 tugs, 1 submarine tender, 1 destroyer tender, 1 supply ship, 1 submarine testing dock.	<i>Act of 1913.</i> 1 battleship, 6 destroyers, 4 submarines, 1 transport, 1 supply ship.
1913. 4 battleships, 16 destroyers, 8 submarines, 1 destroyer tender, 1 submarine tender, 2 fuel ships (oilers), 2 gunboats, 1 transport, 1 supply ship, 1 hospital ship.	<i>Secretary Daniels.</i> 3 battleships, 8 destroyers, 3 submarines.	<i>Act of 1914.</i> 3 battleships, 6 destroyers, 8 or more submarines, 1 submarine testing dock.
1914. 4 battleships, 16 destroyers, 3 fleet submarines, 4 scouts, 4 gunboats, 2 oil-fuel ships, 1 destroyer tender, 1 submarine tender, 1 Navy transport, 1 hospital ship, 1 supply ship.	<i>Secretary Daniels.</i> 2 battleships, 6 destroyers, 8 submarines or more (1 to be of seagoing type and 7 or more of coast-defense type), 1 gunboat, 1 oiler.	<i>Act of 1915.</i> 2 battleships, 6 destroyers, 2 seagoing submarines, 10 coast-defense submarines, 1 oil-fuel ship.

Secretary DANIELS. By letter dated October 17, 1903, the General Board of the Navy, organized by the direction of the Secretary of the Navy and constituted of officers of rank and distinction, including the Admiral of the Navy, George Dewey, president, submitted a report expressing its opinion of what the ultimate strength of the United States Navy should be and recommended a program for the completion of the Navy to the strength then believed adequate by 1919. Remember that, 1919. The basis of the fleet recommended was 48 battleships, and lesser units in auxiliaries were recommended in the proportions believed to be best to complete a fighting fleet in the light of the best information obtainable at that time. The influence of new inventions has changed the proportions and characters of some of the lesser units and to that extent has modified in subsequent recommendations the original recommendations of the General Board, but nothing occurred to persuade the board to alter its recommendations as regards the number of battleships.

In its report dated November 17, 1914, which I published as an appendix to my last annual report, the General Board stated that the board—

Believes that these recommendations made from year to year have been both misunderstood and misconstrued in some quarters. The impression prevails

that the General Board has always recommended an annual continuing program of four battleships with accompanying lesser units and auxiliaries. A brief analysis of the recommendations will show the recommendations made were consistent and contemplated the creation of a battleship fleet of 48 vessels by 1919, but did not involve a constant and fixed program of building 4 battleships a year.

It is quite possible that the misunderstanding and misconstruction of the General Board's recommendations may have been due to the fact that its reports and the varying influences which prompted its recommendations were understood by few and seen in their entirety by a still much lesser number. Until the fall of 1913, when for the first time I published in full the recommendations of the General Board, its views were regarded as strictly confidential and withheld even from the committees of Congress which were designated to draft naval legislation. For the last two years reports of the General Board have been published, from which it has been developed that if its recommendations had from the beginning been observed, the construction of two battleships per year would have accomplished its program.

As a matter of fact the program of the General Board contemplated the construction of only two battleships a year, but when the first report was submitted 10 battleships were completed, 14 had already been authorized, and the program of two battleships per year would have by 1915 effected the authorization of 24 more, all of which would have been completed by 1919.

In its report submitted in 1903, recommending new construction to be embodied in the act of 1904, the General Board urged the construction of two battleships, one armored cruiser, three protected cruisers, four scout cruisers, two fuel ships, and three destroyers. The Secretary of the Navy, Mr. Moody, in his report states:

The advice of the General Board and the Board of Construction has been sought and received, and will be submitted to the Members of Congress.

But he made provision in his estimate for the construction of only two hospital ships and two submarines, later recommending before the House Committee on Naval Affairs the construction of one battleship, one armored cruiser, three protected cruisers, two to four scout cruisers, and two fuel ships. Congress with these recommendations before it passed the naval appropriation bill, which provided for the construction of only one battleship, besides one armored cruiser, three scout cruisers, four submarines, and two fuel ships. It will, therefore, be seen that the very first year in which the adoption of a continuing program for the construction of capital ships was recommended by the General Board the Secretary of the Navy recommended the construction of only one vessel of this type, and that Congress authorized but a single battleship.

The following year, 1904, the General Board's program embodied three battleships, six destroyers, five scout cruisers, six torpedo boats, two fuel ships, five gunboats, and \$850,000 for submarines. The recommendation of three battleships was intended to provide the two desired for the regular program, and the third to make up the deficiency of one battleship in the program of the preceding year. Sec-

retary Morton, in his annual report under the caption of "The naval appropriations," states:

The naval estimates for the next fiscal year are large, the largest ever submitted, notwithstanding the fact that they have been cut down from those sent in by the bureaus by more than \$17,000,000—

It does not seem to have been any crime in those days to have cut down estimates by bureau chiefs \$17,000,000—

We have asked for less than the money actually required to continue the naval program as laid down by the General Board, of which Admiral Dewey is the head, notwithstanding all who have studied the question carefully agree that this program should be carried out.

Mr. Morton said that the General Board's program ought to be carried out, but he did not recommend the money, or ask Congress to do it.

The Secretary recommended no new construction in his report, but during his appearance before the House committee he recommended three battleships, and added that, if practicable, six destroyers might also be included. No recommendation was made as to the 18 other vessels besides all the submarines which were recommended by the General Board, and Congress provided for no other vessels than battleships, of which two were authorized. The authorization of two battleships in 1905 still left the Navy in arrears by one battleship of the number recommended by the General Board.

The following year, 1906, the General Board renewed its recommendations for three battleships, two to constitute the number required for the regular program and the third to fill the omission of the 1904 act, and it urged also the construction of four gunboats, three scout cruisers, four destroyers, four submarines, and four torpedo boats. In referring to the estimates he submitted to Congress that year Secretary Bonaparte states in his annual report:

It will be observed on examining them that there is a large reduction in the amount asked for the increase of the Navy, the aggregate of the sums requested for this purpose being somewhat less than what was given for the present fiscal year.

He recommended the authorization of two battleships, two scout cruisers, four destroyers, two submarines, and three gunboats.

And in commenting upon the difference between his recommendations and those submitted by the General Board, Secretary Bonaparte states:

It will be observed, however, that I have assumed the grave responsibility of overruling both boards with regard to the number of battleships and that I have disregarded the advice of the board on construction to make all reductions which economy renders needful in other types. In my judgment, the Navy needs at least four new destroyers,—

That sounds very small in comparison with the 400 built under my administration—

At least two more scouts, and at least one vessel of the *Helena* type. I retain two submarines or submersibles for the sake of experiment and by reason of their comparatively small cost, and the two river gunboats for the last reason and also their ascertained utility.

Then he goes on to say:

A very serious responsibility must rest on any civil officer who, in a matter affecting the national defense, disregards the judgment of those qual-

fied to speak as the authorized representatives of expert opinion. I recognize and accept this responsibility within the limits above set forth. In view, however, of the large reduction made by the department in the estimates of both the General Board and the Board of Construction, I trust that it may meet your views and that of the Congress to authorize promptly the construction of the 13 vessels recommended, as well as the suggested new *Constitution*.

The *Constitution* recommended was to be an armored cruiser. It was proposed that the old frigate *Constitution* be sold and a new vessel, the armored cruiser type, built from the proceeds and named *Constitution* to perpetuate the memory of the old frigate.

The appropriation bill passed by Congress on the receipt of these recommendations provided for the construction of only one battleship, three destroyers, and eight submarines, the scout cruisers and the gunboats being omitted altogether. The provision for only one battleship in this act set the number under construction two behind the number recommended by the General Board.

I may add in this connection that the bill of 1916 provided for a battle cruiser, which I named the *Constitution*, and which is now being built.

As a result of Secretary Bonaparte's decision and the embodiment by Congress in the naval appropriation bill of a proviso stipulating that the battleships should displace 16,000 tons, the *Michigan* and *South Carolina* are about 2,000 tons smaller and 2 or 3 knots slower in speed than the dreadnaught of the same date. On account of these deficiencies these vessels can not be maneuvered with vessels of the dreadnaught type and can not be classified as dreadnaughts.

This was one of the only two incidents in recent years where Congress has sought by legislation to fix the size and type of our battleships in face of battleship development on the part of foreign nations. In his 1906 report Secretary Bonaparte thus expressed his view of the action:

While no practical inconvenience may have resulted from the proviso above mentioned in this particular instance, I deem it my duty to very respectfully submit for the consideration of the Congress the suggestion that the insertion of this proviso has established a precedent of doubtful merit; that its moral effect, both at home and abroad, has not been wholly desirable, and that it appears in forcible contrast to the action of at least one foreign Government in dealing with the same subject matter. It is the universal desire of the construction departments in navies to keep their designs, as nearly as possible, secret; and, so far as I am aware, this is the only instance in which disapproval of this policy has been apparently indicated by the legislative branch of any Government.

The other instance was that in which Congress restricted the size, and, subsequently, the speed and endurance of the *Mississippi* and the *Idaho* so that the vessels were about 3,000 tons smaller than sister ships laid down at the same time. While the vessels, when completed, constituted excellent fighting craft, they had no place in our organization, so that when the opportunity arose to dispose of them by sale to parties who, after their purchase, disposed of them to the Government of Greece, I urged upon Congress the approval of the same and the application of the proceeds toward the construction of a modern vessel, with the result that we disposed of the *Mississippi* and *Idaho* and will obtain in exchange the super-dreadnaught *California*, a vessel of 32,000 tons and enormously

greater effectiveness, which is now under construction at the navy yard, Mare Island.

The CHAIRMAN. Were they sold for sufficient to pay for the new dreadnaught?

Secretary DANIELS. No; we received sufficient to pay for a dreadnaught on the old cost; but the plans for the new dreadnaught made it cost about \$2,000,000 more.

It is regarded unfortunate that Congress in this matter, to the distinct disadvantage of the Navy, should have directed a backward step, and while the situation has been partly remedied by the sale of the *Mississippi* and the *Idaho* and the construction of this fine ship, we should have in the *South Carolina* and *Michigan* vessels of the *Florida* type instead of two ships which are neither dreadnaught nor predreadnaught.

In its report for 1906 the General Board, besides two scout cruisers, four destroyers, four ship's motor boats, two colliers, one ammunition vessel, and five gunboats, and Secretary Bonaparte, notwithstanding the fact that Congress at its last session appropriated for only one battleship, was somewhat reluctant in recommending the construction of more than one in the next program. The view is expressed:

I now think it highly advisable that a consort to the single vessel authorized as a substitute for the last two recommended be authorized at this session, and, if possible, early in the session, so that we may have greater benefit from the increased speed of these larger ships.

But he adds:

With respect to the two battleships, which, with the one already authorized (at the last session), would make three equal in fighting force to any which so far as is known will be possessed by a foreign power at the time of their completion, I have already said that I consider the authorization of one such vessel a consort to the ship already authorized, is clearly demanded by the requirements of reasonable foresight for the national safety under circumstance now existing. I am not prepared to say this so unhesitatingly for the second vessel recommended, but, in view of the unanimous and emphatic advice of all those in the department most competent to speak on such a subject and bearing the responsibility for its proper decision, I deem it my duty to counsel this further addition to our force.

Mr. Bonaparte further recommended five gunboats, four destroyers, four ship's torpedo boats, and two fuel ships. Congress, for the second time in two years, authorized only one battleship, and, with the exception of two destroyers, made no provision for the other types of vessels recommended, both by the General Board and the Secretary of the Navy, and, as a result, the Navy was, within four years after the plan of the General Board was first submitted, three battleships and numerous smaller craft behind the contemplated schedule of construction.

In 1907 and 1908, during the incumbency of Secretary Metcalf, the two reports of the General Board were almost identical. That for 1907 recommended 4 battleships, 4 scout cruisers, 10 destroyers, 4 submarines, 2 fuel ships, 1 ammunition ship, 1 repair ship, 4 ship's motor boats, and the conversion of 2 cruisers into mine layers. In the following year the same recommendation was renewed, except that only 3 fuel ships instead of 4 were recommended, and the ship's motor boats and torpedo boats were omitted. Mr. Metcalf

indorsed the recommendations of the General Board in both instances, and in the two years; that is, by the acts of 1908 and 1909, Congress authorized a total of 4 battleships, 15 destroyers, 12 submarines, 3 fuel ships, and 1 destroyer, whose vitals were to be located below the water line. We were three battleships behind the schedule prescribed by the General Board, and also deficient in the number they recommended in practically every other type of ships.

In his report of 1907, Mr. Metcalf pointed out that while the American Navy at that time enjoyed second place, our position there was largely due to the completion during that year of several heavy ships, but that it could not be retained unless the building of additional ships of the dreadnaught type was authorized.

Upon the inauguration of President Taft, in 1909, Mr. Mayer became Secretary of the Navy. His accession occurred at the time, when, as pointed out by Mr. Metcalf, foreign navies were expanding on a scale unprecedented in modern times. In his first report, dated December 4, 1909, Mr. Mayer, alluding to the construction underway abroad, acknowledges that—

Germany is now second among the principal naval powers in warship tonnage built and building. The United States is third.

In the same report, when recommending increases for the ensuing year, he states:

In order to keep the appropriation for the Navy Department within the economical limit set for the Government, the department recommends only the following new construction: Two battleships; one repair ship.

The General Board at the same time was advocating 4 battleships, 10 destroyers, 4 scouts, 1 repair ship, 1 ammunition ship, and 1 fuel ship, while Congress provided for 2 battleships, 2 fuel ships, 4 submarines, and 6 destroyers. It will be noted that the act of Congress was much more generous in its provision for the Navy than was the Secretary of the Navy in urging construction.

The following year the General Board enlarged somewhat on its recommendation of the preceding year, due chiefly to the failure of the Government to construct the number of vessels it deemed necessary for its program. In 1910 it recommended 4 battleships and 16 destroyers. It is worthy of note that it was not until 1910 that the General Board considered four destroyers the necessary quota for every capital ship. Prior to that time the number varied, but never had exceeded more than two and one-half to one. In addition, three gunboats, four fuel ships, two tugs, five tenders, four scout cruisers, one repair ship, one mine layer, two transports, and one hospital ship were urged. Mr. Meyer, in his recommendations, urged two battleships, one collier, two gunboats, two tugs, two submarines, and one tender. It will be recalled that the preceding year he recommended only two battleships and one repair ship, and in the following year he recommended but two battleships and two fuel ships. At that time Germany was laying down 3 battleships, a battle cruiser, 2 scout cruisers, 12 torpedo boat destroyers, and had appropriated \$3,570,000 for submarines, while the program adopted by the British was even more ambitious.

As already pointed out, Mr. Meyer for the year 1911 recommended but two battleships and two colliers, although in the same report he recognized the great urgency for additional vessels, stating that—

While only two battleships and two colliers are included in the estimates for this year for reasons of economy, the department feels that the deficiencies of the fleet in other types should be borne in mind, and that the following vessels should be provided as soon as practicable without interference with the battleship program of two ships each year.

In recognition of activities abroad he said that:

An examination of the shipbuilding programs of the principal naval powers shows that great activity in warship construction is everywhere manifest at the present time.

For the second time in two years Germany was laying down 3 battleships, a battle cruiser, 2 scout cruisers, 12 destroyers, and authorizing \$3,570,000 for submarines, and the British appropriations were, as during the preceding year, even much greater. It will therefore be noted that in two of the first three years of Mr. Meyer's incumbency he recommended only 4 battleships, 2 fuel ships, and 1 repair ship. In 1911 he added a recommendation for 2 battleships, 2 gunboats, 2 submarines, 1 fuel ship, 1 submarine tender, and 2 tugs; but it will be noted that there was no provision for the battle cruisers, which were at that time being developed by the principal foreign navies, that only 2 submarines were recommended in 3 years, and scout cruisers and destroyers were omitted altogether, so that at a time when other nations were developing vessels of high speed and submarines of great cruising radius, the Secretary of the Navy was recommending no ships faster than 21 knots, and only 2 submarines in 3 years.

For 1911 the general board practically duplicated its recommendations for 1910, and in 1912 they were renewed almost item by item with the exception that 2 battle cruisers were added. The presidential election took place on the 6th of November, and on the 20th Mr. Meyer filed his report. Except that he recommended 3 battleships instead of 4, his recommendations for that year coincided with the recommendations of the General Board, and Congress at that session authorized the construction of 1 battleship, 6 destroyers, 4 submarines, 1 transport, and 1 supply ship.

On December 1, 1913, I filed my first annual report as Secretary of the Navy, and in it I recommended the construction of two battleships, eight destroyers, and three submarines. The General Board advocated a program about the same as it had urged for the five preceding years. Inasmuch as my recommendations differed from those of the General Board, I considered it proper to make public not only the recommendations of the board, but its views concerning the conditions which led to the conclusions embodied in the recommendations. The General Board had every year since 1903 recommended, after careful study, the building program it considered necessary for the proper growth and proportion of ships for the Navy, but it seems that in no instance was the report of the board made public; that frequently its recommendations and always its analyses of the situation had been held as confidential by the Navy Department. It had not been furnished to the committees of Congress on Naval Affairs. Hon. Thomas S. Butler, of Pennsylvania, the oldest

member in point of service, stated during my hearings before the House Committee on Naval Affairs:

Permit me to say, Mr. Secretary, that I have sat on this side of the table in this committee for 18 years, and I have been in the dark for 18 years.

And Hon. Ernest W. Roberts stated during the same discussion:

I recall very well sitting here when Secretary Moody came before us and placed before us the plan adopted by the General Board, which, he stated at that time, was to be regarded as a naval secret. Some years we never did see it. I will be frank to say that in the 14 or 15 years I have been on the committee I have never seen the complete report of the General Board until your report last year and this year. What we have had is the building program; just enumerating the units and classes. That has been given to us a number of times and that is why I am so interested to know how much importance we can attach to this report of the General Board, now that we have it.

While the naval appropriation bill was under consideration by Congress certain parties, who were acting for the Government of Greece, expressed a desire to purchase the battleships *Mississippi* and *Idaho*. I strongly urged upon Congress the passage of legislation which would permit of their sale. This authority was embodied in the naval appropriation bill, and these vessels, which were authorized on March 3, 1903, were sold for the full cost of their construction. Upon my earnest recommendation, Congress further authorized that the proceeds of the sale, \$12,535,275.96, be applied to the construction of a modern dreadnaught. In the same act Congress authorized the construction of 2 dreadnaughts, 6 destroyers, 8 or more submarines, and 1 submarine testing dock, so that in this one year the authorization of two new dreadnaughts and the replacement of the predreadnaughts *Mississippi* and *Idaho* by a later type of ship, 3 modern dreadnaughts, "carrying as heavy armor and as powerful armament as any vessel of their class," were assured to the Navy. This bill was characterized also by the appropriation of a lump sum for the construction of submarines, the only restriction being that at least eight such vessels be built; and the department was thereby enabled to contract for the construction of 7 coast-defense submarines and for a new type of submersible, commonly known as a seagoing or fleet submarine, a vessel of over 1,000 tons, the first of its type to be constructed or authorized by any nation of the world.

In 1914, as in the preceding year, I embodied in my annual report the complete recommendations of the General Board concerning the new construction deemed by the board advisable. Its program was in most respects a duplicate of those which the board had made for the preceding five years, except that a specific appropriation for air service was recommended, and for the first time we find the seagoing submarine mentioned in the report of the General Board. I renewed in my report the recommendations of the preceding year for 2 dreadnaughts and 6 destroyers, and submitted a further recommendation for a gunboat, an oiler, and 8 or more submarines, at least one of which I considered should be of the seagoing type; and I took the liberty to ask that Congress consider fully the conspicuous successes achieved within the preceding months by submarines operating in the European war and to make such additional provision for vessels of this type as the revenues would justify. Congress signalized its appreciation of the needs of the Navy by passing the largest naval appropriation bill recorded in our history to that time; and by wisely

restricting disbursements ashore to the exclusion of all unimportant military works, the largest possible sum was applied to the development of the Navy afloat. This policy enabled the authorization of 2 battleships, 6 destroyers, 1 fuel ship, 16 coast-defense submarines, 2 seagoing submarines, and \$1,000,000 for aircraft.

Thorough consideration of the present and future requirements of the service has led to the recommendation of the five-year program, to which reference is made in my report of this year. The adoption of a continuing program by the executive department of the Government is a distinct innovation. No previous administration has espoused a program looking to meet the needs of the service beyond the current year; and, as the foregoing résumé of recommendations demonstrates so conclusively, the only continuing program which has heretofore existed, that of the General Board, has, almost without exception, been disregarded by both the legislative and executive departments of the Government.

BUILDING PROGRAM AFTER THE WAR.

What shall be the building program of the immediate future for our Navy? That is a pertinent inquiry in view of the general question of preparedness that has been brought out in testimony before your committee. The answer to that question was set forth by me in my hearing before the Committee on Naval Affairs, House of Representatives, March 6, 1920, and is as follows.

Mr. Chairman, I am on a program to make two speeches this afternoon, and my voice is somewhat hoarse, and if it suits you I will put in the record this quotation from that hearing without reading it and wait until Monday morning to continue my statement further.

The CHAIRMAN. Very well.

(The quotation from the hearing referred to is here printed in the record in full, as follows:)

The Naval Committee of the House of Representatives in 1916 enacted a measure which, when the world becomes normal, will be regarded as having, with practical wisdom and vision, set forth the American policy as to naval expansion and world peace. On the day he reviewed the Pacific Fleet at Seattle September 13, 1919, the President of the United States said that when he stood for a plan for general disarmament he was obeying the mandate of the Congress of the United States, and added: "In a very unexpected place, namely, in a naval appropriation bill passed in 1916, it was declared to be the policy of the United States to bring about a general disarmament by common agreement, and the President of the United States was requested to call a conference not later than the close of the then present war for the purpose of constituting and agreeing upon a plan for a permanent court of international justice; and he was authorized, in case such an agreement could be reached, to stop the building program provided for by that naval appropriation bill."

Inasmuch as, after providing for the construction of the largest number of fighting ships ever before authorized in one measure by any country in the world, that bill looked toward an end of competitive naval building, it may be well to recall the mandate to which the President referred. The bill authorized the construction of 10 dreadnaughts, 6 battle cruisers, 10 scout cruisers, 50 destroyers, 9 fleet submarines, 58 coast submarines, 3 fuel ships, 1 repair ship, 1 transport, 1 hospital ship, 2 destroyer tenders, 1 fleet submarine tender, 2 ammunition ships, 2 gunboats, and after authorizing these additions to our Navy, unprecedented in number and cost, the bill contained the following epoch-making provision:

"It is hereby declared to be the policy of the United States to adjust and settle its international disputes through mediation or arbitration to the end that

war may be honorably avoided. It looks with apprehension and disfavor upon a general increase of armament throughout the world, but it realizes that no single nation can disarm, and that without a common agreement upon the subject every considerable power must maintain a relative standing in military strength.

"In view of the premises, the President is authorized and requested to invite at an appropriate time, not later than the close of the war in Europe, all the great Governments of the world to send representatives to a conference which shall be charged with the duty of formulating a plan for a court of arbitration or other tribunal, to which disputed questions between nations shall be referred for adjudication and peaceful settlement and to consider the question of disarmament and submit their recommendation to their respective Governments for approval. The President is hereby authorized to appoint nine citizens of the United States, who, in his judgment, shall be qualified for the mission by eminence in the law and by devotion to the cause of peace, to be representatives of the United States in such a conference. The President shall fix the compensation of said representatives, and such secretaries and other employees as may be needed. Two hundred thousand dollars, or so much thereof as may be necessary, is hereby appropriated and set aside and placed at the disposal of the President to carry into effect the provisions of this paragraph.

"If at any time before the construction authorized by this act shall have been contracted for there shall have been established, with the cooperation of the United States of America, an international tribunal or tribunals competent to secure peaceful determinations of all international disputes, and which shall render unnecessary the maintenance of competitive armaments, then, and in that case such naval expenditures as may be inconsistent with the engagements made in the establishment of such tribunal or tribunals may be suspended when so ordered by the President of the United States."

The three-year program of construction followed a recommendation by the President, approving the plan outlined by the Secretary of the Navy in his annual report of 1915. In his message to Congress, delivered December 7, 1915, President Wilson said:

"The program which will be laid before you by the Secretary of the Navy is similarly conceived. It involves only a shortening of the time within which plans long matured shall be carried out, but it does make definite and explicit a program which has heretofore been only implicit, held in the minds of the committees on naval affairs and disclosed in the debates of the two Houses, but nowhere formulated or formally adopted. It seems to me very clear that it will be to the advantage of the country for the Congress to adopt a comprehensive plan for putting the Navy upon a final footing of strength and efficiency and to press that plan to completion within the next five years. We have always looked to the Navy of the country as our first and chief line of defense; we have always seen it to be our manifest course of prudence to be strong on the seas. Year by year we have been creating a Navy which now ranks very high, indeed, among the navies of the maritime nations. We should now definitely determine how we shall complete what we have begun and how soon.

"The program to be laid before you contemplates the construction within five years of 10 battleships, 6 battle cruisers, 10 scout cruisers, 50 destroyers, 15 fleet submarines, 85 coast submarines, 4 gunboats, 1 hospital ship, 2 ammunition ships, 2 fuel-oil ships, and 1 repair ship. It is proposed that of this number we shall the first year provide for the construction of 2 battleships, 2 battle cruisers, 3 scout cruisers, 15 destroyers, 5 fleet submarines, 25 coast submarines, 2 gunboats, and 1 hospital ship; the second year, 2 battleships, 1 scout cruiser, 10 destroyers, 4 fleet submarines, 15 coast submarines, 1 gunboat, and 1 fuel-oil ship; the third year, 2 battleships, 1 battle cruiser, 2 scout cruisers, 5 destroyers, 2 fleet submarines, and 15 coast submarines; the fourth year, 2 battleships, 2 battle cruisers, 2 scout cruisers, 10 destroyers, 2 fleet submarines, 15 coast submarines, 1 ammunition ship, and 1 fuel-oil ship; and the fifth year, 2 battleships, 1 battle cruiser, 2 scout cruisers, 10 destroyers, 2 fleet submarines, 15 coast submarines, 1 gunboat, 1 ammunition ship, and 1 repair ship.

"The Secretary of the Navy is asking also for the immediate addition to the personnel of the Navy of 7,500 sailors, 2,500 apprentice seamen, and 1,500 marines. This increase would be sufficient to care for the ships which are to be completed within the fiscal year 1917, and also for the number of men

which must be put in training to man the ships which will be completed early in 1918. It is also necessary that the number of midshipmen at the Naval Academy at Annapolis should be increased by at least 300 in order that the force of officers should be most rapidly added to; and authority is asked to appoint, for engineering duties only, approved graduates of engineering colleges, and for service in the Aviation Corps a certain number of men taken from civil life.

"If this full program should be carried out we should have built or building in 1921, according to the estimates of survival and standards of classification followed by the general board of the department, an effective Navy consisting of 27 battleships of the first line, 6 battle cruisers, 25 battleships of the second line, 10 armored cruisers, 13 scout cruisers, 5 first-class cruisers, 10 third-class cruisers, 108 destroyers, 18 fleet submarine, 157 coast submarines, 6 monitors, 20 gunboats, 4 supply ships, 15 fuel ships, 4 transports, 3 tenders to torpedo vessels, 8 vessels of special types, and 2 ammunition ships. This would be a Navy fitted to our needs and worthy of our traditions."

In December, 1918, in order to insure a Navy adequate for the United States, I recommended another three-year program, and in his message to Congress December 2, the President said:

"I take it for granted that the Congress will carry out the naval program which was undertaken before we entered the war. The Secretary of the Navy has submitted to your committees for authorization that part of the program which covers the building plans of the next three years. These plans have been prepared along the lines and in accordance with the policy which the Congress established, not under the exceptional conditions of the war, but with the intention of adhering to a definite method of development for the Navy. I earnestly recommend the uninterrupted pursuit of that policy. It would clearly be unwise for us to attempt to adjust our program to future world policy as yet undetermined."

In the hearings before the Naval Affairs Committee of December 30, 1918, advocating the future naval policy for the United States, I said:

"It is our duty to consider the obligations imposed upon America if the peace conference now occupied at Versailles upon the greatest task which ever engaged the attention of a human gathering during the whole course of the world's history completes its work constructively and satisfactorily, as we all hope it will do. Let us assume that this conference will give birth to some plan looking toward a concert of the nations for the maintenance of peace, whether it be a league of nations, according to the present acceptance of the meaning of that term, or what not. It will be some manner of body to which differing nations will perforce submit their differences for adjudication and which will be sufficiently powerful to induce acceptance of its decisions when once they shall be made.

"The experience of poor and imperfect humanity has very fully taught the lesson that power for the enforcement of judicial decisions sometimes needs to be considerable; and back of that must lie a tremendous police power of prevention if judicial decisions are to be made as infrequent as possible, indeed, if society is to exist at all. Arbitration which had behind it no power capable of compelling the disputants to accept the decisions of the arbitrators would have no value whatsoever in cases of serious emergency.

"It seems self-evident that a world police must be established to achieve this purpose, no matter what the constitution or plan of operation of the peace league may be. That world police will be very largely naval, for only a police equipped with and trained to ships could be world mobile, and a world police which could not move speedily and powerfully about the world would be as valueless and impotent as a city police incapable of traversing the city's streets.

"This being true, it becomes obvious that if the United States is to participate in such a movement, it must participate upon a scale commensurate with its wealth, intelligence, great population, and scientific attainments. Any lesser participation would be shirking of its duty. A contribution less in cost, strength, or any detail of perfection than that of any other member of the league would be undignified and unworthy of a nation which by Providence has been as generously endowed as the United States.

"I am quite certain that it would be improper for America even to consider the proposition of contributing to the world police a number of units smaller than that contributed by the greatest other power. It seems to me

that this is obviously the American duty, and that the other nations of the world would be justified in regarding us as shirkers if we failed to accept the burden of it cheerfully and turn to the performance of it with an unexampled earnestness and high efficiency. It would be contrary to all our traditions and all our ideals to assume that in the planning of a new and mighty navy America could be animated either by fear or the intention of aggression.

"What if, unhappily, the peace conference should fail to come to an agreement upon such a plan? Suppose the powers do not now agree to curtail armament, then it is entirely obvious to all that the United States, if she is to realize her destiny as a leader of the democratic impulse, if she is to play her proper part (as she, hand in hand with her incomparable Allies, has played it in this war) in the protection of small nations, the preservation of the freedom of the seas for them and for the world at large, must have a Navy that will be as powerful as that of any nation in the world.

"It is my firm conviction that if the conference at Versailles does not result in a general agreement to put an end to competitive naval building on the part of all nations, then the United States must bend her will and bend her energies, must give her men and give her money to the task of the creation of incomparably the greatest Navy in the world. She has no designs upon the territory or the trade of any other nation or group of nations. But she is pledged to the support of the Monroe doctrine; she is pledged to the protection of the weak wherever they may suffer threats; she is incomparably rich, incomparably strong in natural resources; if need be she must be incomparably strong in defense against aggressors and in offense against evildoers.

"America is committed to the promise of entering into a general and genuine plan for the reduction of armaments. If the outcome of the peace conference shall be that all nations will concur in this idea, then the United States will gladly join them in the worthy plan. For three years we have been committed to such a program in such circumstances. But if such an agreement can not be shortly arranged, then we, here in America, must accept the burden which the failure automatically will thrust upon us and meet it by adding such units to our Navy as will secure our own safety and aid powerfully in protecting the peace of the world."

At a later hearing before your committee on May 27, 1919, after exchanging views with leading members of the committee, in answer to an inquiry as to the new three-year program, I stated that I would not ask its incorporation in the 1920 bill, and said:

"I am not asking for its retention because of my faith in the League of Nations, by which we shall come to what this committee foreshadowed in its action three years ago—the first peace league legislation in history. This Naval Affairs Committee blazed the road upon which we are now traveling."

Your chairman said: "I am in harmony with you on that. It is only my personal view, however."

I pointed out that due to the imperative necessity of building destroyers and other small craft to meet war needs we had not been able to make the progress in the construction of capital ships which would otherwise have been made, and stated:

"Therefore I now find 'that with the extraordinary expenses during the coming fiscal year we could not begin the construction of any capital ships except those authorized in 1916.' There was some suggestion that work on those already authorized be deferred, but I took the ground that under any circumstances all those ships would be needed to give our Navy sufficient modern powerful and fast ships to enable us to have an adequate mobile police force of the sea, and I stated what was the position of the Navy Department then and now:

"We have only two courses to pursue: We must have a league of nations by which every nation will help preserve the peace of the world without competitive navy building, or we must have incomparably the biggest navy in the world. There is no middle ground."

Your committee made no provision for a new building program in the last Navy bill, and the paramount question as to future naval expansion revolves around what new construction will be authorized in this year's bill. In my annual report I stated that specific recommendation would be reserved until such time as I should appear before your committee.

I had hoped, gentlemen, to appear before you to-day with a final recommendation as to a building program for the Navy, but as the peace treaty has not

yet been acted upon by the Senate there are uncertainties in the situation. If the covenant had been ratified, our duty would have been made plain. With the league in operation, composed at first of all the nations allied or associated in the World War and with provision for the admittance of all other nations opposed to conquest and militarism, it would not be necessary to impose on the taxpayers of America, in view of present burdens, the money necessary for building more capital ships by appropriations in this bill. I have had presented to me, and Admiral Badger, in his hearing, has presented to you the building program for the next fiscal year proposed by the General Board, which is as follows:

Battleships.....	2
Battle cruisers.....	1
Scout cruisers.....	10
Flotilla leaders.....	5
Submarine (fleet).....	6
Airplane carriers.....	2
Aircraft tenders.....	2
Destroyer tender.....	1
Submarine tender.....	1

You have had before you the members of the General Board, who have given you their views as to the necessity of continuing our building program and making our Navy, step by step, of the proper size, and their views are entitled to the most serious consideration. I am entirely in harmony with the statements made before this committee by Admiral Badger as to the military need of the General Board's program if the United States elects to remain out of the League of Nations; but, under conditions as they exist to-day, I am not recommending additional dreadnaughts, battle cruisers, and scout cruisers in the pending bill, though these ships are the backbone of naval efficiency.

Had the peace treaty been settled upon, with the possibility of armaments being curtailed and regulated as originally suggested by your committee in 1916, I would have submitted a program to-day which would have looked only to rounding out the Navy along the lines found necessary by our experience in the late World War.

Two battleships authorized prior to 1916 are now nearly completed, and we are building, under the three-year program of 1916, 10 battleships more powerful than any foreign battleships afloat and 6 battle cruisers superior to any foreign vessels of their class. There are also 10 scout cruisers under construction. Our new construction, however, as well as our existing forces, are deficient in several types of vessels which during the World War were found essential to effective fleet operations. These types are, in order of importance, the airplane carrier, light scout and light cruisers, the mine-laying light cruiser, the flotilla leader, the fleet submarine and destroyer, and submarine tenders. To properly round out our fleet, these types are necessary. The deficiencies along these lines in our authorized forces came about as follows:

Previous to 1916 the United States naval-building policy was governed by the acknowledged supremacy of the battleship. We believed that it was essential to give the Navy adequate battleship strength first. In 1916 we undertook for the first time a program which was fairly balanced.

While the three-year building program of 1916 still gave the first place to battleships, other types of vessels were not ignored. The inclusion in that program of 6 battle cruisers and 10 scout cruisers was due to the growing importance placed upon information in the conduct of naval warfare and a recognition of the fact that the speed of modern fleets was becoming such that merchant ships could no longer be counted upon to perform the essential scouting operations. Destroyers and submarines were included in our building program, and likewise auxiliaries required to supply this fleet.

With the World War came the wonderful development of the submarine and of aircraft, but before we were able to apply the experience of this development to our naval forces we, too, were plunged into the war. The nature of the naval operations of the war was such that the principal offensive action which could be taken by the United States Navy was that against enemy submarines. In order to render the greatest possible and immediate service in the war, our major-ship program was largely suspended, and virtually the entire building energy available for naval vessels was expended in the construction of destroyers, submarines, submarine chasers, and other antisubmarine craft. We

have constructed since 1916, 176 destroyers, 63 submarines, and hundreds of other ships of small type, including 441 submarine chasers.

The activities of the United States Naval Air Service were restricted to those in which our aircraft could be most effectively used against the enemy, namely, operations against enemy submarines and bombing raids by aircraft operating from shore bases.

At present the United States has only one airplane carrier to be converted, three light cruisers which are old, no flotilla leaders, nine fleet submarines authorized.

Great Britain, which had a better balanced fleet before the war and continued building during the war on a more nearly balanced scale, while we specialized on destroyers and other antisubmarine craft, has the following:

Airplane carriers.....	6
Light cruisers.....	76
Flotilla leaders.....	30
Fleet submarines.....	21

Thus, as a result of the changes in naval warfare due to the development of the submarine and aviation, and to the sacrifice the United States Navy made to win the war, our fleet is weak in the types which the World War proved were essential to fleet efficiency.

The question for you to decide is whether the United States in future building shall undertake simply to round out its Navy by building units of types in which we are now short or shall embark on further expansion in addition. In the unsettled condition of the world to-day our Navy must be prepared for any emergency. It was my purpose, due to economic conditions and on the supposition that the peace treaty would, by this time, have been ratified, to recommend the following moderate building program for the year 1920-21, to round out our fleet, viz:

Light cruisers.....	10
Mine-laying light cruisers.....	6
Flotilla leaders.....	10
Fleet submarines.....	6
Airplane carriers.....	4
Destroyer tender.....	1
Submarine tender.....	1

And I intended to await future events before recommending further increase in our major ship construction. However, in case the peace treaty is not ratified at the present session of Congress, I am constrained to recommend the authorization of the following building program, viz:

Battleships.....	2
Battle cruiser.....	1
Scout cruisers.....	6
Light cruisers.....	20
Mine-laying light cruisers.....	8
Flotilla leaders.....	20
Fleet submarines.....	6
Aeroplane carriers.....	4
Destroyer tender.....	1
Submarine tender.....	1

If it shall turn out that the United States definitely decides not to become a party to the proposed League of Nations, I shall feel it my imperative duty to renew my recommendation of last year for the authorization by this Congress of another three-year program, with such changes as to types as the lessons which the World War has taught us in the construction of fighting ships.

(At 11.05 o'clock a. m. the subcommittee adjourned until Monday, May 17, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

MONDAY, MAY 17, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235, Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman) and Keyes.

The CHAIRMAN. The committee will come to order. Will you proceed, Mr. Secretary?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. Mr. Chairman and gentlemen, it can not have escaped members of this committee that running like a thread through most of the evidence has been an advocacy of a General Staff for the conduct of the American Navy, and the elimination of civilian control. Some of the officers have frankly avowed their advocacy of Prussianizing the Navy. Some of them have been loud in declaring they would not advocate doing away with civilian authority, "but," and that "but" in nearly every case, stripped of verbiage, looked to substituting military for civilian authority. There is nothing new about such advocacy. Secretary Chandler had to meet it when it raised its un-American head during his term as Secretary of the Navy and he crushed it. Other Secretaries have met it. Now and again it has been presented, generally camouflaged as now, but the snake had only crawled into its hole, ready to appear again in another shape when it was deemed ripe for presentation.

I shall never forget the only piece of advice Secretary Meyer gave me when I succeeded him as Secretary of the Navy. He had introduced me to his aids, explained their position and lack of final power, and afterwards declared that there were officers of the Navy who wished less power for the Secretary and more for themselves. "Power lies there," he said, pointing to the Secretary's desk, "and it should remain here." Not many months later, when Admiral Fiske and other disciples of the Von Tirpitz system of naval control, sought to organize the American Navy on the Prussian plan, I understood more fully Secretary Meyer's weighty words.

Let me state to you gentlemen and to all Congress and to the American people as plainly as I can what is at bottom behind all this blatant hue and cry you have been deluged with. Of course,

the original charge showed hostility to certain officers and desire to damage the ranking officers who directed operations during the war, and the evidence has disclosed a desire to misrepresent the actions of the Secretary of the Navy because he was not a rubber-stamp Secretary. But deeper than egotism and prejudice, if you have not already seen the cloven foot, you will find a deep-seated determination to organize the Navy Department upon the approved Prussian plan by giving all power to the military and taking all away from the civilian. When he appeared before the House Naval Affairs Committee in 1916, Admiral Sims was discussing target practice and so-called defects in turrets, when he was asked this question :

Could we have had those defects in the design of turrets under a general staff?

And his reply was :

No, sir ; we could not have had them.

There are not a few officers of ability and deservedly high standing in the Navy, aside from the critics, who wish to substitute military for civilian authority in the administration of the Navy. They believe that an admiral should absolutely dictate the whole naval policy, but few of them are ready to advocate the policy which you have found in the testimony of some of your witnesses. They fail to understand the genius of American administration and incorrectly suppose that the plan of government on a battleship would work in the Navy Department. I have no quarrel with any officer who believes the Prussian system is better than the American system or who favors a general staff or some other centralized military, rather than civilian, authority in the Navy Department. They have their right, and it is for Congress to adopt the best policy. But, gentlemen, most of those who advocate this radical departure seek to camouflage their Prussian ideas. They say they do favor a civilian Secretary and have not thought of a naval officer as Secretary. What they desire, gentlemen, is a civilian rubber-stamp Secretary with no power except to draw his salary and "sign here" when the military chieftains tell him where to affix his name.

If this country wishes to reverse its national policy of civilian authority in the Navy, let it do so with its eyes open and with full knowledge of what the radical departure from Americanism means. Personally it concerns me no more than it concerns over 100,000,000 other American citizens.

I can see an argument in favor of military control. A Navy officer, trained in the naval profession, as Secretary of the Navy would be better qualified to navigate a ship and to pass on technical matters than any civilian. If we are to change the American policy of substituting military for civilian rule, then we should do so directly and clearly and without pretense. If we are to depart from our national policy we should provide that the Secretary of the Navy shall be an admiral in the Navy and that no civilian shall be eligible for that position.

You will find, if you have not already observed it, that the often exposed and defeated plan of a dummy as Secretary of the Navy is what will be desired by the most ardent advocates of the so-called "military responsibility," and that no civilian Secretary of the Navy will be satisfactory to that class unless he is willing to be a figurehead.

I have had the honor to hold this great office more than seven years, a longer period than any of my predecessor except Gideon Welles. It has been seven perfectly happy years, with just enough criticism to make the job really interesting. I have seen the Navy grow from 43,000 men to more than half a million; from 3,161 officers to 32,000; from 326 ships to 1,000, with a total of over 2,000 manned and operated by the Navy during the war; with appropriations for a single year from \$142,000,000 to over \$1,900,000,000. I have been honored to direct the policies of this great Navy in the World War, and to have the world applaud its large contribution. And yet there has never been a time, except in the throes of war, when those who wished a Von Tirpitz and military control have not been ready to discount the great work of the department and the Navy in order to try to induce Congress to enact legislation which would take the administration of the Navy out of civilian hands and put it in military hands. Their advocacy of the change is not personal, even by those who have found their chief occupation in criticizing the policies for which I stand. They wish a Germanized Navy. Before the war some of them openly avowed that the German military method was their model. Since the failure of the German plan they do not call their demand for "full military responsibility" by its right name, but they continue to criticize minor mistakes in order to try to secure a Prussianized naval administration.

It would be a mistake, however, to suppose that all who advocate some change belong to that class. There are, of course, differences of opinion as to the best method of administration—honest differences, entitled to every consideration and study. I have never yet known a perfect organization. Suggestions for improvement along American lines are, of course, helpful when they are consistent with American ideals. I see no perfection in any particular organization. I am inclined to hold, with Pope:

For forms of government let fools contend;
Whate'er is best administered is best.

In no English-speaking nation is a military officer in authority in the direction of naval policy or naval administration. Some of those who advocate a change in our organization have told you that in Great Britain the first sea lord is the real authority and not the first lord of the Admiralty, the head of the British Navy, whose office and responsibility correspond with the American Secretary of the Navy. It may interest you and contribute to throw light upon the question of naval administration to give you the powers of the first lord of the Admiralty in Great Britain. The following extracts are from Naval Administration, by Admiral Sir R. Vesey Hamilton, G. C. B., late first sea lord of the Admiralty (British Parliamentary Paper, Dardanelles commission, 1917):

Under the order in council of March 19, 1872, the first lord is made "responsible to Your Majesty and to Parliament for all the business of the Admiralty," and the naval lords are made severally responsible to the first lord for the administration of the business assigned to them. It was in the order in council of January 14, 1869, that this sole responsibility—

I call your attention particularly to that fact, gentlemen—

of the first lord was first officially laid down, but the evidence given by the naval and civil lords before the select committee of the House of Commons in 1861

clearly shows that this was but a formal sanction to a practice that had existed long before. * * *

The first lord of the Admiralty: The responsible head of the naval administration is the cabinet minister known as the first lord of the Admiralty, who, as a member of the Government, is the channel through which the navy receives its political direction, and, through successive first lords, is shaped in character and strength in accordance with the imperial policy * * * being responsible—

This is the first lord, now—

for all the business of the Admiralty, he possesses the power both of initiative and veto. By his supreme direction our maritime affairs are conducted. He is the representative of the navy in Parliament. To him the country looks for its readiness and sufficiency. In practice, as a civilian, the first lord depends very largely upon the other lords, * * * but inasmuch as the first lord has selected or accepted his advisers as the most able of professional men, he is very largely guided by their views. * * *

In consultative duties, all questions brought before the board are thoroughly considered and thrashed out—

And I beg to call attention to this following sentence—

but the first lord has necessarily the final decision—

Exactly as it is in America and in every other English-speaking nation in the world—

His responsibility being that of a cabinet minister * * *

No paper is laid before the board except with the first lord's approval—

In Great Britain none of the other lords can even suggest a policy without the approval of their secretary of the navy—

and a schedule is prepared beforehand of the matters to be brought up at the board for the information of the members—

Now, the difference between the duties and policies outlined here is that in our Navy we have a meeting every Thursday at which the Secretary of the Navy, the Assistant Secretary of the Navy, the Chief of Operations, and all the bureau chiefs meet in the same capacity as if it were a cabinet, and any member of that council is not only privileged but is requested to bring up any matter connected with naval preparation, naval organization, naval administration, and to discuss freely and fully. Their initiative is invited, and concrete policies and problems are discussed at this Thursday meeting every week; and during the war we had these meetings oftener, and if the meeting was not officially called oftener the Secretary of the Navy and the Chief of Operations and the bureau chiefs were in consultation every day and every night on some phase of the war, so that always the Secretary had the advice and consultation of the most trained and expert men in the Navy.

This article proceeds:

What is clear is that the first lord being responsible, the other lords are responsible to him—

That is, to the first lord of the Admiralty—the secretary of the navy—

for the advice they give; and Sir Evan MacGregor, permanent secretary, has expressed the view that their responsibility ends when they have given their opinion at the board to the first lord. * * *

The functions of the first sea lord are defined, *inter alia*, in the following terms:

“Preparation for war. All large questions of naval policy and maritime warfare—to advise.”

The other members of the board are charged with various departmental duties.

Neither the first lord nor the first sea lord are under any legal obligations to consult either the board collectively or any individual members of the board, but the Official Procedure and Rules, page 51, contains the following:

"It is to be understood that in any matter of great importance the first sea lord is always to be consulted"—

Now, the program here is that the Chief of Staff or some Von Tirpitz is to go ahead and out of his own head to operate the Navy; the Secretary is to be a rubber stamp, and his responsibility is to be to Congress and to the people, and not to the Secretary.

In Great Britain it is to be understood that in any matter of great importance, the first sea lord is always to be consulted—that is, the secretary of the navy—

by the other sea lords, the civil lord, the additional civil lord, and the parliamentary and permanent secretaries; but each member of the board and the parliamentary and permanent secretaries will communicate direct with the first lord. * * *

One of the wisest and ablest and most scholarly men who has occupied the portfolio of Secretary of the Navy was Hon. John D. Long, formerly governor of Massachusetts, who became Secretary in President McKinley's Cabinet. It was under his able administration that our Navy won increased fame in the naval victories of the Spanish-American War. After his retirement, he wrote an interesting and delightful book, the *New American Navy*, in which, in addition to delightfully telling the story of naval achievements in the Spanish-American War, the Secretary closed volume 2 (pp. 182-186) with a discussion of the issue that has been raised in these hearings: Civilian or military direction of the Navy. It is a clear, convincing, and illuminating answer to all those officers who, in their zeal for full military responsibility, have forgotten the genius of our American Government. And, Mr. Chairman, I wish to emphasize that. Every officer who comes before you and advocates military responsibility ought to go back and read the debates before we adopted the Constitution; he ought to learn something about the genius of America; he ought to understand that the fathers who founded this Government never would permit a military man to be the Secretary of War or the Secretary of the Navy. Secretary Long closes with this wise admonition, which is as applicable and sound to-day as when penned by that distinguished Secretary of the Navy:

Precedent quickly hardens into an inflexible system, and the first step should not be taken toward a military head of any department of Government.

Secretary Long's argument is as follows:

OURS IS A CIVIL, NOT A MILITARY, GOVERNMENT.

Ours is a civil and not a military Government. The President is a civilian, and, if he has had military experience, it is an incident in his availability as a presidential candidate rather than an element in his qualifications for the presidential office. The heads of the Army and Navy Departments are civilians. The fundamental principle of our Constitution is that the military is subordinate to the civil function. Then, too, as a matter of expediency as well as of principle, it is better that the head of each department should enter upon his duties with an open mind and without the possible bias of prejudice of favoritism which might come from having been himself a lifelong member of the body over which he is placed. There must, of course, be the expert and professional knowledge of the trained naval officer; there must be experience with

ships and navy yards, with seamen and marines, and with all the details of naval life; but these are amply supplied by the men who are called around the Secretary, and placed by him in charge of the various bureaus of administration which have been described in former chapters, and the merits of the services of the chiefs of which has been heretofore acknowledged with the warm appreciation of one who has seen and felt their competency and devotion. The present general system of the administration of the Navy Department, as it has now existed for many years, has stood the test of all that time, including two recent wars, and the upbuilding of the new Navy during the last two decades. It is possible that some better system might be devised, but with the constant improvements in details which will incidentally attend it in the future, as has been the case in the past, no better system in general outline has been, or is likely to be, suggested. Certainly no change should be made which, while seeming to maintain the present relation of the Navy to a civilian head in form, will displace it in fact. For this reason it has seemed to me that the General Staff, which, so long as it is subject to appointment and control by the Secretary, as originally instituted by me, is a very valuable adjunct in insuring preparedness for war, should not be put by legislative enactment beyond immediate civilian control.

Certainly no such act should be passed with reference to the Navy as was passed in the last Congress in regard to the General Staff of the Army, which makes the chief of that staff the immediate head of the various bureaus of the War Department and practically gives him the control of them. Such an enactment with regard to the Navy would naturally be followed by efforts for fixed tenure of office and for steadily enlarging power. It might tend to an undue increase of expenditures, which are already necessarily great, by committing them to an official who is permanently identified with only his own profession and is not under the responsibility of a civilian member of a general administration which is directly accountable to the legislative branch of the Government and is subject to an early return to the criticism of popular elections. It is also likely to tend to professional jealousy—

I call your attention to that fact; the wisest officers in the Navy understand very well that its administration is very much better in the hands of a civilian—

on the part of naval officers toward one of their own number exercising the function of Secretary, while there is none toward a civilian exercising that function, who goes utterly out of sight after a short term.

That is the Secretary. Mr. Chairman, you will observe a little soreness on the part of officers who have a grievance toward the Secretary.

If there is under the present system sometimes a little soreness on their part toward the Secretary, as, of course, there now and then is, they can take it out by growling—

This is John D. Long, ex-Secretary of the Navy, who is speaking now—

and calling him an uncomplimentary name; but they have, perhaps, for that reason, no jealousy of one with whom they have no question of permanent rank.

Now, John D. Long says it is not a wise thing.

Command of a ship or fleet is different from the command of the whole Navy. The former gives its possessor necessary and readily accepted control over his immediate subordinates for a limited period and within a limited range, the latter over the naval fortunes, the assignments to continuous duty, the whereabouts on the face of the earth of every officer in the service.

To be sure, the Army act above referred to gives this supervision to the Chief of Staff, "under the direction of the President, or of the Secretary under the direction of the President." But with a Chief of Staff well in the saddle, it is easy to see how slight a check upon his mastery this provision would be, especially hereafter when a new Secretary comes in and is consciously subordinated to what he is led to regard as the customary order of things. Besides, the act will be a stimulus to the Chief of Staff to hereafter seek always direct communication with the President; and a President with aggressive force would easily

come to deal directly with the official who by such a law is made the real working head of all the bureaus and machinery of the department.

Under such circumstances the Secretary could hardly fail to lapse into a figurehead in the administration of the Navy and really to have no other function than to sit in an advisory capacity at the Cabinet table. Precedent quickly hardens into an inflexible system, and the first step should not be taken toward a military head of any department of the Government.

That is from John D. Long, who was one of the wisest and ablest men of his day in America, a philosopher, a scholar, and a patriot, at a time when he realized these responsibilities and duties, and he has placed it on record, and I wish to put it in this record as the best defense and the wisest defense of the American policy that I have ever read, and I put it there as a complete refutation of all you have heard of Prussianizing our Navy. Every argument you have heard, every letter you have had written to you advocating giving the Chief of Operations more power, ought to be judged as a proposition to make Von Tirpitz Secretary of the Navy of America, and to put Prussianism in its place. No man of character, no man of ability, no man of self-respect, no able man worthy of the place would accept the job when he is made a figurehead and a rubber stamp.

SIMS'S OBJECT THE REMOVAL OF CIVILIAN CONTROL, MAGAZINE WHICH IS PUBLISHING HIS ARTICLES STATES.

That one of Admiral Sims's chief objects in writing his letter of January 7 and bringing about this investigation, was to curtail the power of the Secretary and remove the Navy, so far as possible, from civilian control, is stated by the magazine which is publishing admiral Sims's articles on the Navy. In its March issue the *World's Work* has a long editorial headed, "Admiral Sims and Mr Daniels," in which it states, regarding the Sims's letter, that "In order to understand the document clearly, it is essential to understand the motive which prompted its preparation," and in the course of the article says:

The thing that is lacking in our Navy Department is the professional standpoint. There is no other great navy whose civilian head can control its military operations, both in peace time and in war.

Now, that statement in *World's Work* is not true. There is no English-speaking nation in the world, and there is no democracy in the world, where the civilian head does not control the operations of the navy in peace and war. He is provided with technical assistants, men eminent in the profession; but the last word in England, the last word in France, the last word in Australia, the last word in any country under the sun that is a democracy, is that a civilian secretary of the navy, who has a seat in the civilian cabinet, who presents naval needs to a civilian congress, and the naval officers and naval men must always, in the American or in any democratic nation, be subject to the civilian authority.

In Great Britain the civilian head can not issue a single order affecting the disposition of ships or their military operations without the approval of his military advisors. * * *

In this country civilian control is supreme, even in time of war; Admiral Sims believes that this is a great evil, that it might produce the most calamitous results, and that the military powers of the secretaryship should be curbed.

There it is, plainly stated.

Mr. Chairman, if Congress believes that civilian control is a "great evil," that the policy which has prevailed from the foundation of our Government should be reversed, and that the Navy should be removed from civilian control, let it follow Sims's lead—if the World's Work has quoted his reason and motive correctly, let it follow Sims's lead—create a general staff on the German model, and name some Von Tripitz to rule the Navy. But, Mr. Chairman, let us have no camouflage about it. Abolish the position of Secretary of the Navy, or provide that some admiral shall fill that post with a seat in the President's Cabinet. That would be the frank and open way to do it, rather than put some Sims in control of the Navy, with a nominal secretary as his clerk, messenger boy, and rubber stamp.

If this committee desires to raise that issue, I am perfectly willing to go to Congress and the country on it and let the American people and their chosen representatives make the decision.

The CHAIRMAN. Mr. Secretary, your charge of Prussianizing the Navy touches almost every officer who has testified before this committee. They have all testified in this respect—

Secretary DANIELS. I understand, Mr. Chairman, that you have written some letters to some officers of the Navy asking their opinion about organization.

The CHAIRMAN. Yes; I have written such letters to several of them.

Secretary DANIELS. To whom were they written? The reason I ask the question is this—

The CHAIRMAN. I mentioned that matter to a number of the witnesses in the hearings and stated my intention to write such letters.

Secretary DANIELS. The reason I ask that is this: This is the first time I have ever known the chairman of a committee to write to officers of the Navy except through the Secretary of the Navy. I do not object to that, and I should be very glad to have the officers of the Navy express their opinions to the committee through the Secretary of the Navy. It is establishing a new policy.

But what I desire to say is this: I desire to give you the names of other officers, because I apprehend that those to whom you have written are officers who advocate the plan of military control; but there are officers of the Navy, of high standing, who are just as much against that, who have not appeared before your committee, or who were not asked questions by your committee, who know that it is un-American and impossible. It would be manifestly proper that your committee should have laid before it the views of other officers of the Navy.

Now, I grant you, sir, that if you asked the majority of the admirals in the Navy who have been in Washington, before you, they would say that a naval officer ought to have absolute responsibility and authority. They are entirely wrong. If every admiral in the Navy would come before your committee and advocate that, you would never adopt it while the sun shines in the heavens and so long as this is a Republic. It has been attempted very many times before. It was attempted under Roosevelt's administration, and he opposed it. It was attempted under McKinley's administration and he opposed it. It was attempted under Arthur's administration,

and he opposed it. It was attempted under almost every administration we have had, and able admirals and distinguished admirals, splendid gentlemen, for whom we have the very greatest respect, advocate it; but they every one of them will begin and end with this: The Navy Department ought to be run like a ship. The captain of the ship ought to be the executive officer. And in this ship, as John D. Long points out, is the difference; that the Navy Department should not be run that way. Why, they forget that the business of the Navy Department is not only with naval officers. The Navy Department is in touch with shipbuilding and munition plants—as a matter of fact, there is not a business in America that does not touch the Navy somewhere. We buy direct, and we manufacture. It is a tremendously big industrial plant. Moreover, we must not forget it has a number of very able and distinguished high ranking officers of the line that have never felt that other officers in the Navy ought to have the voice and power that they are entitled to. You can not run the Navy by line officers alone. You can not run it by staff officers alone. They have got to work together. And when I came to Washington, Mr. Chairman, you know that a man who was an admiral who was Paymaster General or Surgeon General or Chief Constructor or in any staff position, could not be called commander or captain? He was not permitted to have his rank. You had to call him “paymaster,” or you had to call him “doctor,” or you had to call him “surgeon.” That was not so anywhere else in the world.

Line officers have their great duties, and they are the most responsible men in the Navy; and in operating ships, in navigating ships, in commanding fleets, their word must go. They must do that. But the great operations of the Navy take it all in. Take the Secretary's council. Who compose it? The Secretary of the Navy, a civilian; the Assistant Secretary of the Navy, a civilian; the Chief of Operations, a line officer; the Chief of Ordnance, a line officer; the Chief of Navigation, a line officer; the Surgeon General, a great physician; the Paymaster General, one of the ablest business men in America; the Chief of the Bureau of Yards and Docks, a civil engineer. So that we have there the working together of civilians and staff officers and line officers; and that is absolutely essential for successful operation. And so I would suggest to you that if you are securing opinions, they should not all come from men who believe that we ought to Von Tirpitz the Navy, or Prussianize the Navy, or make a Navy in which a line officer shall really be virtually Secretary of the Navy; because you have the opinions of such distinguished men as Admiral Badger, Admiral Fletcher, Admiral Strauss, Admiral Taylor, Admiral Griffin, Admiral MacGowan, Admiral Braisted, men of other views in the Navy; so that your committee should have a fair discussion of the matter. Have you written to all the bureau chiefs?

The CHAIRMAN. No; I have not.

Secretary DANIELS. I should suggest that you do.

The CHAIRMAN. Let me make a statement, please?

Secretary DANIELS. Yes.

The CHAIRMAN. As to your suggestion that we are writing simply to those who are in favor of certain things, there is nothing of that sort at all.

Secretary DANIELS. I did not mean to say that you were going that intentionally.

The CHAIRMAN. We want to get as many good opinions as we can.

Secretary DANIELS. Good!

The CHAIRMAN. This committee hopes to get something out of this investigation that will be of value to the Navy, and hopes that it will profit by the lessons of the war.

Secretary DANIELS. Very good!

The CHAIRMAN. I would be very glad to show you a list of those I have already written to, and I should be very glad if you would supplement it with others.

Secretary DANIELS. That is all right.

The CHAIRMAN. And then we will have the facts fully brought out. In fact, we asked them to do this so as to save time and so that we would not have to have them come before the committee.

Secretary DANIELS. I think that is very wise; but all that I had heard of who had received letters were men who were in favor of ousting civilian control and having military control.

The CHAIRMAN. I recall, for one, that we wrote to Admiral Badger.

Secretary DANIELS. I just said all those I had heard about, Mr. Chairman.

The CHAIRMAN. I do not think he recommended that.

Secretary DANIELS. But if you have received them, Mr. Chairman, it does not make any difference what they say; not the slightest. The genius of this great American Republic will never turn over the Navy Department to military control, either openly or under any camouflage. It will never give up to any naval officer control of the Navy Department. Very many naval officers want that. I have no quarrel with them. We talk about it openly, and have done so for seven years. But it is fundamentally wrong; and whenever you have taken the authority and given it to a naval officer to control all the activities of the Navy Department, the next thing they will want is to oust the civilian Congress from control; and the next thing they will want is to oust the civilian President from control and put a Von Tirpitz in control of the Navy and a Ludendorff in control of the Army; and I would fight it if I was the only man alive, on principle, to the end of time; and when it is done Americanism is ended in our Government.

The CHAIRMAN. A number of answers have already come in, and I do not think you will find, when these are published, that they go as far as you say; that they want to Prussianize the Navy.

Secretary DANIELS. No; but I think you will find it is true, Mr. Chairman, that every man who writes you says he wants to give to Naval Operations direct responsibility, says that he does not want the conditions Prussianized. He says, "Of course we want a civilian Secretary. We want a figurehead up there. We want a rubber stamp. We want a man to sit back and sign his name 'here,' and have no authority." And you will find it running through it all. They frankly tell me—the best friends I have, "Mr. Secretary, why, of course, we believe that naval officers are better fitted for this job." Well, I have no question about their being better fitted for

any technical job than any civilian we can get; but their very training unfits them for the duties of Secretary of the Navy.

The CHAIRMAN. You think it is a good idea, do you not, to investigate this matter and find out what reasons they have for wanting to do this?

Secretary DANIELS. Oh, absolutely; and I think their opinions might well be—but, Mr. Chairman, I think when all the opinions come in, no service should be permitted to dictate its organization. That must be done by the American people.

The CHAIRMAN. Well, I will say to you, Mr. Secretary, that what the committee purposes to do and expects to do, is to have a commission appointed, such as the Mahan commission, which will be made up of experts and which shall have civilians on it as well as naval officers, which can go over these different plans and make some recommendations that will go to Congress, which will have some weight.

Secretary DANIELS. That is right.

The CHAIRMAN. And this committee does not consider that it is a committee of experts; but the commission which will be appointed will be experts.

And further, Mr. Secretary, if it is not proper in your opinion for a committee of this sort to deal directly with the officers of the Navy, I think it should be proper. We are taking them simply, as I say, as witnesses.

Secretary DANIELS. I raise no question about that, because my policy has always been—when I became Secretary, it was the general policy that every officer who came before the Congress should first consult the Secretary of the Navy before he came up. I gave the order that every officer, the chief of any bureau, on any appropriation, when he should come before the committee, should tell them exactly what he personally thought ought to be done. If I had cut the appropriation down from \$10,000,000 to \$5,000,000, he ought to tell the committee that he had recommended \$10,000,000 and that it had been cut down; that he ought to give to Congress absolutely every fact that the department has got. And then, if I recommended \$5,000,000 and the bureau chief recommended \$6,000,000, it should be for Congress to say what should be the amount, with all the facts before them. It is the wise thing to pursue an open policy with Congress. So that I did not raise the question to suggest that anything had been done that was not entirely all right, but that if all these questions were being sent, I should request that you should not ignore the staff officers of the Navy and other officers of the Navy who have had large experience, and whose judgment, of course, is as good as the judgment of other officers.

The CHAIRMAN. I remember, during the hearing, speaking to Admiral Fletcher about the matter, and asking him to submit a plan; and, as I recall the testimony, he stated that his testimony would take the place of a plan.

Secretary DANIELS. Now, he is one of the ablest and wisest men in the Navy, and he is an officer—I think Admiral Fletcher was largely responsible for some of the organization Mr. Meyer had. He is an officer who understands that any particular organization or plan is not perfect, and his view is entitled to consideration; and so are all

these officers; and I submit, when you receive them all, any officer in the Navy who comes to this Congress and says to overturn, either by direction or by camouflage, civil control of the Navy, is advocating to you an un-American policy, a Prussian policy, a Von Tirpitz policy; and you can no more get the Americans to adopt it than you could make Von Tirpitz the Secretary of the Navy; and I have said to these officers directly and frankly and in the most friendly way, "What are you doing? You are advocating to un-Americanize America. You are going to put in office an admiral who is going to be in control and make the Secretary a rubber stamp." Well, of course, no man will take the position of Secretary of the Navy and be a rubber stamp. You will get a thing to do it, but no man would ever go in there when he was not the real Secretary of the Navy.

The CHAIRMAN. The answers that we get from these officers will show us the suggestions that they have to make, and these answers will all be considered by the commissioners that later will be appointed.

Secretary DANIELS. Yes. No department of the Government functioned more promptly and successfully than did the Navy Department during the war, and the organization was so efficient that no change whatever was found necessary. That it is far superior to any organization that ever existed before in the Navy, even the most persistent advocates of a General Staff admit.

How well it supplied the needs of the department was set forth by Admiral Benson in a speech to the Naval Academy Graduates' Association on June 1, 1916, in which, after describing the many improvements in the Navy, he discussed the naval organization and its efficiency, saying:

Cooperation between the various bureaus and offices of the department with the office of the Chief of Naval Operations has been most cordial and complete and the practical result has been all that could be desired. One day in each week the Secretary holds in his office a council composed of the chiefs of bureaus, heads of the various offices, the Assistant Secretary of the Navy, and the Chief of Naval Operations. At these meetings various questions of importance affecting the whole service are considered, the progress of work on ships discussed, new enterprises gone into, and a decision arrived at under the most favorable circumstances for wise action. Through these councils all are kept informed of important work, and a hearty cooperation followed by satisfactory execution of the Secretary's decisions is the result. In addition to this weekly council the Secretary of the Navy, through his own efforts, has organized a naval advisory council, known as the Naval Consulting Board, which, with his approval and sympathy, is collecting vast stores of information regarding the industrial resources of the country, and is perfecting a plan for the utilization of these industries for the support and assistance of the Army and Navy for the defense of the country in time of need.

A thoughtful consideration of the work that has been accomplished will show that all is being done now that could reasonably be expected from a so-called General Staff. In my opinion, the organization that exists in the department, and that is now in successful operation, is accomplishing in a purely American and businesslike manner all that could possibly be expected from the creation of a General Staff, and is, I believe, doing this in a much more satisfactory way. It is folly to talk of or to advocate clothing a Chief of Staff or a Chief of Naval Operation with authority independent of the head of the Navy. Such independent authority would lead only to confusion, and would do great harm. The fact that the bureaus, as now constituted, represent the different sections of the General Staff, that they have their special appropriations and are responsible for the proper development and operation of the various parts of the Naval Establishment under their cognizance, gives, in my opinion, to the organization of the Navy Department a distinctive strength and an added

efficiency not possible under a so-called General Staff organization. The present organization should be made stable and permanent, and if legislation is necessary to make this absolutely sure, then there can be no doubt that such legislation should be enacted, but in considering any legislation care should be taken that too great restriction is not imposed upon the freedom of action of the head of the Navy.
